Pil. Digitalis (Davies, Rose)

0.1 Gram $(1\frac{1}{2} \text{ grains})$

Physiologically Standardized

Each pill contains 0.1 Gm (1½ grs) Powdered Digitalis, produced from carefully selected leaf of Digitalis purpurea, therefore of an activity equivalent to 1 U S P XII Digitalis Unit

When Pil Digitalis (Danies, Rose) are dispensed on a prescription, the physician is assured that the patient receives digitalis in its completeness and obtains the full benefit of the therapy

Trial package and literature sent to physicians on request.

Experience is the Best Teacher

JOHN HUGHES BENNETT (1812-1875) proved it in histology

Bennett's experiences, gained by linking physiology with clinical medicine, led him to institute the practical study of histology, to recognize the medicinal value of cod liver oil, and to be the first to describe the blood condition leukemia — Bennett's disease.

DURING the wartime cigaretté shortage, people smoked many different brands—any brand they could get. And as they smoked—they naturally compared the different brands for taste, for mildness for coolness for all round smoking enjoyment. More and more smokers found from the experience of those comparisons that Camels suit them best.

Result? More people are smoking Camels than ever before!

According to a Nationwide survey:

More Doctors Smoke CAMELS than any other cigarette

Three nationally kn wn independent research organizations asked 113,597 dectors - in every branch of medicine - to name the eigenette they smoked. More doctors named Camel than any other brand.

histamine control in

In its pronounced ability to control allergic manifestations Hydryllin is outstanding among antihistamime agents

Of great significance also is diminished incidence of side reactions — drowsiness, central nervous depression and the like

Thus, with Hydryllin therapy, the patient experiences desirable therapeutic relief with minimal undesirable manifestations

NEW YORK 21, N Y

The anesthetic analgesic vapor* from Eskay s Oralator is delivered by inhalation through the MOUTH directly to the lining of the trachea and larynx—where it acts almost instantaneously to control cough. The patient gets relief in a matter of seconds.

directly

This local therapy produces no appreciable systemic effects, and thus avoids the depressant action of sedatives and narcotics

Eskay's Oralator is outstandingly convenient—easy to use anywhere at any time Your patients will appreciate your prescribing this quick acting oral inhaler Smith, Kline & French Laboratories Philadelphia

Eskay's Oralator

A revolutionary advance in the treatment of cough

CHOLINE

For a Better Prognosis

In Chronic Hepatitis

Laennec's cirrhosis (alcoholic, atrophic, portal or diffuse nodular cirrhosis; hobnall liver, gin drinker's liver) is the most common form of hepatic cirrhosis. Recent work indicates that alcoholism plays only a secondary role in the etiology of hepatic cirrhosis; the primary causative factor is that of a chronic, multiple nutritional deficiency

The first stage in the etiology of chronic hepatitis (cirrhosis) is probably that of a fatty infiltration induced by alcoholism; by diets high in neutral fats or cholesterol by the effects of toxic agents such as chloroform or carbon tetrachloride; or by an inadequate intake of protein, carbohydrates, vitamins and lipotropic agents

Fatty degeneration is followed by necrosis and atrophy of functional liver cells. The recognition of liver dysfunction is often delayed until signs and symptoms indicate an advanced stage of hepatic insufficiency. Today, through recognition of the role of nutritional deficiency in cirrhosis, emphasis has shifted to early diagnosis and treatment. The prognosis in chronic hepatitis is changing from poor to good.

Syrup Choline Dihydrogen Citrate (Flint), a stable and completely palatable form of the lipotropic agent, choline, is indicated in conditions in which hepatic dysfunction may be associated with impaired lipid metabolism

Syrup Choline Dihydrogen Citrate (Flint) — 25 Per cent W/V—is supplied in pint and gallon bottles

NEW adaptation of ARGYROL

ARGYPULVIS

for combined office and home treatment of TRICHOMONIASIS

The proved effectiveness of ARGYROLAS a protozoacelal, bacteriostatic and detergent agent of choice is now made available in a new field of application

As amply demonstrated in the work of Reuch Button and Nechtow* ARGY PULVIS fully utilizes thus protozoacidal property in a form most readily adapted to essential office treatment and supplementary home regimen

Also the bacteriotatic, detergent and demulcent properties of ARGYPULVIS offer additional advantages in the treat ment of cervicitis and vagnitis associated with Trichomomiasis — further reasons for its proven efficacy

Composition

Physical Properties

ARGYPULVIS contains powdered ARGYROL (20%) Kaolin (40%) and Beta Lactose (10%) finely milled to provide the

fluffiness which makes for casy insufflation, and with an attraction for water which promotes fast action

INTRODUCTORY TO PHYSICIANS On request we will send professional samples of ARGYPULVIS (both forms) together with a reprint of the Reich Button Nechtow report

IT IS GOOD PRACTICE

in judging the irritant properties of cigarette smoke, to base your evaluation on scientific research In judging research, you must consider its source*

PHILIP MORRIS claims of superiority are based not on anonymous studies, but on research conducted only by competent and reliable authorities, research reported in leading journals in the medical field

Clinical as well as laboratory tests have shown PHILIP MORRIS to be definitely and measurably less irritating to the sensitive tissues of the nose and throat. May we send you reprints of the studies?

White's

In the treatment of hypochromic anemias particularly iron-deficiency anemia of pregnancy gastro-intestinal iron tolerance is of paramount importance to both clinician and patient

White s Mol Iron—a new molybdenum iron complex—will therefore, prove of especial clinical interest. Recent clinical investigations in which Mol Iron was compared with ferrous sulfate, showed

substantially reduced incidence of gastrointestinal side-effects, as well as more rapid hemogenesis with a smaller intake of therapeutic iron over fewer treatment days

Try Mol Iron in your most iron intolerant case of hypochromic anemia Confirm for yourself the more rupid therapeutic action and greater freedom from side-effects

White s Mol Iron is a specially processed co-precipitated, stable complex of molybdenum oxide 3 mg. (1/20 gr) and ferrous sulfate 195 mg. (3 gr)

In bottles of 100 and 1000 tablets

(Forther) The factor

close the door...When the patient requires sedation, administration of DORMITOL*

compound gently but firmly closes the door on nervous symptoms and induces restful refreshing sleep

DORMITOL

Compound

Sedative and Hypnotic

Pleasingly flavored liquid preparation combining the values of phenobarbital and strontium bromide in securing optimal response with minimum after inertia Strontium bromide complements the action of barbiturate and reduces the amount required

DORMITOL is sugar free and may therefore be used for diabetic patients requiring sedation Prescription of DORMITOL does not reveal presence of phenobarbital to the patient

Each teaspoonful (about 4 cc) of DORMITOL COVIPOUND provides 1/4 grain phenobarbital, 1 grain strontium bromide, in 20 per cent alcohol vehicle SUPPLIED In clear glass bottles containing 8 fl. oz. and 1 gal.

Now More Than Ever The Physician's Advice Is Needed

Much confusion has resulted in the public's mind because of the conditions prevailing in the food field Lessened food availability, the need of many people to economize, and the desire to cooperate with the government's aim toward world relief, may well lead to deterioration of the nutritional state, unless competent guidance is offered

The physician's advice appears particularly important in the realm of protein nutrition. Lack of appreciation by some people for the more economical cuts and grades of meat, as well as the variety (or organ) meats, frequently interferes with the use of these excellent sources of high quality protein

All meat, whatever the kind or grade, or organ meat, supplies the essential amino acids indispensable for body main tenance, growth, repair and many other essential functions

Furthermore, all meat—regardless of cut or kind—is 96 to 98 per cent digestible.

By encouraging wider utilization of lower priced meats the medical profession can render a real service to budget conscious patients in maintaining the quality of protein nutrition and the wholesomeness of the daily diet

> The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association

When does a man start slipping?

The moment comes to every man

The moment when he realizes that he isn't the man he used to be

That the days of his peak earning power are over

That some day not so very far away some younger man will step into his shoes

When does this time come? It varies with many things

But of one thing you can be sure It will come to you as surely as green apples get ripe—and fall off the tree

Is this something to worry about? Well, yes But constructively For that can lead you to save money systematically

What's the best way to do this? By buying U S Savings Bonds automatically Through the Payroll Savings Plan Or the Bond-A-Month Plan at your checking account bank

Either method is practically foolproof It's automatic You don't put it off There's no "I'll start saving next month"—no "Let's bust the piggy bank"

And you get back four dollars, at maturity, for every three invested

So why not take this one step now that will make your future so much brighter?

Get on the Payroll Savings Plan—or the Bond-A-Month Plan—today

<u>Sure saving because it's automatic—U.S. Savings Bonds</u>

EXCELLENT SUPPORT for the

PENDULOUS ABDOMEN

Same patient after application of support (skeleton indrawn)

Clinicians are calling attention to the ill effects of the pendulous abdomen more frequently than formerly

Research discloses that the increased weight of the abdomen carrying the center of gravity forward puts strain on muscles of back and feet that ultimately round shoulders and increased cervical and lumbar curves develop, that the diaphragm and abdominal viscera lie on a lower plane than normally that eventually respiratory and circulatory symptoms appear

S H Camp & Company recognizing this proportionate irregularity and the frequency of its occurrence, has made supports for many years for these obese persons and for those in whom the obesity is largely confined to the abdomen

Camp surgical fitters are taught to fit patients with pendulous abdomen in the reclining position thus the intestines are redistributed to the sides and back of the abdomen and the support will hold them there

The Camp Support illustrated is especially efficient in holding the viscera in their redistributed position by reason of the support given to the pelvis

NEW YORK CITY

MAY 17 TO 21, 1948

In the opinion of many clinicians, "politic distortion is the most serious result of rickets." Severe deformities which "obstruct childbirth and may cause death of both mother and infant" as well as "the so-called 'simple flat politis" are often "rachitic in origin". In the prevention of rickets and other vitamin deficiency syndromes, the use of VI Penta Drops Roche offers dinkally important advantages. The drops are willingly taken even by difficult patients since they are miscible and may be added to milk, fruit juice or other foods without significantly affecting the flavor. The comprehensive formula of VI Penta Drops supplies in each 10 minim dose no less than 1000 U.S.P units of vitamin D plus ample amounts of vitamins A, B1, B2, C and niacinamide VI-Penta Drops are available in 15 cc and 30-cc vials. For a free trial supply, write to department V-3, Hoffmann-La Roche Inc., Roche Park, Nutley 10, New Jersey

The Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held at the Hotel Pennsylvania, New York City, May 17 to 21, 1948 We give these dates editorial mention at this time to call the attention of the physicians of the State to an event which will be of more than usual interest this year Mark it well, and if you can attend, write now for hotel reservations. Events will come with a rush in 1948, so use that new appointment book to jot down now the dates of May 17 to 21 Make your plans now to attend

Hotel space is difficult to obtain and is at a premium in the larger cities.

The District Branches

Part I

Once a year, usually in the Fall, the District Branches hold their meetings throughout the State of New York. Like many other accomplished facts they are too often taken for granted, their origins are lost in the dim recesses of history When were the District Branches founded? Why? Are their purposes and functions now what they were originally?

Behind the formation of the Branches less a dramatic story It begins in May, 1846, when a resolution was introduced in the National Medical Convention in New

¹ History of the American Medical Association, Saunders, 1947 p. 35.

York calling for the appointment of "a committee of seven to report a code (of medical ethics) " The committee was directed to report in 1847 at a meeting to be held in Philadelphia in May The committee fell to work and examined a great number of codes of ethics adopted by various societies in the United States. It concluded that they were all based on the code of Dr Thomas Percaval, who was graduated from Leyden in 1765 and who became a Fellow of the Royal Society of England in the same year In 1803 he published a series of ethical principles for the guidance of the conduct of the hospital

and infirmary of Manchester This code, substantially unchanged, was presented for the "committee of seven" by Dr Isaac Hays at the National Medical Convention in Philadelphia in 1847

In 1823 the New York State Medical Society had adopted a code of ethics which was "almost wholly similar to the code prepared by Thomas Percival" Thus both the code of ethics of the New York State Medical Society and that of the American Medical Association derived from the same source but at different times

At the annual meeting of the New York State Medical Society in 1881² a committee was appointed which drew up a new code of ethics "to be substituted for the one then in force" It was adopted in February, 1882, but met with "considerable opposition from many of the County Societies"

In June, 1882, the American Medical Association at its annual meeting in St Paul refused to accept the credentials of the delegates from the Medical Society of the State of New York, or to admit them to its proceedings because of the adoption of the revised code Now the fat was in the fire, and began to burn brightly The curious anomaly arose that the State of New York which, in 1847, had been the moving spirit in the formation of the American Medical Association was excluded from the proceedings of the very society it had created The backfire was sudden and caused a rupture in formal relations2 that endured for nearly a quarter of a century

In the State of New York the medical profession, in 1883 at the time of the annual meeting of the State Society, was in more or less turmoil The national or "old code" had been supplanted by the "new code" Now a resolution was offered at the annual meeting in 1883 "which was meant to take the place of the formal code of adopted in the previous year This resolution was carried." In effect it stated that "the only ethical offences for which the profession of New York claim and promise to exercise the right of discipline are those comprehended under the commission of acts unworthy a physician and a gentleman" The Medical Society of the State of New York thus formally became a "no code" organization 2

A poll of professional opinion was taken and it was found that

- 2,547 physicians wanted the national code
- 1,040 physicians wanted the new code 239 physicians wanted no code 34 physicians were unclassified

As a result of this canvass a new society, the New York State Medical Association. was organized in 1884

The District Branches

Part II

Under the energetic guidance of Dr Austin Flint and other supporters of the national code, a preliminary convention to form the New York State Medical Association was called, February 4 and 6, 1884, in the City of Albany 1 Omitting the debate, now inconsequential, which preceded the resolution offered by Dr Gouley relating to a plan of organization,2 we find that the first item in this plan was one to facilitate the transaction of business Dr Gouley

t Trans New York State Medical Ass n 1.504 (1884)

* Ibid p 528.

proposed that "the State shall be divided into five geographical districts, to be called, respectively, the 1st, or Northern District, the 2nd, or Eastern District, the 3rd, or Central District, the 4th, or Western District, and the 5th, or Southern District

"These districts shall comprise the sixty counties of the State " Dr Gouley's resolution was unanimously carried

Here then for the first time appear the five Districts, formed "to facilitate the

² History of the Medical Society of the State of New York T J Walsh 1907 p 204 ² Trans State Soc 1883 p 78

² Note that in 1884 Nassau County was not yet for

selection of committees, the annual election of officers and of new members" Other significant items contained in the resolution were "The code of ethics, which shall form an integral part of the by-laws of this Association shall be the same as that adopted by the American Medical Association"

The New York State Medical Association was incorporated under Chapter 207 of the Laws of 1875, May 3, 1884 A plan of organization of five branches of the Association was presented and adopted November 18, 1884 The already established County Societies were affiliated with and were component parts of the Medical Society of the State of New York This fact posed a serious question Would it be necessary to create new County Associations? Preponderance of opinion seemed to be that it would not, those County Societies that adhered to the national code could be considered as in affiliation in fact if not by statute with the State Association creation of the Branch Associations would afford organizations "that could conveniently be attended by physicians throughout the State " County Societies were "too small for pleasant and useful work." The case was different with respect to District Branches, each branch covered an area of from 10 to 14 counties, and the attendance at these meetings was sufficiently large to favor better scientific papers and discussion

It is difficult for the doctor of today to consider his medical organizations to have been other than they are now It is true that fundamentally all the doctors' organizational work has had the objective of the promotion of better medical education, better ethical concepts of the relation of the physicians to other physicians and to the public, the provision of better public health and the advancement of the science and art of medicine In the nineteenth century the attitude of the regular profession toward the downright quacks, and the irregulars (homeopaths and eclectics) was in the main uncompromisingly hostile But it appears from the Transactions of the State Medical Association that control of the other Society (The Medical Society of the State of New

York) had been captured prior to 1884 by certain elements in New York County and similar groups in other County Societies who were not supporters of the national code of ethics, who were, on the contrary, proponents of the "new code" of 1882, and included some who favored "no code". These gentlemen were not averse to consultation with "irregulars," a practice not permitted by the national (or Thomas Percival) code of the A.M.A.

It will be noted that, in 1883, the poll of physicians in New York State who wanted the national code was 2,547. This number represented the potential strength of the new Association, but even so "it was realized that with the constitution of the State Medical Society as it then was and with the membership as determined by it, it would be practically impossible to obtain any legislation of such a nature as would bring about a reunion with the national body"?

The five branches of the new State Medical Association created in 1884 were the beginnings of the present-day District Branches.

There had been districts previously established Examination of the Transactions of the Medical Society of the State of New York's shows that "The Society then (1808) proceeded to arrange its members into four classes, according to the four great senatorial districts of the State" Thus the original State Medical Society did have, in 1808, a somewhat similar district arrangement. These districts were Middle, Western, Eastern, and Southern Note, however, that the number was four

In 1884, the seceding State Medical Association did not have the County Societies as components. These had been established by statute as components of the Medical Society of the State of New York in 1807 And the Medical Society of the State of New York with its component County Societies was the official organization of the medical profession of the State at all times

Thus the five Branch Associations of the

Second Meeting, Albany First Tuesday of February 1808. See Transactions for detailed account.

seceding New York State Medical Association were of the utmost importance to the new organization for administrative purposes

(To be Continued)

Developments in Health Legislation

According to a brochure published by the Research Council for Economic Security, study of the legislative record of 1947 shows "increasing interest in the establishment of compulsory health insurance systems and expansion of governmental health services"

Congressional legislative activity in the field of health apparently "tends to emphasize health services, either through a national compulsory health insurance system or through grants to states"

On the other hand, most state bills call for cash sickness benefits None of the bills in 1947, either State or Federal, became law

The Research Council comments on the importance of the increase in the number of bills, seeing therein a developing trend Says the brochure "In 1935–1936, ten bills were introduced in state legislatures, in 1945, there were thirty-nine bills, in 1947, there were fifty"

These fifty odd bills were introduced in sixteen state legislatures "calling for the establishment of compulsory systems of sickness benefits or health insurance"

The legislative proposals are broken down into six classes (1) Cash Sick Benefits—Monopolistic Type, (2) Cash Sick Benefits—Optional Type, (3) Cash Sick Benefits—Voluntary Type, (4) Unemployment Sickness Benefits, (5) Prepayment Medical Care, (6) Pregnancy Benefits

Important is the numerical breakdown of the six classes Of the fifty odd bills, twentyfive, or fifty per cent, fall into Class I In this type, benefits and coverage are "identical with unemployment compensation, and are to be financed by payroll taxes levied on workers and/or employers, varying from 1 to 2 per cent of payroll A monopolistic state is to be created for the payment of fund benefits, affiliation is compulsory, and there is no provision for alternative voluntary Of this class of bill, eleven plans were introduced into the legislature of the State of New York in 1947, and three in New Jersey and Massachusetts, respectively One each was introduced in Pennsylvania, Nevada, Minnesota, Maryland, Illinois, Connecticut, Arizona, and Alabama monopolistic state fund in this class of bill was modeled after the Rhode Island plan

At the commencement of a new legislative year, such a study is of much value. Is the trend of the past ten years likely to continue? Will the coincidence of an election year accelerate the activity? The report of the Research Council points out that failure of current bills to pass "does not mean that demands for this type of legislation is on the wane"

We have omitted detailed comment on the five classes of state legislation other than to list them. It appears obvious that in the State of New York, with eleven bills of the monopolistic type in 1947, six bills in class IV, one in class V, and two in class VI, the spread is wide with a slight emphasis on the monopolistic type of cash benefit. The value of such a survey to the medical profession seems to be to show the trend of thinking on the part of those proposing the legislation. A further report for 1948 will be awaited with much interest.

Current Editorial Comment

G P'S to Get the Works The coming four-day session of which an indication is given below should work out as an endur-

ance test, however much or little it may succeed as a postgraduate educational project

¹ Health Legislative Developments 1947 Research Council for Economic Security 105 W Monroe St. Chicago, Ill publication No 53

In addition to technical and scientific exhibits, a program designed particularly as postgraduate education for general practitioners will be presented at the supplemental session of the American Medical Association in Cleveland, Ohio, January 5-9, 1948.

The Council on Scientific Assembly, whose chairman is Dr Henry R. Viets of Boston, has prepared a program which will include papers. panel discussions, and symposia on many of the topics now most prominently before mem Among the bers of the medical profession topics to be covered are peptic ulcer, blood dyscrasias (any abnormal composition of the blood), the chronic invalid, nosthospital care of patients with cancer, treatment of the fat and the lean, cancer of the prostate, the use of BCG (Bacillus Calmette Guérin) vaccine in the prevention of tuberculosis, uterine hemorrhage, multiple injuries in automobile accidents, the treatment of pathologic conditions in adolescence, the treatment of the healthy and sick diabetic patient, jaundice, the Rh factor, and the interpretation of x ray films of the chest

During the first two days of the session the Council on Industrial Health of the American Medical Association will conduct a program devoted particularly to problems in its field

Planned for the Scientific Exhibit is a demon stration of the operation of a diagnostic cancer clime, in which visiting physicians will be given the opportunity to undergo themserves the routine of such an examination

We believe that the last-named feature, the demonstration of the operation of a diagnostic cancer clinic, should prove to be of great value One picture is better than a thousand words Dr Viets has outlined a most valuable program

Longovity of American Physicians

The expectation of life for physicians in the United States is essentially the same as that for the general white population at the same ages, according to a study by the Metropolitan Life Insurance Company based upon the records of deaths among active and retired physicians in the files of the American Medical Association The study covered the five-year period 1938 to 1942, inclusive. The average male physician entering his profession at age 25 has 43½ years of life before him. This represents roughly the average professional career of a physician under current conditions of mortality Upon reaching age 35, he still has, on the average, almost as many

years remaining as he has already lived. At age 45, the average physician may expect to live an additional quarter century, and at 65 often regarded as retirement age, he may still look forward to almost 12 years of life Women physicians start out with an advantage of 3½ years over the men at age 25, but this margin is reduced to less than 1½ years by age 65

The death rates for the physicians and the general population are practically identical at ages 75 and over

Those physicians who survive into late life, where they experience about the same mortality as the general population are presumably the hardier individuals, who may be benefiting from the advantages of an especially good heredity or a favorable environment, or both.

It would seem that the first hundred years remain, as we surmised, the hardest, for physicians as well as for barkeeps, plumbers, pretzel benders and/or farmers

¹ Statistical Bulletin, Metropolitan Life Insurance Co. (Aug.) 1947 p. 1

Health Instruction Necessary in the Schools. No one can say what is in store for this nation in the years to come The President of the American Medical Association recognized the fact, however, that, whatever is to come, the national health must be improved through health education in the schools

"If health is the nation's most valuable asset then it should be a number one topic for instruction in the schools," Edward L. Bortz M D., president of the American Medical Association, said in a speech prepared for delivery before the Conference on the Cooperation of the Physician in the School Health and Physical Education Program at the Hotel Moraine, Highland Park, Illinois, October 16, 1947

According to Dr Borts, the schools and organ ised medicine have been the objects of much unfair criticism because of the high proportion of young men found unfit for military service by Selective Service in World War II He pointed out that those who enlisted voluntarily in the first two years of the war and the others who were deferred because of essential occupation or dependency were not examined under Selective Service. Furthermore, only 19 per cent of the rejections were for conditions really preventable or correctable.

Nevertheless, Dr Bortz observed "It must be admitted that some stimulation is necessary in certain portions of the country to modernize the health and physical education program in all grades of the school, if the youth of the land are to make a better showing in the event of a third national challenge. He said that "in a large measure a modern educational program should include many of the activities which our great military leaders hope to accomplish through a program of compulsory training

"Basic facts concerning the rules of health should be included throughout the entire extent of the school curriculum," the AMA head "Good habits in regard to nutrition, remarked elimination, rest, and recreation should be developed in youngsters in their most impressionable years in the home, and the school curriculum atmosphere and extracurricular activities should solidly reinforce these early teachings, particularly providing full and scientifically accurate Concomitantly, physical health information examinations should be made at regular intervals. if not by the family physican then by the physician serving the school School physicians with the close cooperation of teachers have an unexcelled opportunity for instruction in the basic facts of healthful living as school children are being checked over for incipient defects, disease. or other short-comings Unhealthy emotional states, bad teeth, malnutration, muddy skin, constipation, and a number of other common discrepancies are usually quite readily identified Correction is not always as easily accomplished. but the physician can often point the way and create the desire to follow it

"A most wholesome sign," Dr Bortz continucd, "is the friendly cooperation between educational leaders and health authorities from the medical profession A modern health program for the schools of the various communities is an excellent subject for discussion with parentteacher associations, civic clubs, church groups. and various other auxiliaries and societies Such discussions, forums, and question and answer periods are excellent media for distributing significant information not only to members of the school population, but to others participating in the programs A school health program such as we visualize can best be worked out at the community level It will more likely succeed if encouragement descends from the state and national educational centers where policies are determined, and subjects for inclusion in the curriculum are selected

"Let us have a more healthy nation Let us get together on a plan of action that will clearly show youngsters and their parents that it is in their best interests that certain basic rules of health should become part of their daily living program. An enlightened public does not require compulsion and regimentation.

"A clarification of our national needs, supported by a modern program of instruction in health and the democratic way of life, is the surest guarantee for the nation's security. The development of such a program, to my mind, is the most important educational task which is facing our nation today."

Are Trimmings Necessary? In speaking of the necessity for every doctor practicing every kind of medicine to be constantly cognizant of the psychosomatic aspects of his patients, Dr 'Walter C Alvarez' says, "Our advice must always be practical, in other words, we must not tell the widowed scrub woman with five children to take a vacation in Florida Our speech must also be simple and colloquial"

The French have a word for it—"L'esprit de l'escalier" Freely translated, it means the bright remark you wish you'd made when engaged in flashing repartee with the guest of honor at the party, but which actually only comes to you after you have been left tongue-tied in the emergency and are shame-facedly descending the stairs that lead you to the drab home from which the suitably timed remark might have rescued you

Broadly speaking, there are two types of Those who, when Christmas approaches, take bands of children from the slums and escort them through the glittering marvels of the town's most modern toy store There the undernourished waifs see electric trains, meccano sets, French talking dolls, aluminum skis and other modern marvels too numerous to mention of the children had never dreamed of the existence of these anodynes for the relief of jaded childhood, but, when they have seen them, there is just one thing of which they may rest completely certain—that they will not personally possess any of them

The second type of person does not take poor children to the toy store the week before Christmas

These reflections cast a little light upon the problem of a patient which had recently baffled us

A happily married—so she said—woman of thirty-nine was childless. She had a happy family background, was happy in her job, and was of rather more than average intelligence. Seven years ago she suffered a bizarre but not very severe accident which caused her to be subjected to a spinal opera-

¹ Alvarez Walter C J.A.M.A 135 704 (November 15)

tion The operation had been successful in relieving her disabling pain, but in spite of the success of the operation she had since been, in her own words, "good for nothing" Hours of patient questioning revealed that before the operation her greatest pleasure, in her rare times off, had been to go "window shopping" Now she no longer had the

strength even for that It suddenly occurred to us that she might have graduated from the first class of people that we have just mentioned into the second Perhaps her subconscious mind had more sense than she had Perhaps it had told her that she and her husband between them, or together, would never be able to possess the beautiful things that, after the day's work was over, she dragged her weary limbs to see Perhaps it told her common sense indicated that she stay at home rather than waste her strength and deplete her morale by constant contemplation of the unattainable "L'esprit de l'escalier" almost made us call her back

We think our diagnosis very likely is correct, but to make any treatment effective what must we do? We must teach our patient to fling away ambition We must teach her that she and her husband are only average people She must abandon the vision of herself tripping into swank restaurants swathed in the latest thing in mink or sables We must strip every bit of gilt from her meager allowance of gingerbread We don't know whether we could do it if we tried. And we are not at all sure that we, on mature consideration, life being what it is, would wish to try

We yield to no one in our recognition of the necessity for the universal practice of psychosomatic medicine But we think it will do no harm to point out that the best intentioned of practitioners who tries to practice it may often find he has bitten off more than he can chew

Still, what is man's reach for, if not to exceed his grasp?

New A.M.A. Public Relations Counsel. Dr George F Lull, secretary and general manager of the American Medical Association, announced recently the appointment of Lawrence W Rember as his executive assistant in charge of public relations

Mr Rember, who fills a post vacated by the resignation last June of Charles M Swart, assumed his new duties on December 16 At the same time, Dr Lull announced the appointment of the Chicago firm of Theodore R Sills and Company as public relations counsel for the American Medical Association

Mr Rember gained his experience in the health and public service fields as director of public relations for the Blue Cross Plan Commission of the American Hospital Association and as public relations director of the midwestern area of 17 states of the American National Red Cross

Mr Rember has served as assistant general manager of the public relations nutrition research agency of the poultry and egg industry, representing 28 national and regional trade associations. He received his master's degree from the Medill School of Journalism at Northwestern University and his Bachelor of Arts degree from the University of Wisconsin, where he special ized in journalism and commerce. He supplemented this education by teaching journalism and advertising at the Henry W Grady School of Journalism, University of

A member of the National Association of Public Relations Counsel and a director of its Chicago Chapter, Mr Rember is also secretary treasurer of the association and writer of its official publication

It is hoped that the doctors of the United States will now be in a position to carry forward a consistent and widespread effort to bring to public understanding the real values of a free and independent medical profession. The art and science of public relations is not a matter to be conducted haphazardly. And the public relations of the medical profession should be subject to the guidance of the best counsel available.

Human nature does not change radically One remembers that Martial wrote, undoubtedly interpreting the feeling of his time

Non amo te, Sabidi, nec possum dicere quare, Hoc tantum possum dicere, non amo te

Tom Brown interpreted this literally in his time

I do not love thee, Doctor Fell, The reason why I cannot tell, But this alone I know full well I do not love thee Doctor Fell

One may assume for purposes of argument that the good Doctor Fell was possibly some doctor of medicine who had ministered to Mr Brown during a seizure of gout Is Mr Brown stirred by emotions of

gratitude? Not noticeably "Fellow's a fool'," he probably muttered to himself between twinges Yet it may be presumed that the good Doctor Fell was doing his best for his patient, lacking evidence to the So in these modern times, with contrary many startling developments of medical science, better education of the profession, more effective methods of treatment to place in the service of ailing humanity, Dr Fell nevertheless is not wholly understood Mark you, neither in the time of Martial, nor in that of Tom Brown, nor yet today is there any specific reason stated for disgruntlement Some reasons there may be, a few there undoubtedly are, but they are not specified

Dr Fell in this day and age has much to give, much to say But he is at a disadvantage in speaking to the folks One way around that is to get someone to do it for him, someone who knows when and how Maybe some future poet may write

I still don't love thee, Doctor Fell, Because, when sick, I feel like hell, But this I know when sick or well, I have a friend in Doctor Fell

Doctor Fell is no longer just a single individual, even in his contacts with his patients. He is or should be the ambassador of hope, bringing cheerful greetings from a host of educators, research workers, hospital administrators, instructors in medicine, nurses, specialists, from all that vast army of mercy standing, if one visualizes them behind him, with one intent, one purpose, one ideal, the conquest of disease

Doctors' Help Urged in Accident Preven-In many ways doctors and health department personnel could be more effective than the police in preventing accidents, according to Edward Press, M D, a pediatrician with public health training who is regional medical director of the US Children's Bureau in Chicago in the November 29 issue of the Journal of the American Medical Association, Dr Press observes that "any problem that confronts the physician with 9,800,000 injuries severe enough to cause disability in a single year in the United States urgently demands his attention "He points out that in 1943 accidents were the leading cause of deaths in all children in the United States from one to 19 years of age

In 1944 accidents ranked fourth as a cause of death for the population as a whole,

preceded only by heart disease, cancer, and intracranial vascular episodes and still leading such notorious killers as tuberculosis, nephritis, and pneumonia

In 1945 motor vehicles caused only about one third of the accidental deaths. Almost one half of the others occurred in the home, where, the writer believes, safety hazards could be checked by visiting doctors, public health nurses, and others in similar positions much more tactfully than by members of the police department.

Besides the standard methods of promoting safety Dr Press suggests

1 Taking advantage of occasions in which a doctor's patients would be most "psychologically receptive" to safety education, i.e., when a baby is being inoculated against the various communicable diseases, or when a patient is being treated for some minor injury due to accident

2 Reporting of "accident-prone" diseases, such as epilepsy, alcoholism, or drug addiction, to the proper authorities

3 Requiring regular physical examination for drivers, including regular and stereoscopic vision, hearing, and reaction time

4 The use by civilians of identification tags which would include such items as blood group, presence of serum sensitivity, abnormal bleeding tendency and tetanus immunization

5 The registration and periodic inspection of bicycles, with the requirement of certain safety essentials

6 Treating children with unusual proclivities for accidents in psychiatric clinics

7 Integrating an accident prevention program into the structure of a local or state health department

8 More education in accident prevention technics for physicians and nurses at schools of public health

The appalling accident toll, mounting disability resulting from this cause, and overburdening of hospital facilities hampered by current nursing shortages make it seemingly imperative that physicians enter the campaign being waged by the National Safety Council and others, using the suggestions made above by Dr Press as a guide

The word "doctor" originally meant "teacher" Perhaps this aspect of the physicians' function has been neglected outside of the formal instruction given in medical schools and hospitals by medical men One can teach in the home, in the office, in casual conversation. It should be done more often

SUBSEQUENT CHILDBEARING OF PRIMIGRAVIDA PRESENTING A BREECH AT TERM

CLYDE L. RANDALL, M.D., and RICHARD W. BARTZ, M.D., Buffalo, New York

(From the Obstetric Services of the Buffalo Children's and Buffalo General Hospitals)

WE KNOW there is universal appreciation of the fetal risk when, at the enset of labor, a primigravida s child presents by the breech. The factors that influence the incidence of this complication have been analyzed repeatedly In all probability many of us should review our concepts regarding the occurrence and management of breech presentations. If the majority of breeches were due to so unalterable a factor as a contracted pelvis, there would be little reason to weigh a higher fetal risk against preservation of the primipara's ability to bear subsequent children by normal births In 1940, and again in 1945, Vartan published observations that have awakened interest, not so much in the etiology of breech engagement, as in the factors that seem to prevent cephalic presentation 12 His work has been substantiated in this country by Tompkins, who found evidence that a relatively small pelvis rarely accounts for the occurrence of breech presentation 14 Actually, large postmature babies usually present by the vertex, and breech presentations occur relatively often with small premature infants. Vartan noted the frequency of breech presentation during the eighth month of gestation and emphasized his conviction that spontaneous conversion to a vertex will occur unless (1) labor begins prematurely before the vertex has become engaged, or (2) a fetal attitude of extension, rather than flexion interferes with the occurrence of spon taneous version during the last weeks when engagement takes place.

Certainly there is little evidence that the vertex fails to engage because of some maternal factor that will persist to influence the course of labor when the same woman's subsequent preg

nancies reach term.

Management

The fetal and maternal risks involved in delivery when the first term child presents by the

Presented at the 141st Annual Meeting f the Medical Society of the State of New York, Buffalo Section on Obstatrica and Gynacology May 8 1947

breech have been studied repeatedly by Goethals, 3-7 Hansen, Higgins, Mohler, 10 Moore and Steptoe,11 Potter et al .12,18 Racker,14 Rucker,18 Tompkins, 4 4 Varian, 1 2 Voct et al .16 Walsh and Kuder," and Waters."

The experience and relative skill of the accoucher would seem to be a matter of paramount importance This thought has been expressed by Rucker,18 Stein,19 and Tompkins,3 4 the latter reporting a low fetal mortality when breech delivenes were conducted by a group of obstetric specialists. Hansen's report also suggests that excellent results can be obtained by conserva tive management in experienced hands ever, there are occasions when many of us would agree with the Potters, who state that increased personal experience with operative delivery does not guarantee better than average results when delivering a primigravida of a breech at term.

Authoritative oninion remains divided as to the advisability of active intervention Routine extraction under full anesthesia and not infrequent resort to elective section has been advocated by Bill.23 Goethals 4-7 Potter, 12,13 Vogt, 16 and others. However statistical comparisons of the results with varied management have been presented by Greig Moore and Steptoe, 11 and Waters, 19 all of whom, interestingly enough, conclude that conservative management gives best results in uncomplicated breech delivery. In most instances, after spontaneous delivery to the umbilious has been accomplished, unless disproportion, intrapartum bleeding, or a prolapsed cord appears, the conservative school recommends interference only to assist delivery of the shoulders and head Such management has been recommended by DeLee, 24 Hansen, Higgins, 9 Mohler,14 Nicholson,25 Schumann 25 and Tompking.

Conversion of the breech to a cephalic presentation by external version has been recommended by Higgins Slegel, 21 and McNally procedure recently has been evaluated by Rucker and Vartan but is generally, and probably rightly regarded as of very limited value.

We hesitate to believe the increased fetal risk indicates section, except when circumstances seem to justify the maternal risk involved While the maternal mortality in cesarean section is now generally low (it should not be more than 1 per cent), the figure ten maternal deaths in 1,000 sections, when compared to the New York State average approximating ten maternal deaths per 10,000 deliveries, reveals the operation as a tenfold greater risk to the mother as important to remember as the immediate operative risk, section leaves the woman predisposed to serious obstetric accidents in subsequent pregnancies Duckering recently reviewed the risks to both mother and fetus of delivery when the uterus contains the scar of a previous section 22 Obviously before electing a cesarean we should remember that the operation carries a tenfold greater maternal risk than vaginal delivery and that there are potentialities for trouble during subsequent pregnancies whenever we place a section scar in the uterus

All observers report a significant incidence of macerated or very premature nonviable infants born to a primigravida presenting a breech at the onset of labor It must be remembered that employment of elective section could not change either figure appreciably Moreover, an additional number of babies are viable but premature to a degree that makes dystocia an unlikely factor as far as the fetal risk is concerned Before the gestation reaches term, section would not be indicated unless premature labor began, and it is our belief that when premature labor begins section is not warranted. At term, when the baby seems large and dystocia might be anticipated, section should be considered In an obviously correctly selected group of cases, Potter has reported no fetal deaths among 80 consecutive sections when the indication for operation was the presentation of a breech by a primigravida at term On the other hand, it is evident that the routine employment of cesareans would not avoid fetal losses from prematurity or the antepartum causes of fetal death

We feel a decision in regard to the best method of handling the individual case should not be based merely upon knowledge of the fetal risks involved if vaginal delivery is elected. The eventual consequences of the type of delivery chosen upon the mother's subsequent child-bearing should also be taken into account. Long range considerations must be weighed if one contemplates operative intervention with its greater chance of maternal trauma, and is particularly to be considered when elective section is contemplated.

Material

This study was undertaken in the hope of gaining knowledge of the behavior during subsequent deliveries that could be anticipated, if the primigravida delivering a breech at term were so managed as to safeguard primarily her ability to carry subsequent children to term and bear them through normal labor No effort has been made to contemplate the subsequent fertality of women presenting their first child by the A shifting population and our mability to learn whether stenlity was voluntary or not seemed insurmountable difficulties if a significant number of patients were to be considered The cases selected have been chosen simply because in this number alone, reliable information concerning their subsequent obstetric history could be obtained

Our conclusions are based on a study of the records of women delivering in the Buffalo General and/or the Buffalo Children's Hospitals during the years 1937 to 1946, inclusive One hundred and seventy-nine histories proved adequate for analysis among the records of 898 breech deliveries occurring during this ten-year period, when a total of 23,241 women were delivered in the two institutions. While the number of patients considered is not large, we know of no reason why they should not represent a reliable reflection of the behavior that could be expected among the population at large.

Observations—The obstetric histories of 179 women whose first child at term presented by the breech have been reviewed. Seventy-six and five-tenths per cent of these patients were less than 30 years of age when delivered as primipara, and 8 8 per cent were 35 or more years of age. This is a rather high incidence of elderly primipara, considering that Walsh and Kuder¹⁷ reported only 2.74 per cent primiparas over 35 years of age among 29,683 deliveries occurring at the New York Hospital between September 1, 1932, and May 31, 1943.

Maternal Mortality —There were no maternal deaths, when the 179 women delivered breeches as primiparas, or during the subsequent deliveres since observed among this same group of women Only one of the 179, an "elderly primipara," was delivered by cesarean section. This same patient, delivered by section when her second child was born, was the only multipara sectioned.

Fetal Mortality—Considering the fetal risk involved in the vaginal delivery of a breech, it seems logical to omit fetal losses when labor terminates in the delivery of a nonviable child (weighing less than 1,500 Gm) or a macerated fetus. All neonatal deaths and all stillborns,

except those born macerated have been con sidered in calculating our fetal mortality rate. only the nonviable and macerated have been excluded in the thus "corrected" fetal mortality

Fital Mortality (as Principara) - Among the primigravidas under 30 years of age, the corrected fetal mortality was S 1 per cent, and among those over 35 years of age it was 83 per cent

There were 17 deaths among the viable infants born when these 179 primiparas were delivered of a term child presenting as a breech, a corrected fetal mortality rate of 89 per cent Another 10 7 per cent of infants were nonviable, macerated, or neonatal deaths, which accounts for the fact that only 144 of the 170 women (80 4 per cent) gave birth to normal babies that left the hospital with their mothers. For comparison, among 2,834 consecutive deliveries of primiparus (including all types of presentation and complications) at the Buffalo General Hospital, 92 9 per cent gave birth to a fetus that survived These figures are in agreement with many previously reported and suggest that the primigravida presenting a breech at term has four chances in five of taking home a normal childa figure acknowledging a fetal risk approximately three times the average loss among firstborn (Table 1)

TABLE 1 — Fetal Mortality Among 170 Women De livering a Breech as a Primpara Plus a Subsequent Delivery at Tray

Yumber of Patients Reported	Number of Breech Deliveries	ery Record as F Fetal Mortality (Corrected)	Total Babics Burylving
179	179	8 907	60 4% (average for BOH primipera— 92 9%)
	Deliv	ery Record as A Over-all	
	Presentation	Fetal Mortality (Corrected)	Total Babies Surviving
	Vertex, 141 (78 8%) Recurrent breech 38 (21 2%)	3 9%	88 5% (average for BGH multipara— 93 2%)

Fetal Mortality (as Multipara) -There were seven deaths among the viable infants born when these 179 women delivered their second child, for a corrected fetal mortality rate of 39 per cent. This is significantly higher than the 24 per cent fetal mortality average for all types of delivery in the Buffalo General Hospital during the years 1037 to 1946 However, among the 141 women who delivered their second child as a vertex, the fetal mortality was 2 13 per cent, suggesting that no maternal factor predisposing to more than average difficulty was present in the majority of cases

The incidence of nonviable infants was somewhat less than when these 179 women had de-

livered as primiparas, and 88 5 per cent of the group gave birth to a normal child that survived This compares fairly well with the average noted at the Buffalo General Hospital during the years 1937 to 1946 where, among 3 387 multiparas, 93.2 per cent gave birth to a child that left the Hospital alive

Although the small number of cases detracts from the apparent significance it is at least an interesting observation to note that the women who lost a viable baby as a primipara expenenced better fortune as a multipara One of the 17 had a nonviable premature child, of the remaining 16, all gave birth to babics that sur

TABLE 2 .- FETAL MORTALITY AMONG 179 MULTIPARAS

	-Subsequent Delivery of a Vertex-		
Number of Patients Reported Number		Fetal Mortality (Corrected)	
1 9	141 (78 871)	2 13%	
	-Subsequent Delivery current Breech		
	Number 38 (21, 2%)	Fetal Mortality (Corrected) 10 5%	
	38 (21 2.4)	10 0%	

Recurrent Breeches -It is interesting to note that when these 170 women came in for delivery of their second baby in 38 instances (21.2 per cent) the breech presentation had recurred (Table In this group the majority of fetal deaths occurred and the corrected fetal mortality rate was 10 5 per cent for delivery of breeches among this small series of multiparas. Four of these 38 women whose second child also presented by the breech had lost a viable first child, but fortunately none of the women, presenting a recurrent breech, lost both their first and second ahıld

Here again our series is too small to warrant conclusions regarding the management of com plications, but analysis of fetal losses suggests that accidents of pregnancy probably unrelated to the breech presentation often account for a fetal death. In this category we can hardly include prolapse of the cord since the occurrence of this complication might well be anticipated whenever a footling breech presents

Admittedly limited as this survey has been, it. nevertheless, suggests that with recurrence of a breech presentation difficulty should be antici-Certainly, it appears that the fetal

mortality incident to delivery of a breech is almost equally high among multiparas and primi paras. At least we would emphasize that the complications of pregnancy and labor which frequently prove fatal to the fetus occur as often

with breech presentation in the multiparas as among primiparas If section is justified to assure a live baby for the primigravida, it should be remembered that breech presentation in the multipara presents us with essentially the same problem. Induction of premature labor when the child presents as a frank breech, or elective section when disproportion or a footling breech presents, are recommended procedures that should be considered in each instance. We believe the employment of such measures in properly selected cases would save more lives than the routine employment of any procedure for all breech presentations.

Summary

The recent literature suggests that breech presentation is, in the majority of instances, due to factors existent within a particular pregnancy

Since breech presentation in the first gestation is but rarely due to maternal factors that persist in subsequent pregnancies, no more than an average number of obstetric complications should be anticipated when such subsequent pregnancies are delivered at term.

The ments of conservative handling often have been evidenced in comparative statistics, yet the relatively high fetal mortality frequently tempts us to subject the mother to greater risks in the hope of securing for her a healthy, normal child

Observation of 179 primigravidas during their delivery of an initial breech, and their record during subsequent deliveries as multiparas, seems to warrant the conclusion that the woman's subsequent childbearing should be considered of paramount importance when choosing a method for the delivery of her first child

Conclusions

In the majority of instances successful vaginal delivery of the primigravida presenting a breech at term should be expected of the obstetric specialist

Since breech presentation involves essentially the same fetal risks for the multipara as for the primipara, elective cesarean section seems indicated only in the following instances (a) when the primigravida presenting a breech is at an age unlikely to bear subsequent children, or (b) when there is evidence of disproportion that would be expected to jeopardize her subsequent delivery of any child at term

216 SUMMER STREET

Discussion

Milton G Potter M D, Buffalo—As a theoretical thesis, this paper starts out well but falls apart as it goes along. The advocated policy of management of primiparous breeches is not supported by the results obtained with its use.

In fact there is something wrong with a policy,

in such cases, which carries a corrected fetal mortality of nearly 9 per cent, and that in subsequent trials when the patients were multiparous the results were even worse (ten and five-tenths per cent corrected fetal mortality for breeches in second pregnancy) It also seems unjustifiable to sacrifice a baby's life for no other reason than to avoid a cesarean

I cannot agree with the author's statement that "in the most skilled hands cesarean section increases the immediate maternal mortality tenfold"

In our service we had two deaths in the last 500 cesarean cases and at the Millard Fillmore Hospital there has been no maternal mortility in the last 500 cesarean sections. During the years 1930 through 1946 at this same hospital there were more maternal deaths from vaginal deliveries of breech cases than from cesareans done for this same obstetric complication.

At the Polyclime Hospital in New York the maternal mortality following all causes was 12 per 1,000 and the maternal mortality following cesarean was 13 per 1,000—almost the same, rather than ten times as great. A normal, well woman may have as many babies by cesarean as she wishes. It is not uncommon today for a woman to have five or six cesareans. However, with our improved technic of uterine closure, it is not unusual to follow a cesarean done for placenta previa or an unfavorable breech, by vaginal deliveries with no maternal mortality. The dictum of "once a cesarean always a cesarean" does not hold good today.

No one should advocate routine cesarean sections for all primiparous breeches. As a practical point it would seem feasible to classify all breeches into favorable and unfavorable groups. Put all the factors present under one or the other of these two headings with emphasis on x-ray findings of the head and arms, also the attitude and location of the breech and the condition of the lower uterine segment and if the unfavorable group is topheavy, do a cesarean. Of course, judgment, based on intelligence, experience, and skill, is paramount in making a correct decision.

As Dr Bill, of Cleveland, emphasizes, it is not the bony pelvis, as a rule, which causes the trouble in vaginal deliveries of breeches but the resistant soft parts and the lower uterine segment. He stresses the need of making the way clear for the passage of the baby all the way from the lower uterine segment down through the vaginal outlet. One cannot take for granted that there is complete dilatation of the cervix just because the breech has passed through the external os and is protruding through the vulva. Making sure the cervix is wide open is essential for a successful vaginal delivery, and if there is a reasonable doubt that the head will go through, a cesarean should be done. Studying each case individually is of paramount importance.

Certainly no obstetrician is going to cesareanize any woman whose baby is small and premature regardless of presentation, but if borderline cases present themselves and if the x-ray of the head and arms indicate abnormal positions, cesarean section is in order No obstetric specialist, regardless of his ability, can successfully deliver vaginally a full term normal-sized baby whose head is unmolded and extended, and whose arms are extended lafore delivery is attempted.

The author s two indications for cesarean section are far too limited. Fifty years ago the policy advocated by the author might have been in order

but in my belief today is not tenable.

Henry S Acken, Jr , M D., Brooklyn.-Dra. Randall and Baetz present an interesting approach to the problem of treatment of breech presentation, particularly with regard to the use of cesarean section. I should like to restate their conclusions, i.e., 'elective covarean section seems indicated only (a) when the primigravida presenting a breech is at an age unlikely to bear subsequent children or (b) when there is ovidence of a degree of disproportion that would be expected to jeopardize her delivery of any child at term.

Let us examine these conclusions more closely The elderly primipara exhibiting a breech presentation at term deserves delivery by the means that will most certainly give her a living child. However cesarean section is not always necessary for this, and I would not advocate the invariable use of cesarean even under these circumstances There are instances in which an elderly primipara will have a large pelvis, a small baby a readily dilatable cervix and adequate uterine contractions to accomplish the dilatation. Let us say that the presence of a breech presentation in an elderly primipara widens the indications for cesarean section very markedly but

does not unqualifiedly demand it.

As to the second conclusion, it is hard to believe that Drs. Randall and Baets would limit the use of cesarean section in breech presentation, complicated by disproportion, so stringently as this conclusion would imply The impression one gains from reading this is that unless the polvis under considera tion is so small as to make the delivery of any child a dangerous process, then cesarcan section should not be undertaken without a test of labor actually the test of labor in breech presentation is a test of delivery, because the head comes after the baby instead of before it as in vertex presentation Such a concept disregards a present pregnancy for a possible future one, and it falls to take into conaideration the possible fetal and maternal damage caused by attempting to deliver a breech presentation through an inadequate pelvis. It would seem that this conclusion has been carried to an unwar ranted extreme The knowledge that many of these patients can, after an initial catastrophe, produce a living child in a subsequent pregnancy should have some influence on our thinking and planning in regard to breech presentation. It is quite conceivable that this fact might be of importance in the border line case and that it might here direct us toward an attempt at vaginal delivery But beyond that it should not influence us. We, as obstetricians should be expected to deliver a normal child to a normal mother To do this we must balance many risks one against another and individualize each case. We must make use of the various methods of delivery available to us and apply these methods judiciously to the individual case at hand. I do believe that we have in this paper a further factor to use in reaching a decision, but we do not have in it a rule that should be rigidly enforced

Dr Randall (closing) -I appreciate the discussion and would like to answer the criticisms First, I doubt that external version can be employed to reduce greatly the incidence of breech presentation. I am inclined to believe that Varian is right in concluding that while 20 per cent of bables may be noted to present by the breech during the seventh or eighth month of pregnancy all but 3 per cent of them will spontaneously engage by the vertex, and in the small group that thus persists, efforts at external version are usually un successful.

I do not doubt that the maternal mortality in section can be reduced to the low figure Dr. Potter reports, and I wish to congratulate him upon their record However we all know the comparative figures across the State and nation as a whole, and we believe the higher maternal mortality accompanying section should be avoided, except when there is ample justification for subjecting the mother to that

greater risk.

As for our conclusions if we knew that the breech presentation was likely to persist at term in subsequent pregnancies I believe that the primipara with a breech should be sectioned, for most reports indicate that the fetal risk is almost equally great when multiparas or primiparas are delivered of a breech at term I am afraid I falled to emphasize the main theme of this paper, i.e. realizing that the risk to the baby is greater when we attempt to deliver a breech through a borderline pelvis, since we know the same sized baby could probably be safely delivered through the same pelvis if it were presenting by the vertex. It was reassuring to me at least, to learn that when a primipara presents a breech at term, we can anticipate that when this same patient a subsequent pregnancies reach term, there is only one chance in five that the breech presentation will recur Therefore whenever the mother is young enough to make her subsequent childbearing the matter of paramount importance. we believe we are justified in electing vaginal delivery even when it implies possible loss of the first child, since recurrence of the breech presents tion is unlikely to jeopardize her delivery of subsequent children at term.

AAPS ANNOUNCES 1948 NATIONAL ESSAY CONTEST

In collaboration with State and County medical societies, the Association of American Physicians and Surgeons is conducting its second annual national essay contest for junior and senior highschool students, both public and parochial, on the subject, "Why the Private Practice of Medicine Furnishes This Country with the Finest Medical Care "

The three prize-winning essays from each county somety will compete for state awards and the best three from each state will then be submitted to AAPS for entry in the national contest Six national prizes will be awarded first, \$1,000, second, \$500, third, \$100, fourth, fifth, and sixth, \$25 cach

Medical societies are urged to appoint local essay contest committees, and to enlist the aid of auxiliaries, newspapers, schools and civic groups to gain wide student participation. The committee suggests that locally at least three cash prizes be awarded

The AAPS essay contest committee includes Dr Joseph C Bunten, Cheyenne, Wyoming, chairman, and Drs Herman C Graves, Grand Junction, Colorado, George F Grisinger, Charleston, West Virginia, Herbert T Caraway, Billings, Montana, Walter L Finton, Jackson, Michigan, C W Knudson, Seattle, Washington, and Victor Adams, Raton, New Mexico

Inquiries regarding the contest should be addressed to the chairman, AAPS Essay Contest Committee, Suite 704, 360 North Michigan Avenue, Chicago, 1, Illinois

Essay Contest Rules and Conditions

Junior and semor high-school students from all public and parochial schools located in the United States are eligible to enter the contest-except sons and daughters of physicians

Essays must be limited to 1,500 words

Essays should be written on one side of letter size paper (81/2 by 11) and, if typewritten, double spaced

Contest starts February 1, 1948, and essays must be submitted on or before April 15, 1948, to

County or local medical society or auxiliary sponsoring contest, or

State society or auxiliary sponsoring contest (b) (in the event no county or local group sponsors it), or

Association of American Physicians and Surgeons, 360 North Michigan Avenue, Chicago 1, Illinois, in the event no contest is (c) sponsored by either a county or state society

First three prize winning essays from each county or local medical society must be sent to

(a) The state medical society (if it is sponsoring a state contest) to compete for state awards,

To Association of American Physicians and (b) Surgeons, 360 North Michigan Avenue Chicago 1, Illinois, to compete for national awards (in the event no state contest is held)

First three prize winning essays from each state must be sent to the Association of American Physicians and Surgeons, 360 North Michigan Avenue, Chicago I, Illinois, to compete for national awards

7 Compositions must be original and should be well documented

JUDGING Will be solely on a basis of knowledge and grasp of the subject supported with documentation, and sound, logical conclusions
9 JUDGES

For county contests a physician, an educaand another lay person, all of whom shall have some special knowledge of the **Bubject**

(b) For state contests a physician, an educator and another lay person, all of whom shall have some special knowledge of the subject.

(c) National contest a physician, an educator and another lay person, all of whom shall have some special knowledge of the subject

(Last year's national judges were Dr Warren L Furey, President, Chicago Medical Society, Dr Herman Wells, President, Indiana University, and the Honorable Carl B Rix, President, American Bar Association)

PUERPERAL HEMORRHAGE

Is the Present Mortality Rate Unnecessarily High?

JAMES KNIGHT OUIGLEY, M.D. F.A.C.S. Rochester, New York

(From the Services of the Rochester General Hospital)

URING the past fifteen years the maternal mortality rate in this state has declined to about one third that of 1932 This lessening of the risk of childbearing has been general throughout the United States and has exceeded the fondest hopes of those largely responsible for this improvement public health officials, teachers, and practicing obstetricians, all of whom have given much thought and time to the problem.

The three major causes of maternal deaths are sepsis, toxemia, and hemorrhage. All to a great degree are preventable. The first of these to decline was toxemin eclampsia is so rare today that interns may finish a year of residence in many hospitals without having observed a case This improvement came about as a result of early efforts in maternal welfare which at that time stressed prenatal care. Better teaching and increased hospitalization of the parturient, making possible better care at delivery, combined with the use of chemotherapy and antibiotics, has reduced markedly puerperal sepsis.

To many students of the problem of maternal health it has seemed that the third great cause of maternal deaths, puerperal hemorrhage, has not shown the improvement it should and that the death rate today is susceptible of reduction Puerperal hemorrhage may be classified as due to abruptio placentae or accidental hemorrhage, placenta previa, and postpartum hemorrhage. Deaths from the two causes of antenatal bleeding are not preventable to the same degree as is postpartum hemorrhage but the determining factor in the demise of many cases of placenta previa and in some of abruptio placentae is postpartum hemorrhage.

The improvement in the mortality rate of both abruptio placentae and placenta previa is due to the increased facilities for transfusion and a better understanding of the indications for treatment, such as the performance of cesarean section in placente previa in all but the marginal variety

While the rate for both abruptio placentae and placenta previa has declined, that for postpartum hamorrhage has increased viction of the writer that the number of deaths from hemorrhage, particularly the postpartum vanety can be reduced is the result of observations made during fifteen years analysis of ma-

Presented at the 141st Annual Meeting of the Medical Society at the State of New York, Buffalo, Section on Ob-stetrics and Gyncoology May 7 1947

ternal deaths occurring in a community of over 400,000, which was well-supplied with physicians and had adequate hospital facilities.

A report of the first twelve years of this study was published in 1946.1 This included 232 deaths and the over-all picture was encouraging, for it showed a general decline from 4.5 per 1,000 in 1933 to 0 6 per 1,000 in 1944. For purposes of comparison this survey was divided into two periods, the first of five years at the time of an interim report, and the second of seven years. There were 28 deaths ascribed to hemorrhage in the twelve years. These did not include 15 deaths from ectopic pregnancy, five from ruptured uterus, and four from inversion of the uterus, in all of which categories, hemorrhage if not the sole factor, was at least the chief contributory cause. All the deaths from abruptio placentae and four of the six deaths from placenta previa occurred during the first five years, showing a substantial reduction in deaths from antenatal hemorrhage Fatalities from postpartum hemorrhage, however, increased from 5.2 per cent of the total deaths in 1933 to 1937 to 8.1 per cent in 1938 to 1944

While the issue is not perfectly clear, due to overlapping or multiple causes of death in the same case, it is undoubtedly true that mortality from puerperal hemorrhage, particularly the postpartum variety, has not shown any improvement in five or more years. One might conclude that we had reached an irreducible minimum were it not for the fact that close examination of the records of many of these deaths shows that the treatment accorded these patients in many in stances was far from ideal or from what should be expected today. The following abstracts of 3 case histories are illustrative of this statement

Case 1 -A 22-year-old para II delivered spontane-Cass 1—A 23-year-out part 11 ucuverous spinisture outs! The placents was expressed ten minutes later and was followed by considerable bleeding. The patient went into shock one hour later Vaginat tamponade was done, glucose and saline were given intravenously, nine hours later there was bleeding than the realizer that multi-star most 150 and through the packing the pulse rate rose to 150, and she died six hours later or seventeen hours after delivery There was no typing and no transfusion.
The vapina was packed but the uterus was not
Case S.—A primipars aged 23 after a long labor
was delivered with some difficulty by middorceps

operation. As there was no scrubbod assistant, the resuscitation of the baby was done by the physician. The fundus was not watched. Five minutes after the birth of the baby the lower pole of the

Conclusion

There is agreement among those who have studied carefully many fatalities from puerperal hemorrhage that a large percentage of these might have been prevented had the attendant used the knowledge and facilities available today in hospital deliveries, and had he been alert and prompt in meeting this serious emergency. The indication for controlling hemorrhage and replacing blood loss should be a measured loss of blood and not estimated loss or signs and symptoms of hemorrhage, for these lag behind the actual blood loss and treatment after the onset of shock may be too late to be lifesaving

Rh factor determination and blood typing should be a routine procedure and blood banks should be available

SCIENTIFIC EXHIBITS 1948 ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to Chairman of Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss 505 State Tower Building Syracuse 2, New York

The Annual Meeting will be held May 17 to 21, 1948, at the Hotel Pennsylvania in New York City

No Applications can be considered after January 15, 1948

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation.

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P ANDERTON, M D, Secretary

VAGINAL HYSTERECTOMY

OLIVER N EASTMAN, M.D., FACS Burlington, Vermont

(From the University of Vermont College of Medicine)

BURLINGTON, Vermont, a comparatively small medical center in a rural state with few transients affords a rather unique opportu nity to study the merits of an operative procedure for the correction of obstatue complications and especially is this so of pathologic damages to the polvic structures. Women of preceding generations in Vermont received little or no pre- or postobstetric care Lacerations at childbirth were neglected too often because of inadequate facilities for surgical repair in the homes where 90 per cent of these women bore their bables. Two or three interrupted sutures of silkworm gut for second or third degree lacerations and no sutures for internal tears was the rule. The younger generation of gynecologists can scarcely appreciate the difficulty encountered following a forceps delivery of an obese patient in the middle of a featherbed, with the husband or a kind neighbor holding a lantern with the rays reflected as much in the physician's eyes as on the patient s peri Household duties requiring lifting and straining soon after delivery were added factors favorable to the commonly acquired "falling of the womb' Routine aid for this distressing condition called for palliative treatment with pesse nes and gadgets, hard and soft, large and small round and square, in fact, anything from an apple to a doorknob to afford relief

Retroversion of the uterus with procidentia of varying degrees, associated with cystocele and rectocele, comprises a large percentage of the cases in which vaginal hysterectomy offers a fav orable operative solution for these afflicted women. True, we have at our command other corrective surgical means which give excellent results in selected cases but considering all points, I believe no other operative procedure can offer so many favorable factors as does the vaginal hysterectomy With this thought in mind, we have endeavored to correct several of the more undesirable features of this operation and at this time submit a preliminary review of 1,000 personally operated cases in which the uterus has been removed vaginally Several years more will be required in this study to determine a number of variable factors. The operation which we now employ, and believe to be a good operation, is quite different from the one we did fifteen years At this time we are scarcely able to evalu ate the several procedures which we have used

With poor risk individuals-patients with car diac insufficiency, diabetics the obese the aged the patients with intestinal adhesion complica tions in previous abdominal operations—the va ginal approach for a hysterectomy is favored. Local anesthesia affords a minimum risk in these cases and is used routinely in the aged versely a history of previous pelvic inflammatory disease endometriosis, or any condition causing limited mobility of the uterus, with shortening of the supporting ligaments and fascia, malignancy of the cervix, adnexal pathology of any nature, or cases in which abdominal exploration is advisable. are contraindications for vaginal hysterectomy An open mind to operate whichever way is best for the patient is to be desired, and a competent gynecologist should be able to select the prefer able approach, always bearing in mind that a hysterectomy started vaginally can be completed readily from above, should conditions be found to make this expedient. Such has happened in a few of our cases. In one instance the left oversan vessels escaped from a faulty clamp and necessi tated an abdominal incision for ligation In another case a pedunculated fibroma became separated from the utenne fundus, requiring an abdominal incision to extract the tumor from coils of small intestine In approximately 25 per cent of cases the vaginal approach serves best In 25 per cent of cases this is equally true of an incusion through the ventral wall while in the remaining 50 per cent, it will make little or no difference. The choice remains for the surgeon to decide which is more convenient for him to do In our series of cases, we find we did 1,000 vaginal hysterectomies, while we did 796 hysterectomies

in determining whether or not satisfactory results are more frequently met with the present procedure than with the ones used earlier. are we quite sure which type of case lends itself best to this or that type of correction feel, however, that on general principles for the patient's best interests, certain cases can best be operated vaginally, while other cases require abdominal approach for best results Procidentia of the uterus with evstocele and rectocele is by far the chief indication for vaginal hysterectomy Metrorrhagia, near or postmenopausal, chronic cervicitis, cervical and uterine polyp fibrosis with hyperplasis and stricture of the cervix are frequently met indications. Marked clongation of the cervix and considerable procedentia following a ventral fixation of the fundus uteri is not an unumini indication

Presented by invitation at the 141st Annual Meeting of the Medical Sectory of the State of New York, Buffalo Section on Obstetries and Gynecology May 8, 1947

through an abdominal incision over the same penod

At this time it is pertinent to mention that a considerable number of vaginal operations have been performed for the removal of a cervical stump and a repair of a cystocele and rectocele where a previous operation had removed the upper part of the uterus only These cases are not counted in our study as vaginal hysterectomies I would also stress that in doing abdominal hysterectomies for several years we have left only an occasional cervix One readily appreciates why this is important after reviewing the literature with the reported frequency of stump cancer in approximately 6 per cent of well-studied cases in our leading gynecologic clinics The frequency of cervicitis, chronic infestation with trichomonas, and cystic degeneration of the cervix, play a lesser role, but are, nevertheless, important

It would be logical to assume that in vaginal hysterectomy and repair we more nearly establish normal relations of remaining pelvic tissues than in any other corrective procedure with the exception of the Spaulding-Richardson and the Incidentally, following this LaFort technic latter procedure I have encountered a relatively high percentage of recurrence of the disability for which the operation was performed, and rarely does it seem advisable to select this type of operation for procidentia The Watkins. Manchester, Fothergill, and interposition types of correcting procidentia, all seem to be based on transplanting the fundus uten to an abnormal position beneath the bladder base or anterior wall. thereby reducing the existing prolapse which constitutes an operation not aimed at re-establishing the normal relation of the tissues involved before the procidentia developed Physiologic functions in the structures involved would seem to be markedly changed I am convinced that patients who have undergone a vaginal hysterectomy are decidedly more comfortable than are those on whom I have performed one of these other operations Controversial opinion—right or wrong—the uterus still remains, correcting to a degree the prolapse of the bladder, but still presenting a fertile field for pathologic changes Restoration of cardinal fascia and uterine ligaments to near their normal level and the removal of the uterus, in which there is so frequently found pathologic changes not recognized in situ, argue favorably for total uterme removal Evaluation of existing dysfunction is highly important and should be taken into consideration in any corrective procedure In considering vaginal hysterectomy one must be conversant with the normal and be able to appreciate the necessary correction before starting the operation gree of prolapse of the uterus, of the bladder, the urethra, and the holding propensity of supporting structures, should be taken into consideration and borne in mind throughout the entire operation

Three important steps seem worth while stress-First, delivery of the fundus uten through a cul-de-sac opening permits accessibility to clamping the lateral uterine supporting structures Morcellation of the uterine body can be accomplished readily should this be required to lessen the size of the uterus in effecting its delivery Especially is this so in the presence of a large leiomyomatous uterus

Second, by inserting two fingers of the left hand behind the uterine fundus, the bladder is elevated readily so there should be no danger of incising the bladder wall when the peritoneal cavity is opened anteriorly This accident does take place in the classic vaginal hysterectomy even in the hands of competent and excellent surgeons. as several have attested I have vet to see this accident happen where the uterus is removed posteriorly

Third, a normally deep vagina requires severing the mucous membrane well down on the cervix. The approximation of the prevential columns of tissue which have thinned and separated laterally. permitting the bladder to herniate downward, leaves a long anterior vaginal wall A slightly lax anterior vaginal wall is preferable to a tense anterior wall which may give the patient discomfort when the bladder is distended Wide lateral dissection of the vaginal mucous membrane provides good bladder support, but too frequently shortens the anterior vaginal wall We prefer to maintain anterior wall depth by trussing the lower margin of the vesicocervical tissues to a high position by suturing to a central stump previously formed by the approximation of the uterine ends of the infundibulopelvic ligaments A 10 to 12 cm depth with an introitus readily admitting two fingers is desirable

Technic of Operation

With the bladder empty and the vaginal mucous membrane prepared by painting with phemerol or merthiolate solution, the cervix is grasped with 2 volsellum forceps closing the cervical A circular incision is carried around the cervix, attached cervical tissues are separated with seissor dissection and gauze over the thumb, pushing the mucous membrane upward, and exposing the lateral cervical tissues which are sutured on either side with chromic Number 1 catgut cervical branch of the uterine artery is severed below and parallel to the suture, thereby preventing its slipping off the pedicle The cervical attachments of the sacrocervical fascia are severed, permitting the uterine vessels to come into the operative field as the uterus descends are ligated on either side with a suture of chronic

Number 1 These vessels are severed parallel to the suture which is cut to permit the vessels to retract to a higher level. The oul-de-sac is opened and the fundus of the uterus delivered through this opening. The bladder is now elevated by inserting two fingers of the left hand while scissors held in the right hand open into the anterior space. Curved clamps from below and above, their points in apposition, clamp the structures adjacent to the uterme body on either side Sev ening of these structures permits the delivery of the uterus. Each pedicle is sutured with Number 1 chromic catgut before removal of the clamps. The sutures are left long to permit approximation of the stumps after peritoneal closure. Adnexal examination is done at this time and pathologic tissues removed. Should an examination of the cavity of the uterus reveal carcinoma, both tubes and ovanes are excised at this time If either or both fallopian tubes give evidence of inflammatory changes, removal is advisable. The peritoneal cavity is now closed with a running suture of fine chromic catgut. Both pedicles of the infundibulopelvio ligaments remain outside the closed peritoneel cavity and are now approximated by ligating the sutures previously left long The cystocele is next repaired by separating laterally and removing the redundant mucosa, ex posing the denser structures which are to be

approximated in the cystocele repair A suture of chromic catcut is now passed through the distal end of the fascia on the left side which was previously separated from the cervix, through into the central stump formed by the union of the infundibulopelvic ligaments and out through to the corresponding fascia on the right side. This suture remains lax at this time, thereby permitting a repair of the cystocele at a relatively low level. The cystocele is repaired with two or more layers of fine chromic catgut, approximating the tissues which previously had been damaged, permitting a cystocele to form. The connective tissue beneath the urethra is approximated, usually with a continuous suture of chromic 00 In joining these structures, interrupted chromic catgut sutures were used in the earlier operations, but seemed to bave no special advantage over a continuous su ture which is not drawn tight and the absence of buried knots favors smooth healing of the mucous membrane The two top autures, attached to the central stump previously mentioned are now threaded on a round needle and passed from within outward on opposite sides, catching supporting fascia, then passed through the mucous membrane one on either aide. Two more sutures from the central stump are used at a lower level while the remaining two are passed through the sacrocervical tissues and mucous membrane which were previously separated from the cervix.

The sutures are ligated in reverse order of their insertion

This method of suturing elevates the various vault to the highest position possible and joins the cardinal ligaments from side to side which were originally separated only by the cervix. operation is completed by repair of the rectocele. A central strip of mucous membrane is removed extending from the introitus to the cul-deopening, along the posterior vaginal The width of this strip depends upon the size of the rectocele to be repaired. The perirec tal fascia is now approximated with sutures of 00 chromic catgut, the levator fascia is approximated with interrupted chromic catcut sutures Number Approximation of the subcutaneous fascia in the penneal body is accomplished by a running auture through the fascia and returning upward as a subcutaneous suture A light pack of sterile gauge in the vagina and a retention catheter, to remain from twelve to forty-eight hours, com pletes the operation.

Statistics

Much appreciation is deserved by Dr Barbara Beardslee for the painstaking effort in reviewing this series of which only a preliminary report is submitted by the author The age groups and details of morbidity and mortality, are too voluminous to be incorporated in this paper

IS ANAL FISTULA A NECESSARY SEQUEL TO PERIANAL ABSCESS?

EMIL GRANET, M.D., New York City

CURRENTIA, hospital beds are universally at a premium and operating room facilities are soverely overtaxed. Any measure directed toward alleviating this deplorable condition is deserving of our earnest consideration. The advantage of obtaining a cure following the primary surgical treatment of a patient with perinant suppuration is obvious. Too often a residual fistula is the expected result entailing one or more hospital readmissions for further operation. Jackman reported recently that of 500 patients seen at the Mayo Clinic with anal fistula, 43 per cent, or nearly one half, had undergone from one to fourteen operations for this condition.

It is my intention to show that fistulas-in-ano often can be prevented if two surgical axioms are observed (1) that the optimum time for drainage of perlanal suppuration is at the earliest mement when this process is suspected by symptoms and physical signs, and (2) that in most instances it is possible and expedient to treat acute and chrone perlanal abscess in one surgical procedure, so that the infectious lesion is drained or excised completely, that is, from the primary source of infection in the anus to the remote perlanal or schlorectal abscess. Henceforth in this report the term "perlanal" will include ischlorectal and other infrallevator abscesses.

Contemporary opinions as to the management of penanal suppuration, especially in regard to those phases of the problem just stated are divergent or indecisive

Buie favors delayed incision and, in general, allows an abecess to approach the point of rupture before interfering 2 Smith and Vickers express identical views. 2.4 On the other hand, many of us agree with Allingham who, sixty five years ago stated "It is certainly less damaging to cut into an inflamed swelling near the anus without find ing pus than to let a day pass over after suppuration has commenced, the longer the abscess is left unopened the greater the danger of the formation of lateral sinuses." That this edict has been followed at St Mark's Hospital for decades is indicated by the current opinion of Gabriel who states, "Every anorectal abscess should be incised at the earliest possible moment It is not desirable to procrastinate and apply palliative treatment until fluctuation has oc curred, for abscesses in this region never clear up spontaneously " Horseshoe, perirectal, supralevator, and "water spout' fistulas are the fre-

ţ

ţ

quent end results of such procrastnation on the part of the patient, the doctor, or both Perland suppuration must be treated as a surgical emergency In those cases in which hospitalization is necessarily delayed, a simple stab incision into the abscess, performed at the home, office, or clinic, will afford an external exit for pus under pressure thereby preventing circumferential spread

That "stem to stern" drainage of anorectal abscesses be utilized when possible constitutes my second premise Here again current opinions regarding this procedure are divergent or inde-Miller states "If an opening into the anal canal be discovered no attempt should, as a rule, be made to lay this open at the time of the primary operation. If a fistula results, it should be dealt with by operation a few weeks later "7 Buie, Manheim and Bacon are guardedly con servative 2.2.9 They extend drainage through the primary internal opening only in special instances when the abscess is superficial, localized, and the internal opening easily located However, in a recent article Bacon16 has crystallised his opinion and states that he attempts operation for abscess in one sitting "We have performed this maneuver in selected cases in several hundred in stances and seldom have encountered a recur rence," said Bacon.

In naval personnel hospitalized for perianal abscesses my utilisation of the one-stage operation resulted in wounds that healed without fistulas, thereby minimizing hospital morbidity and permitting early return to duty

Pathologic Physiology

Successful therapy in medicine is dependent, primarily, on a lucal understanding of the pathologic physiology resulting in a specific lesion. It is probable that most perianal abscesses originate in the anus Several anatomic structures, most important of which are the anal crypts, ducts, and intramusoular glands, are involved The latter were first described in 1880 by Harmann and Desfosses who pointed out their etiologic importance in producing perianal fistulas

In 1914 Franklin P Johnson published comprehensive studies on the embryology of the rectum in which he emphasized the development of the intramuscular glands. This early, complete, and detailed description is of great significance to the problem of perianal suppuration Johnson described gland-like, simple or branched tubules lying completely in the submucosa known as the intramuscular glands. There are

Presented at the meeting of the New York Proctologie Society April 10 1947

seldom more than six or eight of these. The main ducts of the glands penetrate the internal sphincter muscle to terminate blindly in the intramuscular connective tissue.

Johnson's description of the anal ducts and intramuscular glands was confirmed and subsequently elaborated on by Harris, Lockhart-Mummery, Gordon-Watson, Pope, Tucker and Hellwig, and, currently, by Kratzer and Dockerty Harris found that occasionally these glands after penetrating the internal sphinoter spread to the superficial surface of the levator am and so into the ischiorectal fossae, or to the deep surface of the levator and so to the supralevator space 12 It is obvious, as Lockhart-Mummery pointed out, that "these glands communicating as they do with the bowel lumen, afford a path for infective organisms to reach the connective tissue of the ischiorectal fossa and so set up an abscess in this region "13

Gordon-Watson and Dodd demonstrated that infection can take place primarily in the gland when there is no direct communication with the anal canal ¹⁴ Evidence of primary gland infection is offered in serial sections of fistulous tracts examined after excision by these authors Portions of the intramuscular gland substance inhed by transitional epithelium are clearly shown to be involved in a localized abscess process. In these instances the ducts communicating with the anal canal may have been obliterated during development and/or the anal orifices of the ducts become blocked by the congestion of the mucosa or submucosa. Kratzer and Dockerty in a current report confirm this opinion ¹⁵

That the crypt opening into the anus sometimes is sealed is common experience. Even in operation for fistula-in-ano, search for the internal anal opening by probe occasionally fails and it can be demonstrated only by the injection of dye under pressure through the external opening Failure to cure a fistula usually is attributed to the fact that the true internal opening has been unintentionally spared In my experience search for the internal anal opening of a crypt, tubule, or intramuscular gland by means of a probe from the anal side was seldom successful in the presence of an acute abscess Mucosal edema, induration, and inflammatory obliteration of the crypt were probable factors contributing to the failure of this maneuver Obviously in an acute abscess the injection of dye is unfeasible most of our acute abscesses, however, the anal source of infection was found by retrograde probe exploration following incision of the abscess

Fistula-in-ano commonly is regarded as the contracted, fibrotic end result of an externally drained perianal abscess. As shown, the source of such an abscess usually is found in a crypt,

tubule, or intramuscular gland. If this focal source of infection in the anus is removed at the same time that the abscess is drained, it is logical to assume that a fistula-in-ano cannot result. Of 48 consecutive patients with infralevator perianal abscess recently treated, this one-stage "stem to stern" operation proved feasible in 40".

Method of Treatment

One hundred and twelve consecutive cases of perianal inflammatory disease were treated surgically at the US Naval Hospital, St Albans, New York, in a recent eighteen-month period Of these, 60 were fistulas-in-ano. The remaining 52 were patients with perianal abscesses, 36 acute and the remaining 16, subacute or chronic (Table 1)

TABLE 1.--TOTAL PERIANAL ABSCESSES

Recurrent abscess with aupralevator sinus	3		8
Acute supralevator ab-	1		1
Total	52	45	7

The term, chronic abscess, as used in this report requires elucidation. Patients so classified developed an acute perianal abscess at sea or at a remote naval station. Spontaneous rupture of the abscess had occurred some days or weeks before the patient arrived at our hospital with an indurated, inadequately draining wound. In some, the medical officer or corpsman had incised the abscess, thereby relieving pain and limiting circumferential spread. Definitive treatment of these subacute or chronic lesions simulated that of our acute abscesses except for the first maneuver, the exploratory stab

Caudal anesthesia combined with second sacral block anesthesia was used in 32, intravenous sodium pentothal in 16, and spinal anesthesia in 4 of 52 cases of perianal abscess. The prone "jackknife" position with buttocks retracted by adhesive straps was found to be convenient and practical

The t ment of an acute, right, posterior ischior, abscess is as follows. The adequate of the explored digitally and by hooked prob in an attempt to find the anal source of in-

fection If not immediately successful, the search for the primary sinus is abandoned as, in my opinion, prolonged probing in these cases is meddlesome and of little value in acute abscess

With a scalpel an exploratory stab incision is directed cephalad and medially toward the center of the indurated abscess. Following the evacuation of pus the stab incision is enlarged in a direction parallel to the external aphineter muscles so that an exploratory finger can be in serted. Finger investigation determines the extent of the abscess cavity and breaks down residual fascial septa and secondary abscess pockets. With blunt seasors introduced over the exploratory finger, the wound is enlarged to the anterior and then to the posterior limits of the abscess cavit.

Anteroposterior perianal incisions favor drain age for two reasons. One, the fibro-elastic septal insertions of the longitudinal muscle of the rectum which course radially or spoke-like from the anus are cut across, thereby draining individual fascial spaces. The "fish mouth" or "hockey stick" incision serves the same purpose in draining an anterior closed space infection of the finger. Two, by its approximation to the sphincter muscles the medial wall of the abscess cavity is drawn inward and away from the fixed lateral wall. The wound edges are separated thereby, so favoring drainage. In contrast radial perianal in cisions tend to close when the sphincter contracts.

A blunt, curved hemostat is utilized as a probe in seeking the tract leading from the abscess cavity to the primary source of infection in the anus This tract is found easily in most cases and the point of the hemostat can be palpated just beneath the anal mucoderm A probe pointed grooved director is substituted for the hemostat and an internal opening is sought patients the probe readily emerged in a posterior crypt. In many others despite careful search the probe point remained in the submucosa with only the mucosa or anoderm separating the probe point from the palpating index finger probable that in these cases the primary source of the abscess originated in an anal duct or an the anal canal was provented by the sealing of the crypt or distal portion of the duct through developmental or inflammatory changes as sug gested by Gordon Watson

It is obvious that one cannot retreat leaving a virulently infected submucous nus tract. I elect, therefore, to push the propertitiough the mucosa while held at right angles it it pourse of the fibers of the external sphincter, it. Hes A fistulous tract thus is established from the internal opening in the anus to the external opening in the anus to the external opening in the second of the second opening in the second of the second opening in the second opening in the second of the second opening in t

ing in the drained abecess. The tissue and sphincter muscle overlying the grooved director is incised by scalpel directed along the groove The abscess is drained thereby from the "stem" in the anus to the "stern" in the abscess cavity The skin and subcutaneous tissue overlying the abscess are removed and the wound edges are cut well back to saucenze the wound adequately Overhanging skin edges are not tolerated incised tract into the anus is dealt with similarly so that, following excision of the edges, the wound should resemble a shallow trough After hemostasis has been assured, moistened iodoform gauze is packed into the abscess cavity and secured by adequate superficial dressing separate sliver of gauge is laid in the anal wound to be extruded with the first defecation pack is removed from the abscess on the fourth postoperative day at which time the necrotic abscess base has sloughed off to a large extent.

Results

In 40 of 43 patients, treated in the manner described, the lesion was healed by complete epithelization in four to eight weeks. In 3 patients a secondary internal opening was found at or above the anorectal ring. In these a two-stage 'scton' operation was performed. In 5 patients with typical infralevator abscesses a sinus tract leading toward the anus could not be found. These patients were treated by saucerization of the abscess and healed uneventfully.

There were 4 patients with a perianal abscess originating in a chronic anal fissure. These were treated first by drainage and saucerization of the abscess and then by excision and definitive treatment of the anal ulcer.

Two patients had perianal abscesses from which a sinus tract led posteriorly to the source of in fection in an inactive pilonidal cyst. Another patient in this group had bilateral abscesses, each of which was connected to a pilonidal dimple, the common source of origin of the abscesses

Three patients with chronic fistulas had recurrent perianal abscesses. At exploration, sinus tracts were found which led cephalad into the supralevator space

Only one acute supralevator abscess was en countered This occurred in a Navy diver who was operated on five days after the onset of symptoms. The relative infrequency of supra levator abscess is commented on by Gabriel who found only 4 (3 per cent) in 132 consecutive ad missions to St. Mark's Hospital for the treatment of anorectal abscess 6

Summary

1 In most instances an anal fistula results when a perianal abscess has been incompletely

Surg Gynes

This sequel usually drained by local incision can be prevented if the abscess is afforded early dramage, not only locally, but at the source of infection in the anus

Contemporary literature regarding these points is quoted to show that even authoritative opinion on the management of this problem is divergent and indecisive

Because of its importance to the problem, the development of the generally accepted concept that perianal suppuration has its source in anal crypts, ducts, or intramuscular glands is reviewed in detail Evidence that a source of perianal infection can exist in the intramuscular glands or anal ducts without a patent communi-

cating tract to the anus is presented For this reason sometimes it is impossible to demonstrate an internal sinus opening in performing fistulectomy In such instances failure to find and remove the infectious source in the anal duct or intramuscular gland results in persistence of the lesion Inasmuch as a perianal abscess is the precursor of a fistula, it is essential that concurrent with surgical drainage of the abscess, the associate infectious source in an anal crypt. duct, or intramuscular gland be sought for and excised If this is accomplished, a fistula cannot result

The technic of "stem to stern" drainage in the surgical treatment of perianal abscess is described This one-stage operation proved feasible and resulted in uncomplicated healing in 40 (93 per cent) of 43 patients with infralevator This experience demonstrates that anal fistulas probably can be prevented in most instances, if acute perianal abscesses are drained early and completely from "stem to stern"

ANNOUNCE BOARD EXAMINATIONS

The American Board of Obstetrics and Gynecology, Inc, has announced that the next written examination (Part I) for all candidates will be held in various cities of the United States and Canada on Friday, February 6, 1948 at 2 00 P M Candidates who successfully complete the Part I examination proceed automatically to the Part II examination held later in the year

A number of changes in Board regulations and requirements were put into effect at the last annual meeting of the Board held in Pittsburgh, Pennsylvania, from June 1 to June 7, 1947 Among these is the new ruling that the Board does not subscribe

to any hospital or medical school rule that certification is to be required for medical appointments in ranks lower than Chief or Senior Staff of hospitals, or Associate Professorship in Schools of Medicine, for the obvious reason that such appointments constitute desirable specialist training. At this meeting the Board also ruled that credit for graduate courses in the basic sciences which involve laboratory and didactic teaching rather than clinical experience or opportunities will be given credit for the time spent up to a maximum period of not more than six months regardless of the duration of the course

THE PRACTICE OF MIDWIVES IN NEW YORK CITY

HELEN M WALLACE, M.D., CURTIS L. MENDELSON, M.D. LEONA BAUMGARTNER, M.D. and RUTH ROTHMAYER, R.N., New York City

(From the Bureau of Child Hygiene New York City Department of Health)

THE practice of midwifery has changed I markedly since the turn of the century Prior to 1907 midwives were required simply to appear at the office of Registrar of Records to register their signature and present certificates of character and experience from two physicians No supervision was maintained over their practice In 1907 the New York State Legislature passed an act which tested the regulation of practice of midwifery in the Board of Health In 1909 this supervision was placed in the Bureau of Child Hygiene and Section 196 of the Sanitary Code was enacted In 1913 a Midwif ery Division was created The same year the Bellevue School for Midwives was opened and continued to function until 1936

In November 1933 the New York Academy of Medicine published a study of the maternal mortality in New York City from 1930 to 1932 Releases to the press from this report included statistics purportedly indicating that delivery in the home was safer than delivery in the hospital and that the midwife was responsible for only a small percentage of maternal deaths as compared to the physician.1 The better results of home deliveries were attributed to 'spontaneous deliveries and uncontaminated surroundings with proper attendants Operative deliveries anal gesin and anesthesia were described as signifi cant factors in raising maternal mortality The report stated that "it would appear that domiciliary obstetrical practice must undergo further con aderation and probable re-evaluation" and contrary to the generally accepted opinion the midwife is an acceptable attendant for properly relected cases of labor and delivery " Yet elsewhere in the chapter on midwifery one finds the following paradoucal paragraph 'A large num ber of the practicing midwives in New York City are foreign-born women who trained in the coun try of their birth and came to this country before the present laws regarding licensure were put into effect. There is no provision in the law for examination or refresher courses. It is a little hard to believe that a woman of sixty wholly illiterate, trained forty years ago and having no further study since that time can be a safe attendant for a woman during her pregnancy and

In March, 1934, the New York Obstetrical Society appointed a committee to review this report of the Academy of Medicine, and the following month a critical analysis was presented The Obstetrical Society pointed out that the question of home versus hospital delivery resolved itself into differentiation of adequate and inadequate hospitals, and that delivery in a well organized and well-equipped hospital was defi nitely safer than home delivery 2. The relatively high number of hospital fatalities referred to in the Academy report were explained by the bad cases which had been started in the home Obstetrical Society also pointed out that, although it was an almost impossible task to ascribe responsibility of maternal deaths, any figures used to compare the results of midwives and physicians should have been based on the percentage of deliveries each group performed rather than on the percentage of total preventable deaths since the midwife performed only 8 per cent of the total deliveries

When the former method of comparison was used there was actually a higher percentage of preventability in the deaths among women at tended by midwives than among the cases in general or among those delivered at home by a The Committee further stated that physician "operative deliveries in skilled hands were necessary merciful and lifesaving' and that they constituted one of the great advances of modern obstetrics tending to lower maternal mortality rather than increase it. Anesthesia and anal gests were described as not only humane but tending to prevent unnecessary and too early interference with the natural processes of labor and per se did not add to the maternal or fetal death rates nor to operative interference. The Committee concluded that the practice of obstetrics would never be elevated to the position it rightly deserves so long as the midwife was per mitted to practice "There is need of apprecia tion of the inadequacy of any system which in troduces incompetency in competition with scien-The midwives are a menace to tific knowledge the health of the women under their supervision and the care of the expectant mother is too important and technical to be entrusted to attend ants without complete and adequate training

delivery 1 et, such women are practicing mid wifery in New York City"

Presented at a meeting of the Section of Obstatrics and 27 secology of the New York Academy of Medicine January

In 1937 the Sanitary Code was revised requiring annual relicensure of all midwives Subsequent revision in 1944 prohibited the midwife from delivering abnormal cases and required her

to deliver at least one case a year to qualify for relicensure The Code also provided for referral of all cases to a physician or clinic for prenatal care and blood test, and notification of the Health Department upon registration of new cases Further provisions were made for summoning the

Further provisions were made for summoning the aid of a physician

The present supervision of midwifery may be outlined as follows. Every three months a field nurse from the Health Department visits the midwife in her home to inspect her equipment, records, and premises. The records include a quarterly report of all cases with regard to antepartum care and blood test, type of delivery, postpartum examination, and complications. These quarterly reports are also reviewed at the

District Health Center and at the Bureau of Child Hygiene A field nurse sees all midwives' patients antepartum and postpartum. In the event of any irregularities the midwife is summoned, instructed, and warned

The midwives have served a group of women in whom custom and superstition prevented care by a physician. As these customs and superstitions changed with education of the public and expansion of hospital facilities, the need for midwives' services has decreased. Table 1 presents a picture of the decreasing role which the midwife has played, and shows that the midwives now perform less than half of one per cent.

TABLE 1—Number of Midwives Number of Midwife Deliveries and Percentage of Total Deliveries in New York City—1909-1945

of all deliveries in New York City

Year	Number of Midwives	Number of Midwife Deliveries	Percentage of Total Deliveries
1909	3 181	49 616	40 3
1919	1 695	41 876	32 1
1929	1 229	12 505	10 0
1939	273	1 600	1 5
1940	233	1 311	1 2
1941	193	999	0 9
1942	201	1 147	09
1943	156	750	0 6
1944	128	547	0 4
1945	116	492	0 4

A detailed analysis was made of the 750 deliveries in 1943 and of the 492 deliveries in 1945 performed by midwives. Despite the fact that the Sanitary Code was amended in 1944 and a refresher course held the same year, there was no change in the quality of maternity care in this two-year interval. Analysis of the 492 deliveries performed by 116 midwives in 1945 follows. The data to be presented were obtained from personal interviews with the midwives and from their quarterly reports. It should be

pointed out that the latter were often incomplete, inaccurate, and, in some instances, deliberately

The age range of the midwives is shown in Table 2

TABLE 2 -Age of MIDWIVES

TABLE 2 -AGE OF MIDWINES		
Age	Number of

The number of deliveries ranges from 0 to 37 per mulwife Approximately 90 per cent of the 116 mulwices performed five or less deliveries in 1045. If one assumes that proficiency requires constant practice it is obvious that at least 90 per cent of these midwives did not have the opportunity to remain proficient in obstetrics. The data also indicate that these midwives cannot be dependent upon their practice for a livelihood.

Table 8 shows the time that antepartum care was begun and the time the serologic test was per formed

TABLL 8.—TEIMESTER OF PRECNANCY ANTEPARTUM CARE WAS BEGUN AND WASSERMANN WAS TAKEN

	Number of Patients Beginning Ante-	Number of Patients Having Blood

		8	
1	8	8	Baby macerated. Physician called during labor who fetal heart lost." Midwift had 6 deliveries in 1945.
2	8	None	Fetal beart lost during labor Cord three times around neck Physician not called Midwife had 9 deliveries in 1945.
3	8	8	Physician had told midwif- case was abnormal but mid wif continued care. Fi- nally sent to bospital in labor- with prolapsed cord and toxerola. Same midwife as Case 2.
4	None	None	No physician called Midwife had three deliveries in 1945
5	7	8	Patient had had previous still birth. Physician called after delivery blidwife had 22 deliveries in 1945.
6	None	7	No physician called. Midwife had 21 deliveries in 1945.
7	None	Yon•	Physician called when breech presentation recognized late in labor Midwife had 4 de- liveries in 1045.
8	4	None	Physician not called. Midwife had 17 deliveries in 1945.

Table 10 presents the data on stillburths for 1945

There were eight known stillbirths giving a stillbirth rate of 16 3 per 1,000 deliveries. Whereas this may not appear high at first glance, it must be remembered that neonatal deaths are not included and these account for as much as 50 per cent of fetal mortality. None of the cases had adequate care. Antepartum care and blood tests were performed late or omitted.

There were no maternal deaths in the 492 cases which could be attributed to the midwife. The Sanitary Code stipulates that the midwife shall not handle abnormal cases, yet 2 known cases of tovemia, both resulting in eclampsia, and 5 known cases of breech presentation were managed by the midwives. This can be explained only by inability of the midwives to recognize abnormal cases or refusal to abide by the

Medical assistance was called for in only 31 out of the 492 cases and most of the time too late, i.e., after hemorrhage, laceration, retained placenta, or loss of fetal heart. In several instances the midwife had not recorded this information or had deliberately falsified it. One midwife's patient was brought into a hospital, after attempted abortion, with a loop of bowel protruding from the vagina

Discussion

The data presented reveal that the midwife now performs less than 0 5 per cent of deliveries in New York City Half of the midwives received their training twenty-five or more years ago good number are illiterate and are too old to attend any regular classes, so that it is practically impossible to undertake any educational program to acquaint them with modern standards of maternity care Ninety per cent of the midwives performed five or less deliveries in 1945 It is obvious that it would be difficult for them to retain their skill in obstetrics with such a small practice, and it is equally obvious that these women cannot be dependent upon their lawful practice for a livelihood The legal history presented sheds light on their extracurricular activi-

This study clearly indicates that the majority of patients delivered by midwives in New York City received maternity care which may be classed as inadequate. Antepartum care and blood tests frequently are omitted or performed late in pregnancy. Most patients have no postpartum examination. Furthermore, the midwives delivered cases prohibited by law because of abnormalities such as toxemia, abnormal presentation, and positive serology, and not infrequently the records were falsified deliberately.

Provisions for summoning the aid of a physician were ignored, or such aid was called for too late Analysis of the stillbirths reveals that none of the cases received adequate care. Whereas the stillbirth rate is not remarkably high, neonatal deaths are not included, and as previously stated these neonatal deaths account for as much as 50 per cent of fetal mortality.

Interviews with 116 midwives resulted in 56 accepting retirement certificates. A detailed review of the records of the remaining 60 was presented to the Midwifery Board, and the Board of Health saw fit to deny renewal of midwifery license to 29 because of violations of the sanitary code. Although there remain but 31 midwives, it would seem high time for New York City to write the final note in this archaic phase of obstetrics. It is hoped that other cities will follow example, lest the current hospital bed shortages temporarily encourage a return to midwifery. Such shortages are being met satisfactorily by employing early ambulation pending further expansion of maternity services.

Stander³ has summed up the problems as follows "No case in obstetrics is simple and safe and should not be so regarded until you have a healthy mother and baby at the end of the puerperium There is no other field in medicine where a perfectly healthy patient can suddenly, within minutes, become a seriously and fatally ill This holds true just as much for the multiparous woman as for the primipara provement in obstetrics cannot be accomplished by reverting to an archaic form of midwife practice by which two lives, those of the mother and her child, are entrusted to the hands of persons uneducated and untrained in most of the fundamental medical sciences and only partly schooled in one of the clinical branches of medicine, without any knowledge whatsoever of gynecology, an absolute essential in the workup of anyone who undertakes the medical supervision of pregnancy and parturation If we really believe that the midwife can replace us in this work, it is time for us to consider whether there is any sound excuse for the existence of our medical schools, as far as obstetrics is concerned I would no more wish to see the surgeons hand back some of their operating to the barbers or barber surgeons, than I would nant to have us, obstetricians, revert back to our own ancestral system of midwives"

Summary

A brief history of midwifery practice in New York City, demonstrating the constantly diminishing role which the midwife is playing in obstetric practice, is presented. The inadequacy of midwife maternity care is demonstrated and some of the reasons for the analysis.

Conclusion

The practice of midwifery in New York City should be abolished

THE DODO FLIES AGAIN With the adjournment of the 1917 California State Legislature and more recently with the ad journment of the first session of the Lightieth Congress, word has been passed around in some medical circles that the issue of compulsory health insurance is as dead as a dodo. While such word is reassuring, we are beginning to wonder whether we should accept it as gospel.

A few recent incidents might serve to refresh our memories and to give us pause to consider whether or not compulsory health insurance has actually died Possibly it has only gone to sleep to awaken at a

more propitious moment

Consider for instance the action of the California State Federation of Labor (A. F of L.) in circulat ing a statement before the Senate Subcommittee of the Committee on Labor and Welfare a statement which branded the California Medical Association with asserted unconsciousness to public needs and disregard for sound social betterment

Consider again the State Federation of Labor in writing to every member of the California State Logulature to blast the C.M.A for introducing a legislative bill which would ease the burden of selling voluntary health insurance by simplifying the selling process without depriving any individual of the right of self-determination. The State Federation of Labor calla this compulsory health maurance which it claims is a medical scheme to channel all voluntary health insurance into the hands of the doctors.

These items are in the record now and after a one-day spell, out of the headlines. However they are still in the minds of some legislators Likewise in the legislative minds are memories of a recent labor blast against Senator Robert A Taft of Ohio who was accused in a labor convention of being anti-labor because he had opposed a health insurance program which the convention labeled as President Truman's but which we refer to as the Wagner Murray Dingell Bill Senator Taft may be vulner able to labor's attack on other grounds but this one is something new

The final consideration is in the program of the California State Democratic Party which has adopted health insurance as one of its goals has just happened and it means that every Democratic candidate in this state may be called upon by his party to espouse this brand of social soothing вутир

The labor actions mentioned here might be ex pected as a part of labor's program of demanding its own way But when these moves impinge upon the collective mind of the law making bodies of the country they represent political action they enter that stage they represent a problem which organized medicine must meet if socializations of medical practice is to be avoided Medicine has the weapons available to it to wage the fight needed all it needs is the will to use these weapons the medical sootheayers have their way organised medicine would stack its weapons behind the door to collect dust

If the threat of socialized medicine is properly described in simile with the dodo we strongly suspoet that the ornithologists are misinformed as to the death of this bird -California Medical Septem

DEADLINE ANNOUNCED FOR APPLICATIONS

Applications for Part I of the examination of the American Board of Orthopedic Surgery must be received by the secretary Dr Francis VI McKeever 1136 West 6th Street, Los An-

goles 14 California not later than January 15 1948 Information relative to examining centers and dates will be announced at a later date according to the secretary

MODIFICATION OF THE INCISION FOR LAPAROTRACHELOTOMY

J THORNTON WALLACE, MD, FACS, and HARVEY J MERK, MD, Brooklyn, New York (From the Department of Obstetrics and Gynecology of the Brooklyn Hospital and the Long Island College of Medicine)

IT HAS been the experience and observation of the writers that incision of the uterine wall in low-flap cesarean section is a procedure oftentimes accompanied by haste, much blood and ammotic fluid, and at least some "blind surgery" as a result of the presence of this blood and fluid This is true to a greater extent when the incision is transverse rather than longitudinal, as the farther out to each side the incision is extended. the larger and more abundant is the blood supply It is also more likely to occur if the patient has not been in labor, with a consequently thicker lower uterine segment The natural tendency when brisk bleeding from the incised uterine wall is encountered is to make greater haste in completing the incision and extracting the baby and placenta, whereas the more logical procedure would be to pause and secure hemostasis instead

This bleeding, if not controlled, will continue until well after delivery of the baby and placenta. A method whereby this type of bleeding may be controlled promptly as encountered, along with certain other advantages, will be described

Quite by accident, when doing a repeat cesarean section in which there was a small rupture of the uterine scar with a pouch of membranes protruding through it, the idea occurred to the senior author that he might be able to complete the entire incision in the thinned out lower segment without rupturing the membranes. This was accordingly done with surprising ease. In this particular case, there was a minimum of bleeding and the entire incision was made without haste or guesswork as to its proper length before rupture of protruding membranes.

Since that time all the cesarean sections done by the writers and a large majority of those done by other members of the staff of the Brooklyn Hospital have been performed with this idea in mind

As most of our sections are now done under fractional spinal anesthesia, no initial haste in getting the baby out is necessary

Technic

After dissecting the bladder flap up and off the lower uterine segment, being careful to get into and remain in a relatively bloodless plane of cleavage, an incision 2 cm long across the mid-

line, low in the thin lower segment, is begun and carefully carried through the wall, layer at a time, until the membranes are reached and exposed (Fig 1)

As the membranes are approached greater and greater care must be exercised to avoid rupturing them Bleeding in this area is usually minimal Should this not be the case, another such area on one side or the other of the originally selected site for incision may be found to be less vascular (Fig 2) A Ford T clamp is placed on both the upper and lower edges of the incision to act as tractors as well as hemostats The opening which thus has been made in the uterine wall is just about large enough to admit the index finger comfortably The membranes are now "stripped loose" from the overlying uterine wall laterally on either side beneath the line of proposed incision in the uterine wall just as they are sometimes "stripped" vaginally through the cervix to induce labor Some of our operators have pre-

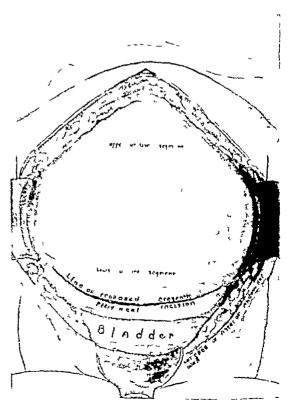

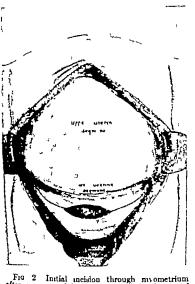

Fig 1 Exposed uterus before reflexion of bladder

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Obstetrics and Gynecology May 8 1947

after exposure of lower segment by reflexion of bladder flap.

ferred doing this with the handle of a knife or curved scissors (Fig. 3)

Bandage sensors are now introduced and the incision carefully extended far enough to the right for two fingers to be introduced between the membranes and uterine wall The incision may now, without haste be carried laterally as far as desired, either with bandage scissors or a knife, and with the fingers underneath the uterine wall to protect the membranes. This procedure is now repeated on the left When a large vessel is opened a long handled Ford clamp is applied to act both as a hemostat and later as a tractor If the uterine wall is so tightly drawn over the presenting part that fingers cannot be inserted beneath it, the incision may still be carried for ward with bandage scissors alone with but little more danger of rupturing the membranes. The field may thus be kept virtually dry and much subsequent blood loss prevented during the delivery of the baby placenta, and repair of the in cision (Fig. 4)

When the incision has been enlarged to the necessary length and hemostasis obtained, a small opening is made in the protruding membranes and a suction tube introduced through it. This usually may be done in such a way that most of the ammiotic fluid can be removed from the

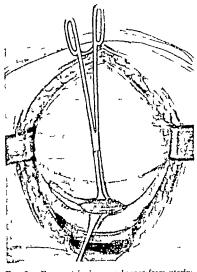

Fig. 3 Finger stripping membranes from uterim wall

uterine cavity before opening the membranes throughout the length of the mension The long handled Ford clamps are now turned up or down depending upon whether they are on the upper or lower edge of the incision, to get them out of the way, and the baby and placenta delivered in the usual manner These clamps originally are set in such a way as not only to obtain hemostasis but to outline the angles and upper and lower edges of the incision as well They now may be lifted up in line and repair of the incision may proceed in a practically bloodless field. It is wise to count the Ford clamps set along the incision and to make certain that all are accounted for at closure, as one occasionally may pull off a very thin uterine wall However this usually may be prevented by setting the outside blade of the T clamp far enough back on the uterine wall to in clude a good bite of tissue before closing and locking it (Fig. 5)

The advantages of this procedure are several Even if the operation is under general anexthesia the added two or three minutes consumed in making the incision in this fashion are more than compensated for by the decreased blood loss to the mother and the consequent increase in oxygenation of the baby's blood. The danger of making too small a uterine inclision with tearing at the

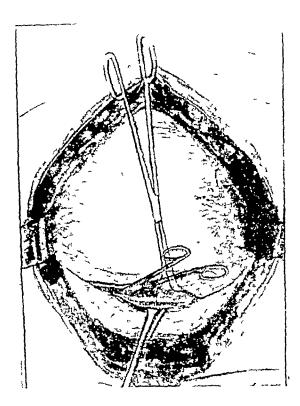

Fig 4 Completion of uterine incision with bandage

angles in delivery of the vertex definitely is lessened Enough time may be taken under unobscured vision to curve both ends of the incision well upward so that if perchance there is tearing, it will be in this direction rather than laterally It will make it virtually impossible to suture the upper edge of the incision to the posterior wall of the lower uterine segment instead of the lower edge of the incision, as has been done in the past If carried out successfully, it will be impossible for the operator to cut a baby's face or other part, as likewise has been done. It gives time and opportunity for making the incision smooth and even, rather than ragged and irregular With care it can be done in practically all cases in which the membranes are intact

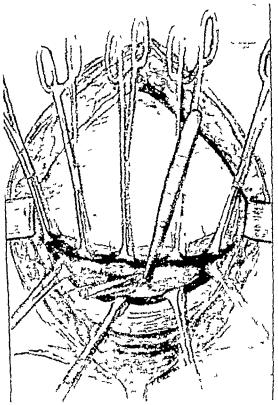

Fig. 5 Ford clamps in place, incision of the ammotic sac

and in a majority of those in which the membranes are ruptured. We have used it in extraperitoneal sections and in sections where a longitudinal rather than a transverse incision was used. In 2 cases of placenta previa, the condition in which this technic is most likely to fail, the edge of the placenta has presented in the incision. In both instances the placenta was pushed down, the membranes ruptured well above the presenting edge, and the baby extracted before the placental bed was disturbed

Note The authors wish to express their gratitude and appreciation to Miss M Ludeman for her cooperation in preparing the drawings used in illustrating the text and to Drs. John Casagrande and Florence Wilson for the use of their material in the preparation of the motion picture film used in connection with the presentation of this paper

KING'S ENGLISH SIMPLIFIED

From a prominent medical journal, in an article dealing with the "metabolism of natural estrogens," the following illumination was gleaned—"The chromatographic dispersion of the estrogens in these aliquot portions of the cluate is similar to that shown by ternary mixtures of crystalline estrone estradiol, and estriol in pure solution"

JAUNDICE AND LIVER FUNCTION TESTS

To What Extent Are They Necessary?

Brron D St John, M D Port Washington, New York

(From the Meadowbrook Hospital)

TAUNDICE is a yellow staining of the skin, I mucous membranes, and conjunctive by the escape to these tissues of an excess of bile pig ment (bilirubin) built up in the blood bilirubin appears in the urine and aweat, but is absent from the stool, cerebrospinal fluid, and salıva

Physiology of Jaundice

Bilirubin is formed by the destruction of red blood cells in the reticuloendothelial system, such as bone marrow, spleen, and liver This is proved by the fact that there is more bilirubin in the blood of the splenic vein than in the blood of the spleme artery Normally there is present 0.2 to 0.8 mg. per cent of bilirubin in the blood bilirubin travels to the liver where it is removed from the blood and goes through the biliary tracts to the common duct and then to the duodenum where, by the action of bacteria, it becomes urobilinogen Some of this urobilinogen passes through the intestinal tract and becomes oxidized to urobilin A small amount of this urobilinogen escapes into the general circulation and is excreted by the kidney where it is also oxidized to urobilin The greater portion of the urobilinogen is returned by the portal circulation to the liver and is re-excreted by that organ

Classification of Jaundice

- Obstructive jaundice 2. Nonobstructive jaundice
 - - (a) Hemolytic jaundice
 - (b) Toxic jaundice

Obstructive Jaundice - This is caused by an obstruction of the flow of bile through the common duct. This may be brought about by obstruction within the duct such as stones, para ates, plug of thick mucus, tumor, or inflamma tion of the duct It may be brought about by obstruction of the flow of bile by pressure upon the common duct by a tumor of a neighboring or gan, such as carcinoma of the head of the pan creas, and it may be brought about by atresia or congenital absence of the common duct which is sen in the newborn. For the purpose of illustration, let us place a stone in the common duct. No bile can pass this stone The normal amount of bilirubin present in the blood is being delivered to the liver and bile is being excreted by the liver cells, but none of it can escape into the duodenum and the bilirubin builds up in the blood stream and, therefore, we have jaundice

Nonobstructive Jaundice -(a) Hemolytic jaun dice is frequently a familial disease in which there is excessive destruction of red blood cells, causing the blood to deliver more bilirubin to the liver than that organ can handle and the excess is thrown back into the blood thus causing jaun dice however, there is no obstruction as in the There are a number of hemocondition above lytic agents, including the toxins of some bac ternal infection, such as malaria and septicemia, and the poisons of pernicious anemia and hemolytic disease such as arseniuretted hydrogen and dinitrophenol which will cause jaundice

(b) Toxic jaundice will show more extensive damage and depression of the secretory functions of the liver and is produced by heavy metals and other poisons, such as arephenamine chloroform, phosphorus, cinchophen trinitrotoluene, or the damage as seen in diabetic cirrhosis and cardiac cirrhosis Any of these may produce saundice and again there is no obstruction in the common duct

Functions of the Liver

It is now necessary to enumerate a few of the known functions of the liver

- Exerction of bilirubin
- Manufacture and secretion of bile
- Excretion of alkaline phosphatase
- Protein metabolism Deamination of amino acids and the regulation of the albuminglobulin ratio
- Storage of glycogen and regulation of blood sugar with the help of the pancreas and ad renals
- Production and storage of prothrombin and antianemic factor
- Synthesis of hippuric acid by conjugation of benzoic acid and glycine
 - Acetylization of the sulfonamides
 - Heparin production 9
 - Iron and copper storage 10
 - Reticuloendothelial activity (liver) 11
 - 12 Fat metabolism
- Heat production and storage of vitamin B
- 13 Formation of vitamin A from carotene

7.77

Detoxification and many more functions that are either vaguely known or unknown

Liver Function Tests

Tests for Storage Function of the Liver -The ability of the liver to store glycogen is tested by the levulose tolerance test in which the blood sugar curve is determined after the patient has taken 50 Gm of pure levulose dissolved in 250 cc The undamaged liver will store enough of the sugar to cause only a slight rise in the blood Under this heading there is the galactose tolerance test, in which the fasting patient is given 40 Gm of galactose in 500 cc of water This sugar is converted to glycogen with considerable difficulty Normally, 3 Gm or less are excreted in the urine within five hours, but if the liver is damaged and unable to convert the galactose to glycogen, the excretion in the urine rises to 4 or 5 Gm in the first five hours This test is of some value in obstructive jaundice, because the findings will be the same as in the normal liver, 1e, 3 Gm or less in the urine

Tests for the Excretory Functions of the Liver —

(a) Blood bilirubin will show if there is an ex cess of bilirubin in the blood

(b) Urobilin test of the urine, which is a simple office procedure, will show whether any bile is entering the duodenum where it is converted to urobilinogen, and later to urobilin

(c) Serum alkaline phosphatase estimation will show a backing up in the blood of phosphatase that should be excreted by the liver

(d) Protein metabolism as shown by the cephalin flocculation test

(c) Protein metabolism as shown by the serum protein and the albumin-globulin ratio (Normal serum protein 71 Gm per cent, Albumin 41 Gm per cent, globulin 2 7 Gm per cent, fibrinogen 027 Gm per cent, albumin-globulin ratio 151 Gm per cent)

(f) Increase in coagulation time due to lack of bile in the intestinal tract to activate vitamin K

(g) Van den Bergh test, direct and indirect

(h) Bromsulfalein and Rose-bengal tests are of value only if the bile ducts are clear

(1) Detoxification function test In this test 5 9 Gm benzoic acid is given by mouth specimens of urine for four hours are examined for hippuric acid A fairly efficient liver will excrete 3 to 31/2 Gm in four hours

(j) Formaldehyde gel test

Tests to Bc Used in Obstructive Jaundice -

(1) The first liver function test should be an examination of the urine for urobilin You will see from the diagram (Fig 1)1 that, if there is a complete obstruction of the common duct, no bile will enter the intestine, and, therefore, there

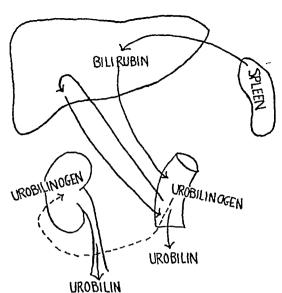

Diagram showing the formation of bilirubin from destroyed red blood cells in the spleen and the change of bilirubin to urobilinogen in the intestine, its exerction in part as urobilin in the feces and its absorption in part into the portal blood where it is re-excreted from the liver The dotted line represents the passage of urobilinogen from the intestine to the kidney, where it is excreted and oxidized to urobilin

will be no urobilin in the urine, if jaundice is a few days old

(2) Examination of the blood for bilirubin Serial examinations will show increase or decrease of jaundice

(3) Serum alkalıne phosphatase determina-Since the liver excretes this enzyme, the amount in the blood will increase greatly in obstructive isundice

(4) Hanger's cephalin flocculation test test, when done with fresh material, is very satisfactory and a positive test is against obstuctive jaundice

Any one of these tests may be positive in a patient with a normal liver function, but if two or three of them are comparably positive, you may be reasonably sure of liver damage. For example, if the serum alkaline phosphatase and cephalin flocculation tests are strongly positive, it is strong evidence in favor of altered liver function.

It also should be borne in mind that early in a case of simple obstructive jaundice the only findings will be increased serum bilirubin with slight jaundice, dark urine, and light-colored stools Due to blocking the flow of bile, the jaundice becomes deeper, the unne darker, the stools clay-colored, and the other liver function tests for obstructive nundice become positive If this obstruction is not relieved, the liver will be damaged and then the liver function test for both obstructive and nonobstructive jaundice will be nositive

Tests for Nonobstructive Jaundice —These are even less satisfactory than those for obstructive jaundice Lippincott et al gives an exhaustive report of liver function tests in soldiers with schistosomiasis japonica, under treatment with antimony compounds, "the initial studies of hepatic function showed the following incidence of abnormal results, globulin 5 per cent, formal dehyde gel 1 per cent. icterus index 4 per cent. serum bilirubin 6 per cent, urobilinogen 0 per cent, intravenous hippune acid 5 per cent galactose tolerance 4 per cent, bromsulfalein 12 per cent."2 It is, therefore, suggestive that minor liver damage can be detected best by the brom sulfalein test and serum bilirubin determination

Again the importance of the history and physical examination should be stressed A history of familial hemolytic jaundice or the taking of some drug will be much more valuable than the hver function tests.

Establishing the Cause of Jaundice

It is now time to consider a patient with jaundice and it is at this point that many an hour of valuable laboratory time is wasted on unnecessary and poorly chosen liver function tests Yone of the above liver function tests should be done until after an exhaustive history and com plete physical examination, including standard laboratory and x ray procedures have been done Your first interest in the jaundice is the question of obstruction and an exploratory laparotomy may be a life-saving procedure at this time, because what was supposedly a hopeless carcinoma of the head of the pancreas may turn out to be a stone in the common duct, or some other benign con dition. Please bear in mind that surgical intervention is not indicated in every case of jaundice and that the cases for surgery must be chosen

There is a tendency at present to excarefully plore nearly every case of jaundice and this is not a good procedure

The surgeon should view with suspicion the case he is about to operate that presents spider angiomata of the skin, pitting edoma, unex plained anemia, or hypoproteinemia rule applies to the jaundiced patient with tem perature awollen and tender liver, and, also, to the patient with a history of having had in the past four to eight months a transfusion of blood or plasma or a justory of having been vaccinated for small por

Conclusion

For treatment of a patient with joundice an exhaustive history, careful physical examination, rou tine inboratory and x-ray procedures, and surgical consultation all should be carefully studied in an attempt to arrive at a diagnosis. If the diag nous is not made, then the physician should decide what liver functions he wishes to test and then select two or three of the following liver function tests

- Examination of the urine for urobilin (office procedure)
 - Serum bilirubin
 - Serum protein and AG ratio
 - Serum alkaline phosphatase
 - Hanger's cephalin flocculation test 5
 - Galactose tolerance test
 - Bromsulfalein test

These tests are far from satisfactory and, until better procedures are evolved greater stress must be placed upon the history, physical examination. and other standard procedures

STATE SOCIETIES URGED TO ACT ON HOSPITAL PROGRAM

One of the urgent problems brought up at the August meeting of the Joint Committee for the Coordination of Medical Activities is the need for all state medical societies to take an active part in the Hospital Survey and Construction Program. Dr Ernest Irona, chairman of the committee urges Dr. Ernest Irons, chairman of the committee ungesthat each state medical society find out the present status of the program and offer its assistance in seeing to it that funds are allocated where they can do the most good.

The program of this sat is to halo the states and

The purpose of this act is to help the states and

local communities build hospitals and establish health centers where they are most needed order to realize this purpose the committee believes it will be necessary for each state medical society to particulate actively in the state survey. The participate actively in the state survey. The Council on Medical Service plans to coordinate information on activities of the various state com mittees.

What is the status of the Hospital Survey and Construction Act in your state?—News Letter American Medical Association, October 23 1947

THE USE OF SODIUM NICOTINATE IN THE TREATMENT OF HEADACHE

Arnold P Friedman, M D, * and Charles Brenner, M D, New York City

(From the Division of Neuropsychiatry, Montefiore Hospital, and the College of Physicians and Surgeons. Columbia University)

IN A RECENT article Goldzieher and Popkin reported considerable success in the treatment of various types of headaches by the intravenous injection of 100 mg of sodium nicotinate (Naotin) 1 They recommended the procedure for the "symptomatic treatment of (a) severe idiopathic headache, (b) migraine, and (c) postspinal tap cephalalgia "

The value of a successful, easily administered and harmless symptomatic therapy for severe headache is obvious, and, in an effort to confirm Goldzieher and Popkin's results, we have administered 100 mg of sodium nicotinate intravenously to 80 patients who were complaining of headache The results are summarized in Table 1 Goldzieher and Popkin secured complete relief of symptoms in 74 per cent of 57 patients classified of sodium nicotin ite is not of greater value than the intravenous injection of a small amount of Each of the 7 patients with sodium chloride migraine experienced symptomatic relief from the subcutaneous injection of dihydroergotamine (DHE-45) after the injection of sodium nicotinite had proved ineffective

Summary

The intravenous injection of 100 mg of sodium nicotinate produced no relief of pain in any of 7 patients during an acute migraine attack, and was no more effective in the symptomatic relief of patients with psychogenic or posttraumatic headache than was the intravenous injection of a small amount of a physiologic solution of sodium chloride

TABLE 1 -RESULTS OF TREATMENT BY THE INTRIVENOUS INJECTION OF SODIUM NICOTIVATE

THE CONSERVATIVE TREATMENT OF ECLAMPSIA WITH EMPHASIS ON THE STROGANOFF METHOD

KARL M WILSON M.D , Rochester New York

(From the Department of Obstetrics and Gynecology University of Rochester)

WHEN one considers the results obtained in the treatment of eclampsia today as compared with those obtained a generation ago, it is obvious from the various series reported that, while the results obtained are still far from ideal, there has been a very real improvement. In the absence of an exact knowledge of the cause of the disease, however, the treatment is still empiric

In the past the mode of procedure usually adopted in the treatment of ante- and intra partium celampsia was to effect immediate delivery no matter what the condition of the patient. This involved many major operative procedures from the old accouchement force to vaginal hysterotomy and abdominal cesarean section. The results were poor, with a general average numerical mortality of from 25 to 30 per cent. Unquestionably, many of these women died as a result of the treatment rather than from the discuss itself.

Case Reports

1—One of the most striking reports on the results of these old methods of treatment is that of Lichen stein from the Lepzig Clime in 1912.

In this series there were 400 cases of eclampsia with a gross maternal mortality of 18 5 per cent the mortality for the antepartum intrapartum, and post partum varieties being 28.5 12 6 and 27 14 per cent respectively Practically all of the antepartum and intrapartum cases were subjected to some form of operative delivery Analyzing the results Lichtenstein found that in general, the patients who did well were those who had lost considerable blood at the time of delivery and he felt that this blood loss was the chief therapeutic benefit derived from delivery Furthermore with the high mortality of 27 14 per cent in the postpartum cases he inquired why these results should be so poor if early delivery has any effect on the disease since in these cases one has the earliest possible delivery namely before the outbreak of the attack. As a result of his observa tions in this series, he became a strong advocate of venescetion as a mode of therapy and the adoption of this procedure was followed by prompt improvement in the results obtained

2—An impressive collection of cases was compiled by Plass in 1927: In this tabulation of reports by various authors he found that in 4 607 cases of oclampas treated by radical measures that is by immediate operative delivery the gross maternal mortality was 21 7 per cent whereas in 5 970 cases

Presented at the 141st Annual Meeting f the Medical Society of the State of New York, Buffalo Section on Obstatrics and Gynecology May 7 1947 by conservative therapy the maternal mortality was only 11 1 per cent

Since 1912 the tendency has been toward various methods of conservative therapy with a general improvement in the results obtained One of the oldest of these is the so-called Dublin method, essentially an active elimination mode of therapy. Others are directed toward control of convulsions by sedatives which affect the nervous system. Among them may be mentioned the Macpherson method involving frequent doses of morphia, the intravenous injection of magnesium sulfate as used by Lazard and the Stroganoff method

My own interest in the Stroganoff method was aroused by Stander's report after his vast to Stroganoff's Clinic in Moscow's Following Stander's report the method was adopted at the Johns Hopkins Hospital with improved results. Shortly afterwards in 1926 our clinic in Rochestre opened and I decided to treat 100 conservative cases by the Stroganoff method, in order to appring its value. After twenty years we still have not had 100 such cases but we have had a sufficient number to present for discussion.

Our celamptic material consists of 66 cases all treated by a modification of the Stroganoff method. These cases occurred in 20,940 deliveries an incidence of 1 in 317 deliveries.

As carried out by us the method is as follows

1 ON ADMISSION

- (a) The patient is placed in a darkened room and kept as quiet as possible preferably under the constant supervision of a special nurse. The patient should be kept warm.
- (b) The patient should lie on her side with the foot of the bed elevated in order to facilitate pharyngeal drainage.
- (c) Morphine 0 015 Cm (¹/4 grain), is given at once hypodermically unless the patient received a similar dose prior to admission
- (d) A catheterized specimen is obtained and sufficient blood is withdrawn by vena puncture for the necessary chemical studies
- (e) If not edematous the patient when conscious is allowed to drink water freely. If the patient cannot drink, 500 cc of 5 per cent glucose may be ad ministered introvenously.

- 2 One hour after admission 2 Gm of chloral hydrate in 100 cc of saline or milk is given rectally
- 3 Three hours later the 0 015 Gm of morphia (no more than 0 030 Gm in 24 hours) is repeated
- 4 Three hours later 2 Gm of chloral hydrate is given
- 5 Six hours later 1 5 Gm of chloral hydrate
- 6 Eight hours later 1 5 Gm of chloral hydrate

If the above procedure is followed, a total period of 21 hours elapses between the time of admission and the last administration of chloral By this time there should be good evidence of recovery if such is to be the result I would emphasize, however, that the above routine should not be meticulously followed, if a full course of therapy is not necessary Thus, several of our patients ceased having convulsions after the initial dose of morphia, while others responded after further medication but before the full course of therapy was completed If the patient's improvement warrants it, the treatment may be suspended at any point along the line of No attempt at delivery is made the routine until the cervix is fully dilated

In our series of 66 cases, there were 35 examples of antepartum eclampsia with six maternal deaths, a mortality for this group of 17 1 per cent, one a cardiac death, one due to cerebral hemorrhage, another to bronchopneumonia, while two died undelivered Operative procedures in this group included six low- and one midforceps operations. There were 18 fetal deaths, a mortality of 51 4 per cent, but of these only three were full-term babies. The other fifteen were either immature or markedly premature (all weighing less than 2300 Gm.)

Included in this antepartum group were 19 women, who under the Stroganoff treatment stopped having convulsions and improved markedly, but did not go into labor In these women labor was induced three days to two weeks later by some simple measure, such as medical induction with rupture of the membranes, or by introduction of a hydrostatic bag All of these women This group of so-called intercurrent eclampsia represents one of the important results obtained from conservative therapy tients improved markedly but not completely enough so that it seemed advisable to allow the pregnancy to continue However, the pregnancy could now be terminated at a more or less elective time by a simple and safe mode of procedure without resorting to a major operation

In our series there were 18 examples of intrapartum eclampsia. These were treated in a similar manner with treatment starting during labor as soon as the first convulsion occurred All eighteen patients recovered, but there were six fetal deaths, a mortality of 33 3 per cent. Three of these infants were premature. Operative procedures carried out in this group included ten low- and two midforceps operations, one version and extraction, one breech extraction, and one low cervical cesarean section. This latter is the only cesarean section in our entire series, and it was performed because of a contracted pelvis after a test of labor. Both mother and baby survived.

In the postpartum group there were 13 cases, all of which recovered One infant was born dead before the onset of convulsions as the result of a placenta previa The gross results are presented in Tables 1 and 2

TABLE 1 -MATERNAL MORTALITY

	Number	Maternal	Mortality
	of Cases	Deaths	Per Cent
Antepartum	35	0	17
Intrapartum	18	0	0
Postpartum	13	0	0
Total	66	6	9 9

TABLE 2 -FETAL MORTALITY

	Number of Infants	and	Born Dead or Died in 2 Weeks	Mortahty
Antepartum Intrapartum	35 18	17 12	18 6	51 4 33 3
Postpartum	One set of	12	ĭ	7
Total	67	41	25	37 3

Summary and Discussion

Sixty-six cases of eclampsia are presented, all treated by a modification of the Stroganoff method, with a gross maternal mortality of 99 per cent and a fetal and neonatal mortality of 37 3 per cent All the maternal deaths occurred in the antepartum group, possibly due to the fact that many of these patients were unregistered, had had no prenatal care, and came to the hospital only after the attack began Three of the six deaths were due to associated complications cardiac, cerebral, and pulmonary, which must be counted as eclamptic deaths The lack of maternal mortality in the intrapartum and postpartum groups is due, at least in part, to the fact that many of these patients had been admitted to the hospital on account of a preeclamptic toxemia and had had at least some therapy before the onset of convulsive seizures

The fetal mortality in eclampsia will probably always be high, since many of the infants are either very premature or even nonviable. No attempt has been made to subdivide our material into so-called mild or severe types. Criteria for

such differentiation vary widely and are, largely, the ideas of the particular individual. I prefer to regard all cases of eclamosia as representing a very serious situation, although, of course, some may be much more severe than others.

The results obtained in this series treated by the Stroganoff method are far superior to those formerly obtained by radical therapy and compare favorably with those obtained from other

methods of conservative therapy

The Dublin procedure the use of intravenous magnesium sulfate, and the Stroganoff method. all appear to give equally satisfactory results. It is not my purpose to advocate the Stroganoff method as being superior to the others, results obtained do not permit such a conclusion to be drawn. However, one important advantage of the Stroganoff method is its simplicity, it can be carried out in the home if circumstances make home treatment necessary

The important feature to emphasize is that results obtained from any of these conservative measures, empiric though the methods may be, are far superior to those obtained by the use of radical operative procedures. In my opinion major operative procedures, such as cesarean section, have no place in the treatment of eclampma unless there is some other complicating factor like mechanical obstruction which necessitates such a method of procedure

Conclusions

- Sixty-six cases of eclampsia treated by a modified Stroganoff method are presented with a gross maternal mortality of 9 9 per cent
- While there are other conservative methods available, this is to be regarded as a useful one until our knowledge of the disease permits the abandonment of all empire therapy
- The results obtained from any of the reliable conservative methods of therapy are far superior to those obtained by radical intervention Cesarean section and other major operative procedures have no place in the treatment of eclampsia unless associated factors are present which give indication of a need for such operative procedures. No attempt at delivery should be made until the cervix is fully dilated, when the operative procedure involved will be a sample one.
- 4. Finally, the prevention of eclampsia is just as or more important than the cure, and the great majority of cases can be prevented if proper prenatal supervision is carried out

EVERYDAY LEVEL URGED FOR RELIGION

The trouble with most prayers and hymns is not that they are insuncere but that they are not at the level on which we are living, the Rev Dr Jonathan P. Evans, munister of the Vaucluse Congregational Church, Sydney Australia, declared in a recent sermen. sermon.

"Because people don't go about their work in a state of ecstasy it doesn't indicate a lack of re-

ligion, he said.

"We have times when we come into the presence."

The spirit of God but these moments come rarely The spirit

of religion is shown by the way you do your daily work, by being tolerant and courteous and by keeping a sense of humor
"We are apt to feel that since our life is without

emotional drive or semsation, that we've missed the real spirit of religion. That is why religion must meet us on a routine level, and if it can t meet us there, it is of no use to us. If it can t meet us on the mundane days of the week, it cer tainly can t meet us formally on Sunday "-A I

Times November 17, 1947

Of this number, 462,304 (653 per cent) received the group audiometer test, 8,755 of these were found sufficiently defective to receive otologic examinations, 3,291 were recommended for treatment after the examination, while 922 were recommended for special education In other words, the cities with a total school population of 288,650 recommended 748 pupils for special education. The villages, central schools, and union-free schools with 419,207 pupils in all recommended 174 pupils. for special education, or approximately one fourth as many as the cities

Of the 748 recommended for special education reported by cities, 912 per cent received special education. Of the village school districts, 92 pupils were recommended for special education and 414 per cent received special education. Of the 414 per cent received special education. Of the central school districts, 24 were recommended for special education and one third received it (Central school districts have approximately one half the school population of all the school districts and recommended 27 as against 748 by the cities) The union-free schools with 117,191 pupils registered. as compared with 285,560 in the city schools, recommended 55 pupils for special education. and 43 pupils received it

TABLE 1 - SPECIAL EDUCATION

Pupils Recommended	Pupils Receiving	Percentage
Cities 748	682	91 2
Villages 92 Central schools 27	38 9	41 4 83 8
Union free schools 55	43	78 2

The variation in these numbers may be accounted for by the fact that the cities are more apt to have classes and clinics for the hard of hearing children

At present, the facilities of the State for the hard of hearing children, exclusive of New York City Buffalo, and Rochester, consist of Conservation of Hearing Classes in four cities-Albany, Gloversville, Schenectady, and Syracuse State and is provided for the maintenance of these classes Tuition for nonresident students is set by the local school superintendent. In addition to these four classes, twenty-eight communities offer lip reading classes for hard of hearing children. All but six of these are located in the metropolitan area, Long Island, and Westchester County The remaining six are distributed throughout the state as follows Auburn, Binghamton, Ithaca, Olean, Utica, and Watertown

Statistics for 1944 to 1945 show one child in every 53 of the 462,304 children tested had a loss of 15 decibels or more, one child in every 140 required treatment, one child in 500 was recommended for special education, one out of every 607 received special education

The entire Catskill and Adirondack areas have no rehabilitation facilities whatsoever In fact, north of the Erie Canal, Watertown and Gloversville stand out as the only communities attempting to meet the needs of their hard of hearing children In the heavily populated southern tier of the State, including the Finger Lakes region, Olean, Auburn, Ithaca, and Binghamton have lip reading classes. The only conservation of hearing classes are in a line—Albany, Schenectady, Gloversville, and Syracuse. How can we meet the needs of the hard of hearing child throughout the State so that urban and rural children can have equal privileges?

Conservation of Hearing Clinics -In approved hospitals these serve to correlate and assist in the proper selection and classification of the hard of hearing children They direct the children along the proper lines of therapy and education to facilitate rehabilitation

Two types of educational services are needed

Conservation of hearing classes should be established in public schools with a full-time teacher giving instruction in lip reading, speech correction, training in residual hearing, training in the use of a hearing aid, and coaching in school subjects should be located in large cities and towns, spaced throughout the State in proportion to the school population from which they would draw sufficient pupils to maintain such a class

Lip reading and speech correction classes are needed in school districts where there are no conservation of hearing classes There should be one teacher certified to teach lip reading and speech correction daily to those less severely deafened in that school population which does not require attendance at a conservation of hearing class This teacher could be a regular teacher in another subject such as English. The teacher's schedule, as a matter of fact, could be varied depending on the number of children with impaired hearing

To carry out this program for the hard of hearing child, there is a need for teachers who will devote their entire time to conservation of hearing classes and for other teachers whose regular program will be modified to include lip reading and speech correction for those children less severely dealened It is the responsibility of the colleges and universities in New York State to offer training to meet the needs of these two groups

CORRECTION

In the article by Dr Eugene Davidoff, Sonyea, New York, entitled "Tridione Therapy in Institu-tionalized Epileptic Patients," which appeared in the July 1, 1947 issue of the New York State Journal of Medicine, an error occurs

Page 1492, column 2, paragraph 3
The sentence should read "After a careful preliminary physical examination, the patients were placed on 0.3 Gm. of tridione three times daily,"

instead of "3 Gm of tridione," as printed

SYNCHRONOUS COLON CARCINOMAS OF MULTICENTRIC ORIGIN

WILLIAM SHEINFELD, M D, Brooklyn, New York

(From the Prospect Heights Hospital)

IN ANY definitive operation for carcinoma of the colon or rectum a systematic search for possible metastases by preoperative atudies and exploration preceding the actual resection, is performed routinaly Palpation of the entire colon and rectum is equally important to note whether a second or even a third lesion is present. Abel' reported 2 cases of multiple carcinomas in 131 cases of colon and rectal carcinoma, Cockkinis 1 4 in 54 cases of colon car cinoma, Brindley 5 8 in 306 cases of large intestinal cardinoma, and Borson and Berger 16 in 344 patients with cancer of the large intestine. This makes a total of 30 cases of multiple lesions in 835 cases of carcinoma of the colon and rectum, or an aggregate incidence of 3.5 per cent. In addition, a number of other case reports of multiple colon carcinomas can be found in the literature. 4-7 The following case illustrates the clinical importance of bearing the possibility of multiple lesions in mind. In addition, varying morphologic degrees of malig nancy in the several lemons present are shown.

Case Report

MI J a white woman, aged 62, was admitted to the Prospect Helghts Hospital on Jahuary 13 1947 and discharged February 1, 1947 Nine months prior to her present admission she was operated upon for chronic cholecystitis and cholelithiass. A cholecystectomy and incidental appendectomy were performed. The eccum at that time was normal to palpation. She was well five months and then began suffering from recurring attacks of addominal cramps. These were relieved by medication at first but became increasingly severe and frequent up to the time of admission. They were most marked in the epigastrium and about the midabdomen. A barium enema given two weeds before hospitalization revealed an obstructing filling defect in the miditransverse colon (Fig. 1). This was laterpreted as an intrinsic neoplasm with a possible complicating intussusception. The right colon could not be visualized. Physical examination on admission revealed a white woman of 62 in good general health not acutely ill, with negative findings. On abdominal examination the scar of the previous operation was noted. No other abnormalities could be found.

Laboratory Data —The white blood count was 7100 cells, with 49 per cent polymorphonuclears 46 per cent lymphocytes, 4 monocytes, 1 cosinophil red blood cells 3,840,000 with hemoglobin 72 per cent, total protein 5 74 Gm. per cent albumin 3,99 Gm. per cent, globulin 1 53 Gm. per cent A/G ratio 2,0 1 Blood sugar was 95.2 mg. per cent urea 7.8 mg. per cent urea and chlorides 600 mg. per cent The urine was normal.

The patient was prepared for operation. Eightem grams of sulfasuxidine were given daily for six days. A low residue diet daily enemas, and colonic irrigations were given for several days before operation.

Fig. 1 Barium enems showing large filling defect in transverse colon. Some barium has passed beyond the lesion

On January 16 1947 exploration was done through a right rectus incision (W S) The mass in the transverse colon was a partial intussusception readily reduced. A soft large polypoid mass almost completely occluding the lumen was then felt. The entire large intestine was pelpeted. A hard mass involving the occum was noted. This had the typical appearance of carcinoma and was a surprise finding. The descending colon and rectum were normal. There was no evidence of glandular, hepatic, or peritoneal metastases. The terminal lieum, right colon and most of the transverse colon were resected. The splenic flexure was mobilized and brought down. The open end of the large intestine was inverted, closed and an open end-to-side lieocolostomy performed. The greater omentum was removed with the transverse colon. A complementary valvular ileostomy was made the catheater being brought out through a stab wound to the left of the incision.

With the exception of some evidence of peritoneal infection or irritation present from the fourth to seventh postoperative days and then subsiding, convalescence was uneventful. The wound healed by primary intention and the fleostomy closed twenty four hours after the catheter was withdrawn.

Report of Pathologist.—The gross and microscopic pathology are described by Dr Sillik Polayes. The specimen includes 15 cm. of distal ileum and

Fig 2 Gross specimen showing the malignant ulcer at the ileocecal junction (large arrow) and large polypoid mass (small arrow) in transverse colon. The small polyp has been removed for sectioning hence it is not present in the specimen. Note the complex mass of multiple polyps constituting the main polypoid mass. It appears grossly malignant. Microscopically, however, only incipient malignant changes are demonstrable. See Fig. 5.

Fig 3 Section through the malignant ulcer at the deoceeal junction showing malignant glands (B), arising in and decreating through the mucosa (A) The malignant glands have penetrated the

about 40 cm of colon (Fig 2) About 3 cm. from the ileocecal junction there is a malignant ulcerative mass in the cecum almost completely annular. The edges are raised firm and red. At the base of the ulcer the lesion infiltrates the entire wall of the cecum. About 1 cm. distal to the ulcer, a polyp, 1 cm. in length, hangs from the mucosa by a narrow pedicle. About 11 cm. from the distal end of the resected gut there is a sessile blue-red papillary growth about 7 cm. in greatest dimension. It protrudes into the lumen and causes partial intussusception of the proximal colon into the distal. The polypoid mass is well demarcated from the adjacent edematous mucosa and does not show involvement of the wall

The pertinent histologic features are given in the

legends describing the illustrations

Diagnosis —Adenocarcinoma of cecum, incipient malignancy of polyp in transverse colon, polyp of cecum.

Summary and Conclusion

- 1 Multiple colonic lesions appear in an appreciable percentage of cases and always should be looked for
- 2 Adequate therapy consists of radial surgery suitably applied to the problem at hand.
 - 3 A case is presented illustrating these points
- 4 The microscopic pathology of the several lesions encountered in this case demonstrates his-

Fig 4 Section through the large polypoid mass in the transverse colon showing one pedicle (A) of the complex structure of multiple polyps constituting the mass. Note that there is no epithelial invasion of the pedicle (A) or of the well of the colon

CHEST PHYSICIANS TO MEET

The New York State Chapter of the American Congress of Chest Physicians will hold a selectific meeting at the Hotel New Yorker New York City, on January 29 1948. In addition to morning and

afternoon scientific sessions a banquet will be held in the evening.

All members of the medical profession interested in chest diseases are welcome.

Nors: I wish to thank Dr Silik Polayes for his kindness in selecting the sections for illustration, in marking the photographs, and writing the legands of Figs. 2 to 6.

UNTOWARD SIDE-EFFECT FOLLOWING BENADRYL ADMINISTRATION

HARRY SWARTZ, M D, New York City

SINCE March, 1946, when benadryl (beta-dimethylaminoethyl benzhydryl ether hydrochloride) became available to the medical profession, many undesirable effects following its usage have been reported. These effects vary in intensity and duration involving one or a combination of many systems, or are localized to a particular anatomic area. For the most part, these effects have been attributed to the toxic action of the drug

Recently, however, several instances of quite paradoxical side-reactions have been recorded in the literature Benadryl, given because of its potent antihistaminic action for the relief of allergic manifestations, has been noted to precipitate such mani-Waldbott reports three instances of festations spontaneous asthma after the administration of this drug,1 Friedlander and Feinberg report a case of vasospasm of the fingers of one hand following benadryl,2 exacerbation of symptoms for which the drug was given is reported by Levin.3 Although no definitive investigations were made in these cases and, therefore, the manifestations arising after ingestion of benadryl might have been coincidental, it is most probable that they were specific allergic responses induced by hypersensitivity to the drug

Among the allergic symptom-complexes for which benadryl has been recommended and used is Ménière's disease. On the other hand, dizziness, nausea, and vomiting have been reported singly or in combination but always more or less transient in nature, as common side-effects of the drug. As far as can be determined, the literature does not describe an instance of true Mémère's disease as a benadryl side-effect. For this reason, the following case is reported.

Report of a Case

A 32-year-old white man with a thirteen-year history of sneezing, rhinorrhea, lacrimation, and itching of nose and eyes, beginning in the middle of May and lasting until October, had been treated for the past four seasons with excellent results. The treatment consisted of hyposensitization with timothy and ragweed pollen. Because, in the last year, symptoms began to extend perennially in mild degree, he was given the full complement of intradermal tests, found sensitive to multiple foods and inhalants in addition to his pollen sensitivity and, therefore, was placed on dietary and environmental control. He was placed on perennial therapy, dust hyposensitization being included in this regimen.

He was entirely free of symptoms until February, 1946, at which time his work necessitated his leaving the city. He was instructed to maintain treatment while away and was not seen again until June 8, 1946. At this time, he presented himself with full-blown symptoms of summer hay fever and the story that he had neglected to continue hyposensitization as instructed. Complete physical examination revealed a well-developed, white man with markedly boggy, pale, nasal mucosa, mild posterior pharyngeal wall edema, and bilateral conjunctival injection. Occasional, transient sibilant rales were heard

over both lung fields Blood pressure was 118/70 No other physical abnormalities were noted

Because there had been a four-month lapse since his last injection of pollen extract and because he presented himself during the height of the grass pollen season, it was decided to treat him symptomatically for the remainder of the season. Fifty-milligram benadryl "kapseals" were prescribed for him and he was instructed to take one that evening and to repeat at six-hour intervals if necessary. He was made to understand that the dosage varied with the individual case and that it would be best for him to take as few "kapseals" as possible to control his symptoms

At this Three days later, he was seen again time, he reported that his symptoms had entirely disappeared and that he had maintained himself in this symptom-free state on two "Lapseals" per day, one on arising and one in the late evening. His only complaint was a feeling of fatigue and weakness Physical examination on this day revealed a modern of the state of the sta ate, facial pallor, clear conjunctivae, marked reduction in nasal mucosal swelling, and a clear pharynx No abnormal physical signs were noted in the lung Blood pressure had fallen to 108/64 on refields peated readings He was elated at the success of the treatment but complained about the ease of fatigue and the fact that his eyes would stay open only with However, he continued about his business. He was asked to carry on his present regimen and to report back in three days

On the morning of the sixth day after inception of treatment (June 14, 1946), he was seen in his home in response to an emergency call from his wife. By this time, he had had a total dosage of 550 mg of benadryl. The only side-effects to date had been ease of fatigue and sleepiness.

The night before, he had taken a "kapseal" and gone to bed Early in the morning, he had awakened drenched in a cold sweat On opening his eyes, he had experienced an intense sensation of rotation around the long axis of his body, had become nauseated, and vomited He shut his eyes quickly and lay still Nausea and vertigo remained but vomiting abated Any motion or attempt to open his eyes resulted in intensification of the sense of rotation and vomiting In addition, he complained of a bilateral ringing in the ears that was constant and humming in quality Examination revealed a pale, only mildly edematous nasal mucosa, conjunctivae and pharyngeal wall were clear. There was a marked, rapid lateral nystagmus, cold clammy skin wet with perspiration, and generalized pallor Blood pressure had fallen to 90/60 on repeated readings and any attempts to change his position in bed met with retching and complaint of increasing ver-A diagnosis of acute labyrinthitis was made, benadryl was stopped and he was given an injection of ephedrine, 3/8 grain, and told to take the same dosage by mouth every two hours

The next morning the symptoms had abated only slightly He was still confined to bed, unable to move, opening his eyes only with the greatest caution Tinnitus, vertigo, and nystagmus were still present He was placed on a high protein, high potassium, salt-free, fluid restricted diet Ephedrine was stopped and 9 Gm. of ammonium chloride daily

was prescribed

On the third morning of labyrinthme symptoms, he was able to rise from bed and sit in a chair Now, however he dared not lie down since such change in position precipitated the entire complex of symptoms. Vertigo was not as marked, the nystagmus was still present but at a slower rate and he still complained of tinnitus. Blood pressure remained at 90/60 and pallor was beginning to

When on the sixth morning symptoms still main tained at this level it was decided to give him one more day of trial on the anticdema regimen and, then, perhaps attempt a spinal tap. He was seen on June 21 1946 seven days after inception of symptoms and cossation of benadryl There had been a moderate improvement in the past twenty four hours. He was able to walk about for a few moments without support. Nystagmus was gone almost entirely and the tinnitus had disappeared Spinal tap was not performed

Three days later June 24 1946, he returned to Labyrinthine symptoms had completely work. Now however, his hay fever came on in full measure and the allergic inflammation of the nose pharynx and conjunctivae reappeared. His blood pressure returned to 118/70 For about a week he was maintained with moderate symptoms by local therapy a nasal filter and vasoconstrictors by mouth.

On July 1 1046 however, he was desparate enough to agree to a trial of benadryl once more This time 20 mg. of the clixir (two tenspoonfuls) were given him on an empty stomach Within thirty minutes his nasal and conjunctival symp-Within toms abated his face became pallid and he vomited nausea, vertigo and tinnitus returned. His blood pressure fell to 00/60 He was placed on a cot and 0.8 cc. of adrenalin was administered every half hour for the next two hours. For the next four hours symptoms continued, gradually abating. Shaken but symptom-free he went home

Having gone this far he was prevailed upon to take benadryl a third and last time On July 28, 1946, during the free period between the grass and weed pollen seasons he was given approximately half the contents of a benadryl "kapseal in half a class of water Once more within thirty to forty minutes, labyrinthine symptoms appeared and followed a course entirely similar to that resulting from the elixir The total duration of symptoms this time was eight hours adrenalin again being

used in attempt to control them sooner

Comment

Before his experience with benadryl, this patient had never suffered from Ménière's disease or any symptoms that resembled it. Vertigo tinnitus, and nystagmus were strangers to him. Nausea and vomiting he had known as the result of occasional alcoholic or dietary indiscretions. His family history was entirely negative for this condition. There was no history of middle ear infection nor custachian tube involvement at any time. He had been in per fect health except for summer and fall hay fever for the past thirteen years, and mild perennial allergic coryga for the past year Followed to date there has been no recurrence of labyrinthme symptoms in any degree.

He was an atopic individual and showed multiple ingestant and inhalant sensitivity by skin test. Because of this and because he showed both cow hair and beef sensitivity it was suspected that the first onset of Ménière s disease might be due to the gela tin of the 'kapscals. (Gelatin is most commonly made from cow, lamb and hog hides) However this was clinically unlikely because he had taken gelatin in capsule form in the past and had suffered no ill effects. To rule out this possible allergen, the elixir was tried. When symptoms appeared follow ing the elixir it was realized that they might be on a basis of sensitivity to contents of the clixir and not the benadryl On this basis, the powdered benadryl of the "kapseal' was given the patient. When he reacted to this with the same symptoms, it was clinically evident that it was the benadryl itself which initiated the symptoms.

Although no definitive studies were made here such as direct skin test and passive transfer with the drug, it seems highly probable that the acute laby rinthine symptoms severe prolonged, and incapacitating, were due to hypersensitivity to benedryl itself

W.H.O FELLOWSHIPS FOR 1947 AWARDED

The Headquarters Office of the World Health Organization reported recently that 192 fellowships for the year 1947 have been awarded. Virtually all branches of medicine and public health are represented among the doctors and other health specialists selected to study at world centers under a \$1 500 000 grant from funds of the United Nations Relief and Rehabilitation Administration for field services.

An additional 200 fellows will continue this work under another grant for 1948.

Among the 1947 fellows, Poland is sending 54, China 42, and Yugoslavia 35.

SEVERE ANEMIA IN A CASE OF DIAPHRAGMATIC HERNIA

Aaron Cohen, M D, Wilfred Dorfman, M D, and Samuel Epstein, M D, Brooklyn, New York

(From the Medical Services of Dr Thomas J. Longo, Medical Director, Coney Island Hospital)

AMAN, P C, aged 64, was admitted to the medical service of the Coney Island Hospital on March 25, 1944, and was discharged on May 5, 1944. His chief complaint on admission was shortness of breath. The present illness began fifteen days before admission when he was seized with shortness of breath while climbing stairs. Thereafter, he noticed shortness of breath on moderate exertion. This seemed to be associated with indigestion.

His past history was essentially negative. There was no history of bleeding from the gastrointestinal tract, and no tarry stools. Physical examination revealed a marked pallor. His tongue showed no glossitis nor signs of abnormal smoothness. A loud, blowing systolic murmur was present at the apex. There was no evidence of cardiac enlarge-

ment The liver edge was palpable two fingers breadth below the right costal margin. His extremities showed a slight pitting edema bilaterally

Laboratory study showed a blood count of 3,150,000 with a hemoglobin of 46 per cent, the white blood count was normal. The Wassermann test was negative The stool was repeatedly negative for occult blood ova, and parasites. The gastric analysis showed normal values for free and total acidity. The urine was repeatedly negative and blood chemistry figures were within normal range. The electrocardiogram showed a slight, left axis deviation. A teleoroentgenographic study of the heart showed slight, left ventricular prominence, elongation of the aorta, and minimal pulmonary congestion. A gastrointestinal series reported moderate hermation of the cardiac end of the stomach through the esophageal orifice. The gastric tone was good, and the duodenum and small intestine were normal. In six hours the stomach was empty. A barium enema examination was

also normal Gastroscopy revealed an area at the lower end of the esophagus that was similar to a sphincter in its action. With each inspiration a marked constriction would occur, and relaxation would follow with expiration. As the patient adjusted to the manipulation of the instrument, the rapidity of this sphincteric-like action diminished. No local hemorrhages, ulcerations, nor congestion were observed.

The patient was placed on iron therapy with prompt hematologic response. He left the hospital and was advised to cut down on his physical work, so that the sphincteric-like action of the diaphram would be curtailed. Three to four months later he showed no anemia, with no new findings

Comment

This case is reported because no obvious reason for the anemia in highest hernia was evident. There was no achlorhy dria, no gross bleeding, nor evidence of a gastrointestinal lesion such as a peptic ulcer or malignancy to account for the anemia. There was no evidence of severe dietary deficiency, either in the history or in the physical examination anemia could not be accounted for by any impairment in digestion, such as would be present in dysentery, sprue, pellagra, or idiopathic steatorrhea There was also no evidence of hookworm infestation or Bothriocephalus latus, both of which can cause hypochromic anemia. It is possible, however, that the anemia can be explained in this instance by the nonabsorption of iron, since the function of the stomach in converting ferric iron to ferrous may be ın disorder At any rate, the addition of ferrous iron quickly relieves the anemic state.

CORRECTION

In the October 15, 1947, issue of the Journal, in an article on "Chronic Osteomyelitis in War Wounded A Report of Two Veterans Discharged with Intractable Osteomyelitis and Successfully Treated with Local Penicillin-Detergent Therapy," an error occurs on page 2205, in the last paragraph. The word "saucerization" should be substituted

for the word "cauterization" in the final sentence. The sentence correctly reads "It appears possible that the mutilating treatment of osteomyelitis by radical surgery and saucerization is outmoded and should be replaced by conservative procedures employing antibiotics, as in the method described in this report"

VOMITING FROM MULTIPLE CAUSES

BERNARD A. DUTFT M.D., Albany New York

(From the Gymecological Department of St. Peter's Hospital)

THERE is no mystery about the physiologic mechanism of vomiting It is well known that the act of vomiting is controlled by a center in the medulla and that this center is supplied by afferent impulses which may arise from any region of the body

Not slways so clearly understood, however are the precipitating causes, and the temptation to attribute uncontrolled vomiting to psychic or psychosomatic factors when a diagnosis is not readily apparent may prove too strong for the unwary It is for this reason that the present case is offered

Case Report

A 80-year-old married white woman of one-child sterility was seen in her home on December 8 1946, with a chief complaint of nausca vomiting, and generalized lower abdominal pain of two days duration. The condition was characterized by a sudden onset and by associated chills and fever The patient was in visible distress There were no

previous episodes

Significant findings of the initial examination were Temperature 103 F pulse 110 there was right there was right costovertebral tenderness, the abdomen showed right and last lower-quadrant tenderness. In the pelvic region there was marked bladder tenderness especially in the area of the trigone the cervix was bilaterally lacerated, the uterus was retroflexed, fixed in position and tender to all movement, and the admin were tender and palpable bilaterally. There was no abdominal distention palpation of the gallbladder was negative the uterus was of normal sue, and no significant enlargement of either adnexa could be felt.

The patient was admitted to the hospital the same day with tentative diagnosis of recurrent pelvic inflammatory disease and was treated with continuous Wangensteen suction, intravenous glucose, intravenous sulfadiazine and parenteral penicillin 100,000 units followed by 50,000 every three hours. Laboratory findings at this time were white blood cells 10,250 with 90 per cent polymorphonuclears, hemoglobin 77 per cent catheterized specimen of pur urine showed many red blood cells clumps of pur health are harm Zondek cells, and coarse granular casts Aschheim-Zondek test was negative gallbladder and gastrointestinal series were both negative.

Notwithstanding several remissions the patient improved gradually over a ten-day period, at the conclusion of which pelvic examination revealed a decrease in the bladder tenderness but persistent bilateral adnexal tenderness with a soft adherent mass on the left side, this mass was felt to be approxi-mately 8 cm. in its long axis.

Fourteen days after admission the patient was given a barium enema the x-ray findings were negative. Nevertheless, the patient again became nauseated and she vomited intermittently during the next four days. In the week following she im proved gradually and a polvic examination was repeated with findings which did not differ from those last described Accordingly a diagnosis of recurrent pelvic inflammatory disease with left tube-ovarian abscess was made and the patient was prepared for operation.

On January 2 a panhystero-left-salpingo-ovari-tomy was performed. The following facts were ectomy was performed revealed at operation The appendix had been removed in a previous operation. The uterus was slightly enlarged retroflexed, and adherent with numerous adhesions. The right tube presented evidence of mild salpinigitis and it was nonpatent the right overy showed no pathology The left tube was swollen and engorged and was firmly adherent by its imbriated end to the left ovary, the left ovary which measured 6.5 cm. in its long axis, appeared to be normal, although both tube and ovary were firmly adherent to the lateral pelvic wall,

Postoperatively the patient did very well, she was out of bed on the third day On the fifth day how over she again become nausented and began to vomit Examination now showed that her temperature was 08 F pulse 100 marked bladder tenderness and generalized tendernoss in the cul-de-sac with some brawny induration (a not infrequent finding follow-ing panhysteroctomy) A specimen of cathoterized urine contained clumps of pus cells and many red

blood cells.

Treatment at this point consisted of intravenous fluids Wangensteen suction streptomycin, and supportive measures. There was a gradual decline in the patient s general physical condition during the next ten days. Then, on the night of January 17 fifteen days after operation, while the patient was sleeping there was a considerable amount of serosanguinous vaginal discharge Pelvic examination revealed a rough friable, cauliflower-like area approximately 4 cm. in diameter in the left posterior fornix. A diagnosis of hematoma formation with necrous of the vaginal cuff was made.

The discharge disappeared gradually and the patient improved forthwith She was discharged from the hospital on the seventeenth postoperative

day

Summacy

A case of uncontrollable vomiting due to polvic pritation by several different agents is presented. The agents were (1) recurrent acute pelvic inflammatory disease (2) barium enema (3) poetoperative hematoms with necrosis of the vaginal

The author believes the causation of vomiting is reflex in nature, in the present case due primarily to pelvic irritation associated with a lowered threahold in the vomiting center

Program Planned for Research in Leprosy Treatment

HE Advisory Medical Board of the Leonard Wood Memorial and a group of consulting chemotherapists, nominated by the chairman of the Medical Board of the National Research Council, recently met in New York City for the purpose of planning a program for extensive research to find improved drugs or methods for treating leprosy

The meeting was probably the first at which a

large group of scientists, most of whom were not leprologists, has met to consider this health problem

from the strictly scientific viewpoint.

There was general approval of two plans establish a cooperative scheme with selected workers in various countries, under a central coordinating committee, whereby the new drugs now in use may be valued scientifically by uniform methods of procedure and recording Another is to establish, in connection with some suitable leprosy institution, a testing unit with special personnel to make preliminary tests of new drugs which appear to be of promise but which have not yet been used in the treatment of leprosy

Top Industrial Medical Authorities Named for NYU Board

PLANS for the operation of the recently maugurated Institute of Industrial Medicine of the Department of Preventive Medicine, New York University-Bellevue Medical Center, were furthered recently with the announcement that ten of the nation's top-ranking authorities in the field of industrial medicine have been named to its Medical

Advisory Committee
Dean Currier McEwen, of the New York University College of Medicine, announced that the following leaders had accepted appointments. Dr. J. M. Carlisle, medical director of Merck and Company Dr A. G Cranch, director, industrial toxicological department, Union Carbide and Carbon Corporation, Dr David H. Goldstein, medical director, New York Trines, Dr Willard Machle, New York industrial consultant, Dr M N Newquist, medical director, the Texas Company, Dr Robert Collier Page, general medical director, Standard

Oil Company (New Jersey), Dr Kenneth Peacock, chairman of the committee on industrial medicine of the New York County Medical Society, Dr Leo S Price, medical director, Union Health Center, Dr J J Wittmer, assistant vice-president, Con-solidated Edison Company, Inc, and W P Yant, vice-president in charge of research, Mine Safety

Appliance Company, Pittsburgh, Pennsylvania Dr Henry E Meleney, Hermann M Biggs professor of preventive medicine, New York University College of Medicine, is also a member of the committee, whose chairman is Dr Anthony J Lanza, director of the Institute The Institute was officially inaugurated last June as an integral part of the planned Medical Center Dean McEwen characterized the formation of the committee as another step in "assuring American industry that the new Institute will be dedicated to better health for more workers"

Diagnostic Units Set Up for New York City

FACILITIES for the diagnosis of virus and rickett-sial diseases are being organized for the Health Department by the Public Health Research Institute of the City of New York, Inc, it was announced in the annual report of the research in-

stitute by David M Heyman, president

Laboratories to diagnose virus diseases, which include a host of the most distressing modern ailments, have long been needed in the city, but their establishment has been delayed because of lack of facilities and trained personnel Dr George K. Hirst, chief of the division of infectious diseases of the institute, is now organizing and supervising the activities of the new laboratory service, and he will set the standards for adequate performance of tests, Mr Heyman added

The importance of the virus disease diagnostic service is indicated, the report said, by the fact that during the smallpox epidemic in April the institute was able to grow smallpox virus in chick embryos and thus confirmed the diagnosis of the disease in two or three days This was the first time the city had this service readily available

The research institute made further progress during the year in the development of a practicable method for evaluating the nutritive status of population groups by the use of what is called the "microchemical" method of analysis In a survey supported by the New York State Joint Legislative Committee on Nutrition, the feasibility of the "microchemical" method of analysis on a large group was demonstrated This survey showed that in one high school in the city 30 per cent of the girls had hemoglobin levels distinctly below those of a well-nourished group, he added
The Public Health Research Institute of the City

of New York, Inc, was established under Mayor Fiorello H. La Guardia in 1942 as a nonprofit corporation, to which the city contributes \$100,000

annually

Chronic Disease Program Outlined

MEETING in Chicago recently representatives for national welfare and modical groups recommended a program for aiding the 25,000,000 Americans who are reported to have chronic diseases. Sponsors of the program are the American Medical Association the American Public Welfare Association, the American Hospital Association and the American Public Health Association

The organizations said that of those persons with chronic diseases some 7 000 000 were partly or completely incapacitated and each year nearly

1 000 000 died from such illnesses.

The groups recommended the following program for all states and cities to broaden and coordinate

with Federal help

 Prevention Intensified health department programs to control chronic communicable diseases are called for Accident provention programs and health education of all kinds should be greatly expended."

- 2 Medical care "There is need for a new program which places major emphasis on the early stages of chronic illness. This requires construction of hospital and laboratory facilities to cover all our communities."
- Rehabilitation "Occupational retraining and job placement are essential therapeutic and preventive measures
- 4 Research 'Further advances in provention as well as treatment of many chronic diseases depend on research "

The association said that in eight states and four cities action to meet the problem "already has been taken or is in the planning stage." The states are California, Connecticut Illinois, Indiana, Maryland, Massachusetts, New Jersey, and New York. Cities listed were Chicago Cleveland, Milwaukee, and New York.

MEETINGS

PAST

American College of Physicians, Western New York Region

Dr Hugh J Morgan, Nashville Tennessee, president of the American College of Physicians, spoke at the regional meeting of Western New York members on October 23 at the Onondaga Country

Club Syracuse.

Speakers at the morning and afternoon sessions included Dr Herbert R. Brown, Rochester, Dr Allan D Bass, Syracuse, Dr Simon Propp Albany, Dr George H. Relienstein Syracuse Dr Eugene L. Louner Syracuse Dr Charles G Craddock, Jr. Rochester, Dr Roger 8 Mitchell, Trudeau, Dr James Monroe Ray Brook Dr Richard H Lyons Syracuse Dr John N Hayes, Saranac Lake Dr Paul Bunn, Syracuse University Dr John H. Talbot, Buffalo Dr J. Howard Forguson, Syracuse Dr George M. Mackensie Albany and Dr Ronald L. Hamilton, Binghamton.

New York Council of Surgeons

Two loctures were held recently at the Parkcharter General Hospital, New York City, sponsored by the New York Council of Surgeons. On November 25 Dr Lester J Unger director of the blood and plasma division of New York Post-Graduato Medical School and Hospital, disoussed "Recent Advances in the Rh Factor and Its Practical Application," and on December 2, Dr Henry Mates associate surgeon at Harlom Eye and Ear Hospital, spoke on "The Diagnosis and Treatment of Eye Diseases of Interest to the General Practitions."

Saranac Lake Medical Society

Dr A J Vorwald spoke on "Medical Problems Concerning Industrial Uses of Beryllium at a mosting of the Saranac Lake Medical Society held on December 3 at the Saranac Laboratory

Eastern New York Eye Ear Nose and Throat Association

Members of the association were guest speakers at the scientific session of the Eastern New York Eye, Ear Nose and Throat Association, held on December 3 at the University Club Albany Drohn A. Cetner presented a paper on "The Newer Implants Employed in Enucleation, and Dr Benjamin M Volk gave a 'Discussion of Ludwig's Angina.'

FUTURE

Council on Medical Service American Medical Association

The Midwest Regional Conference of the Council can Medical Service of the A.M.A. will be held January 4 at Cleveland, Ohio, prior to the opening of the interim section of the A.M.A.

National Conference of County Medical Society Officers

The Grass Roots Conference of the National Conference of County Medical Society Officers will

be hold January 6 at Cleveland, Ohio with a stated purpose to develop a working partnership between the A.M A. and every physician.

Subjects to be discussed include "The General Practitioner—How to Create More of Him for the Future Need of the Country' Upholding the Prestige of the General Practitioner, and "The General Practitioner and Community Leadership

Mount Sinal Hospital

A series of lectures on "Recent Advances in Surgery" is being held on Wednesday evenings at

Mount Sinai Hospital, New York City, to which all interested are invited

Future sessions, with lecturers and their subjects.

January 7—Dr G Glen Spurling, clinical professor of surgery, University of Louisville, School of Medicine, Louisville, Kentucky, "Lumbar Intervertebral Disk Lesions", January 21—Dr Oliver Cope, assistant professor of surgery, Department of Surgery, Harvard Medical School, Boston, Massa-chusetts, "The Treatment of Hyperthyroidism in Transition from Surgical to Medical", February 11
—Drs James W Watts and Walter Freeman,
George Washington University, Washington, D.C., "Pain and Disability'

March 3—Dr Charles B Huggins, professor of urological surgery, University of Chicago, Chicago, Illinois, "The Diagnosis of Disease by Enzymatic Methods", March 17—Dr Robert Elman, associate professor of surgery, Washington University, St Louis, Missouri, "Protein Needs in Surgery", April 7—Dr Allen O Whipple, professor of surgery, Columbia University, April 21—Dr Robert E

Gross, Children's Hospital, Boston, Massachusetts. "Surgery in the Early Months of Lafe"

Postgraduate medical courses to be conducted at Mount Sinai Hospital in 1948 have been announced. These include a Symposium in Medicine, from February 2 to April 3, in cardiovascular diseases, gastrointestinal diseases, diseases of the liver, kidney, chest, allergy, diseases of metabolism, endocrinological diseases, venereal and skin diseases, and hematology

Individual courses, varying in length, from January 5 to May 22, will be given in elementary and advanced electrocardiography, genatures, gynecology, bedside clinics in heart diseases, recent advances in neurology and psychiatry, psychiatry in general medicine, surgical pathology, clinical pediatrics, physiology, surgery of the gastrointestinal tract, and symposium in ophthalmology

For further information address the Registrar for Medical Instruction, Mount Sinai Hospital, Fifth Avenue and 100th Street, New York 29, New York.

PERSONALITIES

Honored.—Dr Raymond S Megibow, of Mount Sinai Hospital, Dr Doris J W Escher, Montefiore Hospital, and Dr Roslyn Wiener, New York Hospital, who were awarded the three fellowships granted by the Rosenstock Memorial Foundation, Inc., Long Island City, a philanthropic foundation for the purpose of fostering individual medical research without regard to race, color, creed, or sex.

Appointed.—Dr Donald A. Covalt, former chief, Veterans Administration Physical Medicine Rehabilitation Service, as associate professor of physical medicine and rehabilitation at the New York University School of Medicine and head of the University's new Rehabilitation Institute A. Ray Dawson, former head of the physical medicine rehabilitation service in the Richmond, Virginia, branch office, to succeed Dr Covalt Dr Harry S Mustard, as New York City Health Commissioner, replacing Dr Israel Weinstein, resigned Dr William F White, Buffalo, formerly acting surgeon for the Buffalo Fire Department, as head of the list for surgeon approved by the Civil Service Commission

Elected -Dr N Stanley Lincoln, superintendent of Biggs Memorial Hospital, Ithaca, as president of the New York State Association of Superintendents and Managers of Tuberculosis Sanatoria.

Speakers -Dr Jean A. Curran, president of the Long Island College of Medicine, at a meeting of the Brooklyn Rotary Club, on the need for additional health and medical resources for the people of Brooklyn Dr Alan Gregg, director of medical sciences of the Rockefeller Foundation, at the annual luncheon of the National Committee for Mental Hygiene in New York City, urging cooperation of laymen and professional men in a countrywide mental health program Dr George Pack, attending surgeon, Memorial Hospital for Cancer and Allied Diseases, and clinical professor of surgery, New York Medical College, a lecture on "The Definition of Inoperability of Cancer" at the

annual meeting of the Southern Medical Association in Baltimore, Maryland, on November 25, and two lectures on "Diagnosis and Treatment of Pigmented Nevi and Melanomas" and "Manage-ment of Malignant Tumors of the Soft Tissues" at a cancer seminar held under the direction of the Tumor Clinic, Duval County Hospital, Jacksonville, Florida, on November 14 Dr Joseph I Pascal, New York City, who has been invited to read a paper on "A Graphic Study of the Ocular Muscles" at the Congress of the Pan-American Association of Ophthalmology to be held at the Medical School of the University of Havana, January 4 to 11 Dr Edwin Ramsdell, chief of staff of the White Plains Hospital, at a meeting of disaster chairmen of the Westchester County Red Cross Dr Ralph Sheldon, Lyons town and school health officer, on "Great Men of Medicine" at a meeting of the University Extension Circle, in Lyons Dr S Burt Wolbach, director of nutritional research, Children's Hospital, Boston, who gave the fourteenth Walter M Brickner Lecture at the Hospital for Joint Diseases, New York City, on December 16, on "Skeletal Reflections of Vitamin Deficiencies and Excesses"

New Offices —Dr Charles H. Cole, general practice in Cambridge Dr Wade A. Hastings, veteran of four years' service with the US Army Medical Corps in the Pacific theater, general practice in North Bangor Dr Nicholas Linderman, Army veteran, formerly assistant in the department of anatomy at the University of Buffalo, general practice in Byron Dr Allen Walter Henderson, Syracuse, former lieutenant commander in the US Navy, practice of anesthesia in Watertown Dr Edward J Matthews, Army veteran of the European theater where he was stationed with the First Auxiliary Surgical Group, practice of medicine and surgery in Tottenville, Staten Island Dr J William Milhauser, Brooklyn, general practice of medicine, Hicksville Dr Selden T Williams, Jr, general practice in Attica.

COUNTY NEWS

Albany County

At the annual meeting of the Albany County Medical Society on December 10 election of officers for the coming year was held with a slate submitted by the nominating committee. Six new members were also elected, and reports of officers and committees were heard

Personal experiences in his home country, the Netherlands, at the time of the Nazi invasion were described by Dr A. M. Meerloo of New York City in a lecture at the November meeting of the Albany Society for the Advancement of Psychosomatic Medicine. His subject was "General Implications of Fear in War and Peacetime." Dr Robert R. Faust, precident of the Society was chairman of the meeting.

Bronx County

Dr William Dock spoke on "The Background of Arteriosclerosis" at the November meeting of the Bronx County Medical Society held at the Concourse Plaza Hotel. Discussion of his talk was led by Drs. David Greenberg, Blase Pasquarelli, and Max Weiss.

Members of the Bronx County Society are urged to write their opinions of various topics, to aid the Public Relations Commuttee in its investigation of subjects, which include the Veterans Administration, health insurance plan, fees and the cost of living, a national health program, and the future of medicine.

At a meeting of the Bronx Gynecological and obstetrical Society on November 24 a scientific program which included four lectures was presented. Speakers and thour subjects were Dr L. Caruso "Unusual Neoplasm in a Young Child' Dr J Smoley, "Lymphogranuloma Venenum Complicating Pregnancy" Dr M. J Goodfrend, 'Pregnancy Subsequent to Lymphosarcoma and Dr M. Gottlieb "Suprapuble Extraperitoneal Repair of a Vesicocervical Firstula,'

Dr H. Houston Merritt spoke on Recent Advances in the Therapy of Epilepsy at the November meeting of the Bronx Society of Neurol op and Psychiatry held at the Monteflore Hospital auditorium.

Cattaraugus County

Honoring doctors who had practiced fifty years or more members of the Cattaraques County Medical Boclety held a dinner and meeting November 20 at Salamanca. Members of the Woman & Auxiliary members of the group for the dinner with sixty members of the combined organizations present.

Guests of honor were Dr. and Mrs. A. C. Greecheaf Olean, Dr. P. H. Bourne, Salamanca Dr. and Mrs. Thomas Loughlen, Olean, Dr. J. A. Taggert, Salamanca and Dr. A. W. Smallman and daughter Miss Doris Smallman, Ellicotville

Chenango County

Dr Robert F Korns, assistant director of the Division of Communicable Diseases New York State Department of Health spoke on pollomyelitis at the annual meeting of the Chenango County Medical Society held on Docember 9 at Norwich. The instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, in cooperation with the State Health Department.

Erie County

The annual meeting of the Eric County Medical Society was held December 18 at the Hotel Statler Buffalo at which new officers were elected

At its meeting on October 28 at the Hotel Statler the Eric County Society had an afternoon and even ng clinical program with speakers and their topics including Dr. Frank II. Lahey, "Present Concepts in the Surgical Treatment of Peptic Ulcer", Dr. Sidney Farber "Treatment of Cancer in Children and Dr. Louis M. Hellman, "Use of Pitultrin in Obstetrics"

Drs. Rocco N De Dominicis and Milton J Schuls Eric County medical examiners, recently completed a week's refresher course at Harvard University's basic seminar in legal medicine.

Herkimer County

Members of the Herkimer County Medical Society have adopted a resolution calling for an increase of fees commensurate with 'a marked increase in the cost of living as well as in the costs incident to the practice of medicine New and old fees are office call, \$3 (previously \$2), house call \$4 (previously \$3) house call received after 9 r m., \$5 (previously \$4)

Jefferson County

'A Review of Recent Studies Regarding Maternal and Infant Mortality' was the topic of the postgraduate instruction presented by Dr Merton C Hatch, associate professor of clinical obstetries Syracuse University College of Medicine, and Dr Tyree C Wyatt, associate professor of clinical pediatries at the same university at a meeting of the Jefferson County Medical Society on December 11 in Watertown

The instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York

Monroe County

A message to Governor Dewey and State legislators urging appointment of a commission to study the problems of alcoholism was eart by the Monroe County Medical Society at its October meeting in Rochester Annual election of officers was scheduled for the December session.

Dr Ovid Pearson, a member of the County So-

ciety has prepared a report on eye accidents to children up to 18 years of age covering the five-year period from 1941 to 1946 in Monroe County Dr Clarence R Pearson, representing the Monroe County Medical Society, was one of the speakers at the Alcoholism Institute sponsored by the Rochester Committee for Education on Alcoholism on October 19

At the meeting of the Monroe County Mental Hygiene Society on November 5 in Rochester, Dr Howard Hanson, director of the Eastman School of Music, spoke on "The Emotional Aspects of Music"

Nassau County

Demanding immediate and decisive action on the issue, members of the Nassau County Medical Society, at their meeting on October 28, adopted a resolution disapproving the management and operation of the Health Insurance Plan

The resolution, presented after lengthy discussion at the meeting, attended by almost 150 members, requested all members not to participate in the plan and asked all those now participating in it to sever their relationship as quickly as

possible

A series of Tuesday afternoon postgraduate instruction lectures were arranged for the Nassau County Medical Society during December at the

Nassau Hospital, Mineola

The series included November 25—"Gynecology in General Practice," Dr R Gordon Douglas, formerly associate professor of clinical obstetrics and gynecology, Cornell University Medical College, December 2—"Common Parasitic Infections That Are Encountered in General Practice," Dr John Emmett, instructor in preventive medicine and public health, Cornell University Medical College, December 9—"Dietetic Management of Diabetes," Dr George E Anderson, clinical professor of medicine, Long Island College of Medicine, and December 16—"Peripheral Vascular Aspects of Arteriosclerosis and Aging," Dr A. Wilbur Duryee, attending physician and chief of peripheral vascular clinic, New York Post-Graduate Hospital

The instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, in cooperation with the State Department of Health

New York County

At the meeting of the New York County Medical Society on October 27 at the New York Academy of Medicine, Dr Harold B Davidson, president of the Society, gave his maugural address. He maintained that the country's need for greater and better medical care should be solved on a local or state level and should not be enlarged to a national scale, and spoke against the Wagner-Murray-Dingell bill, saying that it failed to make provision for the indigent and added a huge tax burden to supply medical care "efficiently given at the present time to people financing their own care"

Onondaga County

Annual election of officers was held at the meeting of the Onondaga County Medical Society on December 2 at the Hotel Syracuse, Syracuse "Recent Advances in Gastrointestinal Surgery" will be the topic of postgraduate instruction to be presented by Dr John H Garlock, clinical professor of surgery at the College of Physicians and Surgeons, Columbia University, at the meeting of the Onondaga County Medical Society on January 6 at the University Club, Syracuse

Orange County

Psychosomatic medicine was discussed by Dr George E Daniels at the meeting of the Orange County Medical Society on October 14 at Goshen.

The Society's cancer committee, headed by Dr H M Gasparian of Cornwall, announced that public cancer education meetings had been arranged and held in almost all Orange County communities during the past six months

Oswego County

Dr David Goldblatt, associate clinical professor of surgery at the New York Post-Graduate Medical School, spoke on "The Treatment of Burns' and Hand Infections" at the meeting of the Oswego County Medical Society on November 18 in Fulton

The postgraduate instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York for

the County Society

Queens County

Queens County physicians participated in a discussion program on November 3 at the Horace Harding Hospital, Elmhurst, on the subjects of thrombo-embolic disease and carbon tetrachloride poisoning

Participating were Drs James R. Reuling, Bayside, W Howard Barber, Richmond Hill, Arthur A. Fischl, Long Island City, Edward A. Flemming, Forest Hills, Alfred Angrist, Jamaica, and Louis J Taormina, Elmhurst

. . .

"Rocky Mountain Spotted Fever on Long Island" was the subject of a talk by Dr John K Miller, associate director, Division of Laboratories and Research, State Department of Health, at the scientific meeting of the Queens Pediatric Society held December 1 at Forest Hills

Rensselaer County

On December 11, members of the Rensselaer County Medical Society held their annual dinner meeting and industrial health teaching day in Troy, under the auspices of the County Society, the State Society, and the State Department of Health.

Chairman of the afternoon session was Dr William T Shields, Jr, and opening remarks were presented by Dr Clement J Hendron, vice-

president of the County Society

Speakers included Dr Samuel Kahn, compensation medical examiner of the State Workmen's Compensation Board, on "The Relation of Trauma to Disease", Dr Jesse Tolmach, also on the State Board, on "The Evaluation of Disability", and Dr Joseph L Morse, associate in dermatology and syphilology, New York Post-Graduate Medical School, on "Industrial Dermatoses"

At the evening session, Dr Sherman W Mc-Ilmoyl acted as chairman Dr Paul Reznikoff, professor of clinical medicine, Cornell University Medical College, spoke on "Blood Dyscrasia Produced by Industrial Exposures"

[Continued on page 98]

HOSPITAL NEWS

Training Programs to Improve Hospitals Standings

WiTH more facilities for the teaching and training of doctors, hospitals, aided by the community, can onlarge vital medical services and improve the position of New York among major cities as a medical center according to a recent bulletin of the Hospital Council of Greater New

Hospital beds and clinic material, essential to residency training, were shown in an analysis by the Council to be dissipated in too many small hospitals where such training is not possible. The need for expansion of hospital facilities offers an opportunity to the hospitals and the community for coordinated effort to develop those facilities so that dectors in the various specialties may be trained in proportion

to the needs of the people.

The Council's published 'Master Plan for Hospitals and Related Facilities for New York City' provides for facilities which would make possible residency training programs in all three types of proposed general hospitals—community regional, and central. The community hospital smallest of the three types, is not less than 200 beds. The extent of residency training programs in these proposed hospitals would vary according to the number and concentrations of the various types of clinic material in the different specialties, the Bulletin said

In spite of the fact that hospitals in New York outnumber those in any other of the nine major U.S cities studied the Council s analysis showed that New York is below five of the cities, Los Angeles Cleveland Baltimore St. Louis, and Boston in the percentage of registered hospitals with 200 or more beds. In percentage of hospitals with residency training programs in general medicine and general surgery in these nine cities, the only city lower than New York is the city of Detroit

NEWS NOTES

The Jewish Sanitarium and Hospital for Chronic Discusses of Brooklyn is creeting a new building to provide for an additional 350 beds. Caring for 550 patients daily now the hospital expects its new structure to be available for occupancy in about one year Last year 183 923 free hospital days were made available, according to Isaac Albert, presentage. president.

The Veterans Speech Clinic of Polyclinic Hospital, New York City has resumed its activities in treating veterans with disorders of speech, voice, and hearing.

A new hospital building and laboratory has been planned by the Chenango County Medical Society in cooperation with County authorities, according to an announcement by Dr John A. Hollis, Society chairman. Provision is to be made for 40 or 50 beds in the new building, and another hospital to house 30 beds, is to be erected in the southern part of Chenango County

Corning Hospital was visited by more than 200 area residents at the hospital's second annual "Open House in October Members of the board and the hospital staff served as hosts, and tours of inspection, guided by representatives of the various hospital chapters, were conducted throughout the afternoon.

Plans have been completed for a permanent hospital building for Massena, according to a recent announcement, to replace the present temporary hospital Unlike the temporary hospital the new building will contain private rooms as well as wards.

The Hospital, Sidney has been approved by the Associated Hospital Service of New York as a member hospital under the Blue Cross Hospital Care Plan.

In cooperation with the Peckskill Lions' Club the board of directors of Peckskill Hospital has established an eye clinic for residents of the city and its surrounding area. Operating on Saturday morn-ings, the clinic will be stalled by doctors of the hospital, who will be assisted in clerical work by Lions' Club members.

The Medical Group offering comprehensive year-around medical care for wage carner groups, has been opened at the New York University College of Medicine. Organized by the University's faculty the unit is an outgrowth of the University Clinic, which was formed in 1883 It will occupy quarters at the College of Modicine which have been redecorated and equipped at a cost of more than \$150,000

Speakers at the opening ceremonies of the unit were Dr George Bashr president of the New York Academy of Modicine Dr Harold B David-son, president of the New York County Medical Society Dr Marshall S. Brown, Jr., director of the Medical Group and Sir Raphael Cliento director of social activities of the United Nations Secretariat.

According to a survey in the 1947 edition of the American Hospital Directory, published by the American Hospital Association, 16 675,602 patients were admitted to 6,125 hospitals in addition to 88,000 000 visits in 1946 by outpatients to clinics. Hospital plants were valued at \$4,400 000 000 or approximately \$3 100 per bed an increase of \$180 000 000 over hospital valuation in 1945.

A comprehensive study of the type of hospital Lake Placid needs in the future has been made by Dr Bartholomew Ring, chairman of the Lake Placid Hospital Board The minimum estimate of Placid Hospital Board the size of the hospital is fifty beds, but Dr Ring also called for a wing of twenty-five more beds to care for the resort population of Lake Placid. The present hospital, Dr Ring reported, accommodated 450 patients last year but could not receive 250 more applicants who were forced to seek care else-

Five doctors at St John's Hospital, Brooklyn, under the direction of Dr Merrill M Foote, chief of surgery, coordinated the work in their special fields several months ago for the purpose of estab-lishing a tumor clinic Patterned after the clinic at Memorial Hospital, the St John's tumor clinic is held each Wednesday morning

A vital need for public education to make com-munities "hospital conscious" was sounded at a panel discussion of the Northern New York Hospital Council held recently at the Physicians Hospital, Plattsburg The meeting was attended by representatives of Plattsburg, Malone, Saranac Lake, Tupper Lake, Potsdam, Gouverneur, and Massena hospitals.

A seminar on the Progress of Physical Medicine was held in December at Polyclinic Medical School and Hospital, New York City, with Dr Winfred Overholser, superintendent of St Elizabeth's Hospital, Washington, D.C., as guest speaker Dr Richard Kovacs, director of physical medicine at Polyclinic Hospital, presided More than 100 physicians and physical therapists attended the

Plans are underway for the expansion of Oswego Hospital, according to a recent announcement Two new wings are to be added to the present structure, which also is to be modernized and fire-proofed

Plans for reorganizing and expanding Sydenham Hospital in Harlem, New York City, into an institution combining medical practice with a social approach to community health were announced recently by hospital officials Dr Alfred E. Cohn, author of the plan and member of the hospital's board, said that the hospital will undertake a fourfold program "continued basic hospital service, research and teaching, community exploration for social and medical facts affecting health and welfare, and the publication of a quarterly journal to acquaint the nation, in popular language, with the hospital's findings

PERSONALITIES

Appointed.—Dr Madison B Brown, assistant director of Roosevelt Hospital, New York City, as first assistant director of Johns Hopkins Hospital, Baltimore

REVIEWED

The 1946 Year Book of General Medicine Edited by George G Dick, M D, J Burns Amberson, M. D, George R. Minot, M D et al Duodeelmo of 772 pages illustrated. Chicago Year Book Publishers 1946 Cloth, \$3.75

As always the 1 car Book of Medicine contains ex tremely interesting and frequently useful information. As usual it is difficult to pick out the most striking reviews Those on kidney diseases and cardiology are especially good. This volume in cludes a well-deserved tribute to the late Sir Thomas Lewis. This volume, as those of other years should be on every medical man's shelf.

ANDREW BABEY

X-Ray Diffraction Studies in Biology and Medicina. By Mona Spiegel-Adolf, M.D. and George C Henny M.D. Octavo of 215 pages, illustrated New York, Grune & Stratton, 1947 Cloth \$5.50

The atom has become more than just a byword of our postwar existence It not only enters into the science of physics and chemistry but into our body politics and now actually into the province of biology and medicine.

As long ago as 1912, crystals were shown to constitute a three-dimensional diffraction pattern to the x-ray beam. More recently by these diffraction studies it has been shown that silk fiber, living nerve, and muscle are also composed of a regular pattern arrangement of their atoms and molecules In fact, an amorphous structural setup among molecules is a rare occurrence in nature

The theory of x ray diffraction is clearly presented with but few mathematic formulas to confuse the untrained reader The apparatus used by the authors is described adequately and is well illustrated. The book serves as an excellent introduction to the study of the exact interarrangement of the molecular and atomic particles in matter
WILLIAM E HOWES

Psychiatric Interviews with Children. Edited by Helen Leland Witmer Quarto of 443 pages New York, Commonwealth Fund, 1946 Cloth, \$4.50

This Commonwealth Fund publication is a re-cording of the psychiatric management of 10 children in various child guidance clinics. Each coding of the psychiatric management of a children in various child guidance clinics. Each contributor has attempted to show how a satisfac-tory colution was reached through the use of par-ticular technics, and the reasons therefor. This book will be of particular interest to students of Daybothesan in abilities and to practitionars of psychotherapy in children and to practitioners of child psychiatry STANLEY S LAND

Handbook of Physiology & Biochemistry milly "Kirk's" and later "Halliburton"s." By R. J. 8 McDowall, M.D. Thirty ninth edition. Large duodecimo of 808 pages illustrated Phila-delphia, Blakiston Company 1946 Cloth, 87 00

This book on the physiclogy and chemistry of the human book on the physiciogy and unchanged the human body has been brought up to date by revision of the previous edition. New additions have been made to the chapters deeling with metabolism osmotic activity the effects of high altitude rickets and myxedema. The interglandular relationships tionships especially the pituitary and adrenals are vividly presented. The structure and function of the cerebrospinal system, including cerebellar localisation, are well described The text is profusely illustrated and well printed

EDWARD II NIDISH

Allergy in Theory and Practice By Robert A Cooke, M D In association with Horses S Bald win, M D Robert Chobot M D R. Clark Grove M D et al Octavo of 572 pages, illustrated Philadelphia W B Saunders Company 1947 W B Saunders Company 1947 Cloth, \$8 00

This volume is the ultimate outcome of several programs of postgraduate instruction in allergy directed by the author Thirteen of the thirty three chapters were written by Dr Cooke The book will prove to be interesting reading and also provide valuable important and appelalist in allergy
MAX HARTEN provide valuable information to the student, general

Synopsis of Operative Surgery By H. E. Mobley, M.D. Second edition Duodecimo of 416 pages illustrated. St. Louis C V Mosby Company 1947 Cloth, \$6 00

This second edition is notable for its comprehen sive presentation of the many types of operation that the general surgeon is called upon to perform The technic of the standard operations is adequately albeit concisely described and clarified by abundant illustrations many of which are in colors The book is very readable and contains a wealth of practical information in clear and condensed form. It should prove helpful both to the prospective young resident and the older practicing surgeon

Автиив Состаси

Experiences with Folic Acid. By Tom D Spies M.D Octavo of 110 pages illustrated. Chicago Year Book Publishers 1947 Cloth \$3.75

This book is an extremely enthusiastic review of the role of folic said in macrocytic anomia. Whether this enthusiasm will continue and whether it is warranted will be shown by further clinical experi ence. The use of folic acid for producing blood regeneration in persons with Addisonian pernicious anemia, nutritional macrocytic anemia, and its use in macrocytic anemia of sprue pregnancy and pellagra is described.

As a book full of enthusiasm combined with a pleasant presentation of knowledge it is recommended reading for the clinician.

HENRY M FEINBLATT

Practical Physiological Chemistry By Philip B Hawk, Ph.D Bernard L. Oser, Ph.D and William H. Summerson, Ph.D. Twelfth edition. Octave of 1.823 pages, illustrated. Philadelphia, Blakiston Company 1047 \$10

Hawk s book in all its forty years of authoritative existence, never before has had a decade elapse be-tween editions. New and transitional blochemical alterations of this active period have necessitated an over-all revision with extensive additions totaling to a new volume 30 per cent larger than the previous edition. Obsolete methods have been deleted and new procedures admitted, particularly for blood and urine analysis. Integration of the older and recent phases has been admirably accomplished The book is up to date, wonderfully edited, printed on excellent paper, and is attractively bound. Its distinguished history of usefulness as text and reference work is enhanced by the present edition

IRVING M DERBY

Annual Reprint of the Reports of the Council on Pharmacy and Chemistry of the American Medical Association for 1946 135 pages Chicago, American Medical Association, 1947 Cloth, \$1 00

This volume was formerly of most interest to those who wished to know why the Council on Pharmacy and Chemistry had not accepted certain of the preparations it had considered. The reports were mainly those of rejection, though, through the years, the educational nature of the Council's work was attested by status reports on drugs, or therapeutic procedures, or preliminary reports on agents showing promise of usefulness but not yet ready for adoption by the general and medical profession In adoption by the general and medical profession recent years, the tendency has been toward a preponderance of the educational type of report the present volume, both the condemnatory and the educational phases of the Council's work are represented

There are three reports of vigorous condemnafirst, the report on cabasil, a curiously unscientific mixture whose exploitation for use in a multitude of diseases is aptly summarized by the subtitle of the report, "Quackery Unlimited", second, the report on the pseudoscientific Ethylene Disulphonate (Allergosil brand), a preparation of highly uncertain nature exploited by physicians for use in allergic conditions, third, Formula A-N-1, a joint report of the Council on Pharmacy and Chemistry and the Council on Industrial Health, concerning an expensive but poor substitute for aspirin and citrate of magnesia, cleverly promoted to industrial concerns for use in reducing absenteeism due to colds

Among the status reports, the excellent article of Dr Samuel M Feinberg, "Histamine and Antihistaminic Agents," is probably most worthy of Since its appearance, the Council has accepted for inclusion in New and Nonofficial Remedies, the two new agents of this class evaluated in the article, Diphenhydramine Hydrochloride, and Tripelennamine Hydrochloride (Benadryl Hydrochloride and Pyribenzamine Hydrochloride, respectively)

Pharmaceutic and scientific investigators, alike, will be interested in the informative report on the Council's new Therapeutic Trials Committee special interest to manufacturers is a statement on the revised rules of the Council, though this exposition of the trends of Council policy is of concern to all who are interested in progressive rational

therapeutics

Attention is called to the several reports on the adoption of generic designations for drugs proposed or marketed under protected names Not all such actions of the Council have been the subject of separate published reports, the recognized terms have appeared in the published descriptions of the drugs when accepted, and will be inserted in another Council publication, New and Nonofficial Reme-dies, as adoption of such designations for already accepted protected names proceeds

New and Nonofficial Remedies, 1947, Containing Descriptions of the Articles which stand accepted by the Council on Pharmacy and Chemistry of the American Medical Association on January 1, 1947 749 pages Philadelphia, J B Lippincott Company, 1947 Cloth, \$3 00

Although the latest edition of New and Nonofficial Remedies has some 11 pages fewer than the 1946 book, its increase in size, due to the heavier paper used, and its change of color—dark green to bright red—combine to make a striking contrast with The book is now pubthe earlier annual volumes lished by J B Lippincott Company, though it is still issued under the direction and supervision of the Council on Pharmacy and Chemistry innovation is the relegation of the statements of tests and standards to the back of the book, which makes the text more convenient and usable for the physician, for whom it is primarily intended understood that supplements to the annual volumes no longer will be issued The physician who is interested in current acceptances can keep track of these as the descriptions are published in the Journal of the A M A, or may inquire about them by addressing the Council's office at A M A headquar-Several medical and pharmaceutic journals now carry lists of currently accepted products

There appears to be no very extensive revision in the various general articles or chapter-head discussions, although several new monographs have made their appearance and others have been revised to reflect current medical opinion. One notes the appearance of a new chapter, "Unclassified Therapeutic Agents," which includes the mono-graphs on Gold Compounds and Iodine Compounds for systemic use This is in line with the policy adopted some years ago of classifying accepted preparations according to pharmacologic action and

therapeutic use

Attention is called to the amplification and indexing of the section devoted to the statement of the Council's rules This should be of great assistance to manufacturers in the presentation of products for Council consideration and is no doubt inspired by the recent marked increase in the number of pharma-

ceutic concerns asking Council recognition The descriptions of some thirteen new preparations appear in this volume. This excludes, of course, brands or dosages of already accepted Among those preparations noteworthy of mention are the pertussis vaccines and vaccines representing combinations of pertussis with diphtheria and tetanus organisms, the new histamine-antagonizing agent, Benadryl Hydrochloride Elixir (Diphenhydramine Hydrochloride Elixir), Furacin (Nitrofurazone) a new topical anti-infective agent, Streptomycin, Heparin Sodium, Parenamine, a new casem hydrolyzate, Thiouracil, an antithyroid agent, Naphuride Sodium (Suramin Sodium) a new trypanocide, and tuamine (Racemic 2-aminoheptane), a new vasocontrictor One notes the increasing appearance of generic designations in conformance with the revised Council's rules on acceptance of agents bearing protected or trade-marked names

New and Nonofficial Remedies remains a most valuable and authoritative compendium of modern rational therapeutics With successive editions, it becomes more useful and accessible to the physician and to all those interested in the use, preparation, or

manufacture of drugs

the ABC

of Penicillin Administration

Just place the Bristol Cartridge of Penicillin in Oil and Wax in either of two specially designed cartridge syringes,

Insert the needle into the muscle and test for venipuncture by means of the ingenious aspirating device

Reverse the cartridge and INJECT You have now provided adequate therapeutic blood levels of penicillin for 24 hours

Bristol Penicillin Cartridges contain 300,000 units (1 cc) of crystalline sodium penicillin G in oil and wax (Romansky Formula) They are intended for use with either of two special syringes the B D* Disposable Cartridge Syringe which is presterilized and discarded after use, and the B-D* Metal Cartridge Syringe which can be cleaned and sterilized for re use in a matter of minutes

SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE JOURNAL OF MEDICINE

The New York State Journal of Medicine asks its contributors to follow the suggestions listed below in the preparation of their articles. In this way they will greatly facilitate the expeditious publication of the Journal. These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles —It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside Longer articles tend to lower reader interest. An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e.g., twelve manuscript pages will make five JOURNAL pages

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins. They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers.

Titles.—The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters. Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives. Directly under his name should be the hospital or institution with which he is affiliated.

Subheadings.—Subheadings should be inserted by the author at appropriate intervals

References—It is the unfaling practice of the New York State Journal of Medicine to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text). The arrangement should be as follows and should include all items.

Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed., Philadelphia, Lea & Febiger, 1927, vol. 5, p. 57

b Periodicals—author's surname followed by

initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

Note The Journal does not include titles of articles

Case Reports —Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables —While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be reduced as much as possible to descriptive language.

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author. In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the not

inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India Do not use typewriter for letterink on white paper The smallest lettering on 8 × 10 inch copy should be no less than 1/2 inch high Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable Mail rolled or flat, never fold after reduction Photographs should be very distinct and show clear black and white contrasts They must be on glossy Avoid round and oval photographs white paper

Whenever possible "crop" photographs, i.e., mark portion that can be excluded when reproduced Crop marks should be on margin of photographs Do not run pencil lines through photographs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

"Fatty Indigestion"

Undigested fat in stool

One of the chief causes of distress in liver, gallbladder and bile tract disturbances is impaired

fat digestion, resulting in flatulence upper abdominal discomfort, steatorrhea, constipation and related symptoms

Of considerable importance also is the interference with absorption and utilization of iron, calcium, and fat-soluble vitamins—D, E, K and Carotene-leading to well-known deficiencies in these essential dietary factors

Degalol—chemically pure deoxycholic acid—provides Nature's emulsifier to facilitate fat digestion and absorption

In the presence of lipase (which is rarely absent), one or two tablets of Degalol t 1 d usually suffice to reduce appreciably the symptoms of impaired fat digestion and to allow for ab sorption of ingested fat-soluble vitamins

THE red light of scientific control is holding up a 24 000 quart tankful of Carnation Evaporated Milk. Not a drop will move on for final processing until the plant chemist has certified that particular batch for correct butterfat and total milk solids content Every Carnation evaporating plant has its own laboratory and a central laboratory regularly double checks samples from all plants. Thus is assured the uniformity of composition that makes every Carnation Milk infant feeding formula a known and dependable quantity—anywhere and any time

THE MILL EVERY DOCTOR KNOWS

There are so many kinds of Eczema

Tarlonis is of outstanding value in Eczema psorlasis Ringworm Occupational Dermatitis Folliculitis Seborrheic Dormatitis Intertrigo Pityriasis Pruritus Tinea Cruris In 24 oz. 8 oz. 1 lb and 6 lb. jars. When intection super venes SUL TARBON! venes SUL TARBON! ombin s the presulte

TAR IS THE MASTER REMEDY

AND THERE ARE so many tar preparations! Crude and refined, white and black, and in many different vehicles. In the hands of many leading dermatologists pediatricians and general practitioners. Tarbonis — be cause of its distinctive advantages — is the preferred tar preparation in the management of eczema.

In most instances eczema requires intense and prolonged treatment. Tarbonis presenting a 5 per cent alcoholic extract of carefully selected crude tars together with lanolin and menthol in a vanishing type cream is completely nonirritant. It is safely applied as often as desired, every two hours if indicated, for as long as needed, without leading to superimposed irritation or furunculosis.

In eczema of the face and hands Tarbonis is especially appreciated. It brings no stigma to the patient, since it leaves no trace upon the skin. The patient can apply it during business or social activities without arousing attention—it cannot be detected. It is greaseless non staining to skin, linen, and clothing and nonsoiling. Best of all it is free from all objectionable tarry odor exhibiting instead a pleasant soapy scent

Robins

Robins "Donnatal Elixir" marks an important step forward in spasmolytic therapy Developed for adults and children alike this outstanding spasmolytic and sedative now greatly widens the range of its therapeutic usefulness. As an elixir its exceptional palatability its case of administration and flexibility of dosage together with its prompt uniform action-all make it the spasmolytic of choice in such pediatric conditions as spastic pyloric stenosis, intestinal colic, diarrhea and enuresis. Donnatal a comprehensive spasmolytic effect - with an unusually wide margin of therapeutic safety-results from a synergistic combination of small fixed amounts of the principal belladonne alkaloids with phenobarbital Each 5 cm (1 teespoonful) of Donnatal Elixir equals 1 Donnatal tablet in therapeutic effectiveness. "Despoted" is the registered trade mark of A. H. Robins Co. Ethical Pharmaceuticals of Merit since 1878

A. H. ROBINS COMPANY RICHMOND 19, VA.

DOSAGE Infants: 1/4 teaspoonful 2 or 3 times daily as necessary Children: I teaspoonful 2 or 3 times daily as necessary Adults 1 or 2 tempoonfuls, 3 or 4 times daily FORMULA Each teaspoonful (5 cc.) contains Hyoscyamine Sulfate 0.1037 mg Atropine Sulfate 0.0194 mg 0.0065 mg Hyoscine Hydrobromide Phenoberbital (W. gr.)

AVAILABLE In pints and gallons.

another Robins' triumph

UNIQUE

In several important respects, Mandelamine is unique among the urinary antiseptics which the physician now has at his command Mandelamine is safe. It may be con-

fidently administered in therapeutic dosage virtually without consideration of toxic effects, thus eliminating the need for careful selection of patients.

Mandelamine is convenient. The uncomplicated oral administration of Mandelamine requires no supplementary acidification (except in those cases where urea splitting organisms are present), restriction of fluid intake, dietary control, or other special measures

Mandelamine is prompt and effective. Because of the chemical combination of mandelic acid and methenamine, Mandelamine provides early control and therapeutic effectiveness in common urinary infections. A physician's sample and literature on request.

A REVOLUTIONARY IMPROVEMENT IN VAGINAL DIAPHRAGMS

"BOW BEND"

Opens into Position with Rim Behind the Cervix FEATURES OF THE BOW BEND DIAFHRAGM:

No inserter required

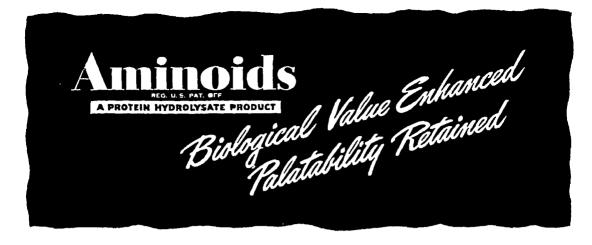

- . On compression forms an arc
- Largely self positioning
- Opens to a circle
- May be prescribed in all normal cases as well as in many deviating from the normal

Widely used by Child Spacing Clinics and by Gynecologists All sizes: — 60 to 100 mm

IMPROVED BIOLOGIC EFFICIENCY

Rat-growth curves, determined by independently conducted tests, demonstrate the high biological value of AMINOIDS,* compared with casein, recognized as a high-quality protein

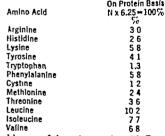

PALATABILITY and ADAPTABILITY

AMINOIDS retains the inviting palatability long associated with its name. May be given in a variety of appetizing ways—in hot or cold liquids, desserts, cereals, etc.

AMINOIDS is derived from selected protein sources (liver beef muscle, wheat soya yeast, casein and lactalbumin) Analysis indicates the presence of all the essential amino acids in significant quantities

Amino Acid Analysis†

On Protein Basis

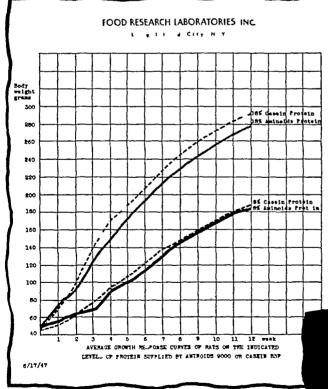

One tablespoonful tid supplies 12 Gm of protein as hydrolysate

Supplied as a dry granular powder, in bottles containing 6 oz

With the addition of 'Beminal' fortified with Iron I wer and Folic Acid, No 821 the 'Beminal' family now presents six distinctive forms and potencies for the effective treatment of vitamin 'B deficiencies. 'Beminal fortified with Iron Liver and Folic Acid is suggested for the treatment and prevention of iron-deficiency anemias and certain macrocytic anemias as well as adjunctive therapy in permicious anemia. Starting with the newest addition here are the six members of the versatile 'Beminal' family for 'B' therapy.

When a Bit of Candy

Means So Much

From a psychogenic point of view, anything that adds to the patient's sense of well being contributes to more rapid re turn of a normal outlook. Candy can serve in this capacity. When not contraindicated by the clinical situation at hand a piece or two of candy at the end of a meal leads to a feeling of satiety in a most pleasant form. Most persons like candy, and permission to enjoy this treat during the

convalescent period especially gives encouraging assurance to the patient that the clinical progress being made is satisfactory

That candies have a place in the dietary is evident from the many desir able foods with which most candies are made—eggs butter, cream milk and nuts. To the extent these foods are present candies contribute valuable protein, B complex vitamins and important minerals. Candies also provide concentrated caloric food energy, a desirable feature when weight loss must be corrected. Thus candy enjoys a worth while place in the dietary not only during convalescence, but also during health

COUNCIL ON CANDY OF THE

VRON ALONE IS NEEDED Correcting the hemoglobin level in hypochromic anemia patients is not always enough Many symptoms formerly attributed to lack of hemoglobin are now known to be due to multiple vitamin deficiencies Heptuna—a combination of seven essential vitamins plus the most readily available form of iron-corrects the entire anemia syndrome, not only the hemoglobin level. is a Michigan Hydrochlorid logether with other 8-compl

Match up the people and the horns

(It may mean money to you!)

The first two, of course, are very easy

The sea captain (1) goes with Cape Horn (2), and the musician (2) with the French horn (3)

That leaves the Average American (3) matched up with the Horn of Plenty (1)

As such an American, you'd like that to be true, wouldn't you?

It can be—and will be—for millions of Americans who, today, are putting money regularly into U S Savings Bonds

In ten years, as the Bonds mature, these millions will find that they have truly created a Horn of Plenty for themselves! For they'll get back \$4 00 for every \$3 00 they're putting in today!

There are now two easy, automatic ways to buy U S Savings Bonds regularly

The Payroll Savings Plan for men and women on payrolls, the Bond-A-Month Plan for those not on payrolls but who have a bank checking account

If you're not on one of these plans, get started *today* Your employer or banker will give you all the details

Let U S Savings Bonds fill up your personal Horn of Plenty for the years to come!

Automatic saving is <u>sure</u> saving . . . U.S. Savings Bonds

Introducing a NEW ganghonic blocking agent for peripheral vascular disease

ETAMON CHLORIDE

ERECTING A BARBIER against vasoconstrictor impulses ETAMON CHLORIDE permits an increased blood supply to affected limbs. By temporarily blocking the transmission of efferent impulses through autonomic ganglia, the sympathetic stimuli causing vessel spasm are interrupted. Thus, reduced blood flow due to abnormal reduction in caliber of peripheral vessels is combated.

ETAMON CHLORIDE is indicated in the treatment or:

Thromboangiitis obliterans (Buerger's disease)

Peripheral arteriosclerosis obliterans

Thrombophlebitis-relief of associated vasospasm

Causalgia or reflex sympathetic dystrophy Functional vascular disorders, Raynaud's phenomenon, acrocyanosis, livedo reticularis

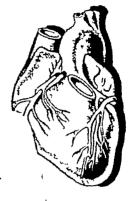

S A DIAGNOSTIC AID:

Peripheral vascular disease—selection of cases for sympathectomy

Administration: Intravenously or intramuscularly The uses and dosage of ETAMON are dependent upon the physiologic rather than the chronologic age of the patient. Descriptive literature on request.

Packaging: ETAMON CHLORIDE (tetraethylammonium chloride, P D & Co) is supplied in 20-cc. multiple-dose STERI VIALS[®] (rubber-disphragm-capped vials) each cc. of solution containing 01 Cm of ETAMON CHLORIDE.

"...a favored hypotensive for over fifteen years"

RELAXANT

QUICK, EFFECTIVE RELIEF so important to the management of the hypotensive is usually resultant when pa-

tients receive DIURBITAL

Acting promptly to effect a steady, gradual descent in blood pressure, without the hazards of abrupt drops, DIURBITAL provides prolonged vasorelaxant action DIURBITAL produces myocardial improvement by stimulating the myocardium and by diuretic removal of embarrassing fluid

Each Enteric Coated DIURBITAL tablet contains Theobromine Sodium Salicylate 14 gr 11/2 81 Phenobarbital DOSAGE: 1 to 2 Tablets 1 i.d Calcium Lactate

A large series of cases receiving DIURBITAL showed a pressure reduction of 70-80 mm of mercury * •Clin Med & Surg Vol 48 No 2

Specialties for Diseases of the Heart and Blood Vessels

in the treatment of nutritional anemia

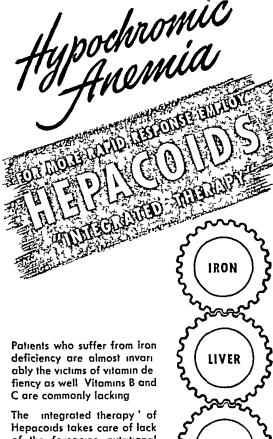

enters the picture

Failure to respond to iron therapy may be due to faulty absorption or to a deficiency of nutrients other than iron. The use of vitamin C for influencing the patient's response in the treatment of iron-deficiency anemia is indicated by its action in promoting the utilization of iron its role in the development of erythrocytes and its usefulness in correcting concomitant vitamin C deficiencies

Endoglobin-C Iron, B vitamins, Liver plus Vitamin C

In Endoglobin C tablets ferrous sulfate is combined with nutritional adjuncts which tend to improve assimilation and correct possible deficiencies that may complicate anemia Endoglobin tablets plain-without vitamin C-also available Both supplied in bottles of 100 Samples will be sent on request

Endo Products / Richmond Hill 18 N Y

The integrated therapy of Hepacoids takes care of lack of the foregoing nutritional elements and provides them in scientifically ascertained and balanced quantities

FORMULA

Per tablet:

Liver (Secondary fraction
50:1) Derived from 10
gm fresh liver
Ferrous Sulfate exsiccated
0 2 Gm
Thiamine Hydrochloride
Ribotlavin
Niacinamide
1.5 Mg
15 0 Mg
Ascarbic Acid (Vitaxin C)

Hepacoids are indicated in Iron Deficiency and Nutritional Anemias and in deficiencies of the essential B Complex and vitamin C, resulting from Pregnancy, Lactation, Periodic Blood Loss, Prolonged Illness and Nutritional Deficiencies

Why not stimulate more rapid recovery in these deficiency conditions, Doctor? Employ Hepacoids

PIONEERS in Research...and Leadership thru the years in combating OTITIS MEDIA

DOHO in realizing the need for a potent, topical well tolerated ear medication yet mindful that no one formula could be suitable for all conditions—devoted every facility and scientific resource to the development and perfection of AURALGAN and OTOSMO SAN Each has its sphere of usefulness each has been tested and clinically proven in many thousands of cases. Reprints and substantiating data sent on request

EACH A SPECIFIC...both effective!

Huralgan
IN ACETE OTITIS NEDIA

is a scientifically prepared completely water free Gly cerol (DOHO) having the highest specific gravity obtainable, containing antipyrine and benzocaine which by its potent decongestant, dehydrating and anal gesic action provides effective relief of pain and inflammation.

O-TOS-MO-SAN

IN CARONIC SUPPORATIVE DISTINGUEDIS AND AURAL DERMATITIS

is not just a mere mixture, but a scientifically potent chemical combination of Sulfathiazole and Urea in AURALGAN Glycerol (DOHO) base—which exerts a powerful solvent action on protein matter, liquefies and dissolves exuberant granulation tissue, cleanses and deodorizes, and tends to exhibitante normal tissue healing in the effective control of chronic suppurative offits media.

Lucrature and samples on request

THE DOHO CHEMICAL CORPORATION

Dietary Supplementation

MORE THAN ISOLATED NUTRIENTS

The observation that nutritional de ficiencies rarely occur singly, and the fact that individual nutrients are not metabolized by themselves but in conjunction with others, are both well established. Hence dietary supplementation—in order to be effective—must provide more than merely isolated nutrients.

The dietary supplement of Ovaltine and milk presents a rational mixture of essential nutrients of wide clinical applicability. It supplies not only B

complex vitamins, but also ascorbic acid, the fat soluble vitamins A and D, biologically complete protein, and readily utilizable caloric food energy in the form of fat and carbohydrate

This dietary supplement is especially useful to compensate for the inadequacies of a deficient diet, and is valuable when given in conjunction with specific nutrients when specific deficiencies are detected Easily digested and of low curd tension, it presents no undue digestive burden

THE WANDER COMPANY, 360 N MICHIGAN AVE, CHICAGO 1, ILL

The Established Regimen of Spa Treatment Fits Your Program

Here at the Spa your patient has the benefit of a regimen which fits into your program for his treatment.

The full therapeutic benefits of the Spa's naturally carbonated mineral waters are enlisted in this regimen. The program supplements your own medical guidance in the treatment of your patients who are suffering from cardiac, vascular or rheumatic disorders of a chronic nature.

Surrounded by superb man-made facilities, in a setting of great natural beauty, your patient is ideally prepared for the full benefit of your continuing care

Capable physicians are available in Saratoga Springs for consultation with your patient on the details of your program

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative cure at the Spa, you, too, will return to your practice refreshed—revitalized—ready for the busy days that he ahead.

For professional publications of the Spa, and physician's sample carton of bottled waters, with their analyses, write W S McClellan, M D, Medical Director, Saratoga Spa, 155 Saratoga Springs, New York

1111* The District Branches

In 1884 then, two State medical organizations existed side by side The Medical Society of the State of New York with its tomponent County Societies,2 and the seceding New York State Medical Association with its five District Branch Associations. The new Association was not official It could and did send representatives to the A.M.A., it did support the national code of cines and carried on an independent existence for many years

in "the last few years of the nineteenth century," says Walsh, "the sentiment began to make itself felt very generally throughout the medical profession of New York State that the maintenance of two State medical organizations was without any proper reason

Many New York City physicians belonged "to both their county medical ociety and their county medical associa-

In 1898, the State Medical Society changed its arrangement of Districts A special committee proposed "as the basis for the adoption of the Judirepresentation cial Districts of the State as given in the Legislative Annual of 1897, in the place of the so-called Senatorial Districts." This change was to be accomplished at the next annual session in 1899

Looking to a reunion of the two medical bodies, a Joint Committee of Conference was appointed by the Association and the Society in 1902 This was continued with different personnel in 1903, five members from each organization composing it. In 1904 arrangements for the consolidation of the two organizations were progressing favorably In 1905, Dr Eliot Harris' of New York reported to the House of Delegates of the AM.A. that before the next annual session, "The medical profession of

Act of March 22, 1707

I Trans. Med. Soc. State of N Y., 1893, p. 1819 History of the American Medical Association, Fishbein, 1947 p. 238.

the State of New York would have united, and he asked that a committee be appointed to apportion a proper number of delegates to that state"

In 1906, the bylaws of the eight District Branches were adopted (files in the office records of the Med Soc State of New York) in accordance with Chapter VIII, Section 4, of the Bylaws of the Medical Society of the State of New York, adopted in 1904 the reunion of the two groups the Medical Society of the State of New York acquired the District Branches and also retained its County Societies which were from then on grouped into eight divisions following the udicial districts of the State Thus was closed a period of twenty-two years and more of division and dissension in the medical profession of the Empire State

In 1925, at the suggestion of Drs Harry Trick and Eliot Harris, Dr Joseph Lawrence, Executive Officer of the Medical Society of the State of New York, officially assumed the responsibility for the programs and arrangements of the Branches As late as 1927, there existed the Western New York Society of Physicians, the Central, and the Long Island Society of Physicians The functions of these Societies were taken over in that year by the District Branches of the Medical Society of the State of New York by common consent

Between 1930 and 1935 the scientific programs of the county society meetings had a tendency to be predominantly surgical in character. However, when the meetings of the District Branches came under the direction of the Executive Officer this defect of the county society meetings was recognized and the interest of the District Branch meetings was heightened by changing the character of the topics to a more general nature

The original function of the District Branches has largely been lost to view They well served their purpose in the past of forwarding medical education and stimulating interest in meetings because of their large groups. Also the county societies were in many instances token organizations in the early days. Chapter VII, Section 12 of the current Bylaws of the Medical Society of the State of New York (p. 26, 1946)

states "Each President of a District Branch shall visit the County Societies of his district at least once a year and make a careful inquiry of the condition of the profession in each county of his district and shall report thereon to the House of Delegates" The origin of this directive is plain. It served its purpose in the past. How often is it done now?

This brief review of the history of the Branches raises the question of their present usefulness in view of the numerous scientific societies which have been formed in the last fifty years and to which most of the membership belongs in one category or another These numerous scientific societies actually fill the need now for which the District Branches were originally created Only their historical significance remains This is particularly true in the case of those Branches centered around large cities, but is not always the case, be it said, with reference to those Branches which are largely rural in location

A few years ago the officers of the District Branches were polled as to their opinions concerning the advisability of continuing the Branches in view of the relatively poor attendance at the meetings. The officers thought they should be continued. As far as we are aware the membership of each District Branch has never been queried similarly. Might it now be advisable to do so?

Four things might be asked (1) Do you favor continuing the District Branch meetings? (2) Would you advise the continuance of the scientific sessions? (3) If not, would you advise holding the meetings, but purely as a social function for the purpose of serving as a regional conference between the officers of the Society, the officers of the Branches, and the membership of the constituent county societies? (4) Should the regional conferences be devoted to consideration of legislative and economic matters which, latterly, have become of increasing significance to organized medicine?

The Journal invites your opinions on these questions Correspondence addressed to the editors will be placed in the hands of the Secretary of the Medical Society of the State of New York for his information

More Nurses Needed

Our latest information is that about 42,000 more nurses are needed in this country merely to meet the existing shortage. In addition, some 60,000 will be needed to meet mcreasing demands. According to Hygera 1

A survey made by the American Hospital Association indicates that the number of nurses necessary to supply the needs of the hospitals and the people of the United States is 300,000 Over 90,000 nurses are needed for private duty nursing in which one nurse takes care of one patient. At present almost 42,000 nurses are needed to meet the shortage that prevails probably at least 60,000 are needed promptly to meet increasing demands that will come with new hospitals and new services for nurses

Various reasons have been alleged to be responsible for the existing shortage. Before the war nurses worked in many instances a 12-hour day for six days a week. Now throughout much of the United States they work eight hours a day five days a week. This alone would mean almost twice as many nurses to

meet the same needs ...

In 1945, according to the same source, some 16 million patients entered the hospitals, as compared with 10 million in 1940 New hospital construction is under way now, and more is anticipated Hospitalization insurance is spreading rapidly and will probably increase the demand for beds

Under the arcumstances, adequate nursing care becomes more and more a matter of concern, particularly with regard to bedade nursing Whereas this nursing shortage is of vital interest to the medical profession, it should be of even greater concern to the public. In the final analysis, nurses must be recruited from the population in general, the medical profession cannot supply them although it can help instruct them. Why is there not a sufficient meentive for young women to study nursing?

During 1945 a careful survey was made of medical and public opinion regarding the profersion of nursing. The general belief seemed to prevail that the nursing profession is desirable but that it offers too little reward to those who practice it and too high a cost to those who need it. This is like the situation in which

an irresistible force meets an immovable object. How to reconcile the two aspects of this situation is an exceedingly difficult problem

The profession of nursing today includes far more than just taking care of the sick. Nurses have positions involving administrative responsibilities. They are concerned with education. The career of a nurse is considered suitable preparation for specialized training in physical therapy public health, and such fields as psychiatric, orthopedic, surgical, and obstetric nursing. The demand for properly qualified nurses is so great that a girl who completes her education in nursing need never be without work once she has secured a hierase to practice.

It should be conceded that in recent years many more careers in business and industry have become possible for women. Thus the field of competition has been enlarged over the time when nursing and teaching were, generally speaking, about the only careers acceptable.

The minimum educational requirements of most schools of nursing is graduation from high school. Some nursing is graduation from high school. Some nursing schools require one or more years of college work. In general students are admitted only when they have been in the upper third of the class. The preferred age is 20 to 25 years, but 18 years of age is con aidered acceptable in a good many schools. Thirty five is considered the upper limit. Some schools of nursing offer a combination four or five-year program which includes a diploma for nursing and a college degree These schools will admit high school graduates at 17 years of age.

The great number of nurses who get married soon after entering the profession is an indication that this is one profession which is excellent preparation for marriage. The gril who is trained as a nurse has several advantages over girls in other occupations when it comes to contact with the susceptible male...

It would seem that the best approach to the problem of getting more nurses would be an intensive campaign by the nursing profession itself. Unlike the weather, about which very few do anything but talk, something can be done, but it will take hard work first, the nurses themselves will have to "sell" nursing as a career to many more

Dec., 1947

young women and their parents To be convincing, this will mean personal contact, perhaps in the hospital, often in the home, sometimes by personal appearance at school assemblies in cooperation with local school authorities

Nursing associations will have to initiate campaigns of public education, in women's magazines, in the press, at meetings of women's clubs

The national and the several state medical societies can be of great assistance. Dr Edward Bortz, president of the AMA, has already appointed a committee to survey the nursing problem in the United States. The state medical societies through the cooperation of their women's auxiliaries can and assuredly will assist.

Says Hygera further

Much discussion has been going on in medical and nursing circles as to the desirability of educating more practical nurses. The excellent work the nurses' aides did during the war has emphasized this possibility. The criticism is made that professional nurses have raised

their educational standards and are getting far away from bedside nursing In Michigan the State Board of Education in cooperation with medical and nursing organizations has established six practical nurses' training centers to educate such nurses For a number of years Detroit has had a similar project tical nurses are recruited from the senior students in high schools The teachers are registered nurses on high school faculties tical nursing will be a part of the vocational educational system Standards for practical nursing systems will be established leaders who are developing this plan assert that nurses of this type will be able to do from 80 to 90 per cent of the ordinary bedside nursing in hospitals This may be the answer to the major portion of the problem

While more practical nurses are certainly to be desired, the primary objective should be the stimulation of young women by all available means to consider the full training course. In our view this is primarily the obligation of the nursing profession itself with all the assistance organized medicine and its individual physicians can summon

The Voluntary Hospital

We are reprinting herewith, slightly abridged, a statement received from the president of the Board of Trustees of one of the oldest and most respected voluntary hospitals of New York City—It is of the 400–500 bed class and probably typical of the situation elsewhere in the country—Seriously, it makes our blood run cold—Is there one among us who remembers what the term "voluntary" means? "Done, acting, able to act, of one's own free will, not constrained"

In days when people had money to leave they left it first to their children, then to some charity of their own, and often a final sizable amount to a voluntary hospital. The bequest to the hospital was a genuine response to the feeling, more prevalent in those days than the "liberals" of nowadays would have us think, that money carried with it responsibility and that one of the first of those responsibilities was the decent care of the sick poor

Now read

The voluntary hospitals are in a very difficult position, and one which might well cause many of them to close if the conditions do not change

The hospital is efficiently run and has a fine reputation. In spite of its age and reputation it has only approximately \$1,000,000 of endowment and reserve working funds of not more than \$200,000.

In spite of the fact that the fund-raising campaign has resulted in twice as much money being contributed this year, rising costs have used up this money faster than it could be accumulated, with the result that the meager working capital of the hospital is constantly being eaten into

There are only three or four hospitals in the city that will be able to endure such a strain for any length of time, and the demands upon all the hospitals are growing

There are two reasons for this precarious position that we find our voluntary hospitals in now One is the rising costs of food and services For example, the raise in the price of

meat two weeks ago increased the cost of meat for this particular hospital some \$4,000 a month. The increase of a penny in the price of milk increased the cost \$1,200 a month Second, the loss incurred by the care of the sick poor of the city This is of the greatest importance.

The city pays the voluntary hospital \$6 a day for city patients The most efficient hospitals run a cost of between \$11 and \$12 a day for the care of such patients, creating a deficit of \$5 to \$6 per day This strain is too great It cost the hospital used as an example in this article, \$189,000 out of pocket, to care for these city patients in 1946, when the city paid \$4 50 per day The city raised the rate to \$6 in 1947, but in spite of that raise it will cost this particular hospital in the neighborhood of \$150,000 in 1947 to take care of city patients. The city administration is well aware of the difficulties They are finding it in their own hospitals as well as the voluntary hospitals.

The total amount needed to bring the voluntary hospitals in approximate balance is not very large when considered in relation to other things and would not amount to much more than \$5,000,000. The danger is that if costs are not covered the voluntary hospitals will case to function, in which case it will cost the critical agree of the sick in public institutions than it does through the voluntary hospital system.

If this city, like many another, can't take care of its own ailing let it say so But do not let it keep up the pretense that it is doing so when actually it is asking private charity to shoulder half its burden and arrogating the credit to itself

Do not let the average citizen be guilled into thinking that the city or state is taking care of him when it is not. Not when private charity is being bled white.

If there ever was a matter which should become one for public discussion, this is it. If our social system is going to change, very well. If the fountains of private charity are to be exhausted, perhaps that is inevitable. But we can at least put our eards on the table.

We cannot allow our system of voluntary hospitals and our long and honorable tradition of the best care for the sick poor by the best men of the medical profession, unremunerated to be dragged down by the inadequacy of any system of social ized care that hasn't worked well, doesn't work well and probably won't work well

Are we to be forced to abandon a voluntury hospital system which is one of the proudest evidences we can present of the sense of obligation of our well to-do people and be constrained to substitute a municipal or state system of socialized care which will then be pointed out as one of the most recent and most glaring evidences of the failure of private enterprise?

Current Editorial Comment

Cancer and Chemistry—In a recently published editorial, Charles Huggins expresses the opinion that at long last a beginning has been made in the treatment of advanced cancer by chemical means. The tremendous progress in other departments of science, particularly in physics and chemistry, since 1941 has contributed heavily to advances made in the medical sciences Progress in the mastery of disease must go hand in hand with more knowledge of the structure and function of normal tis-

sues and organs. As advances against in fectious diseases in previous decades were made step by step, so now the assault on cancer shows benefits, not along the whole front but only in a few specific types of cumors. In experimental work the use of crude extracts and laboratory soups result in doubt, inaccuracy, and confusion. In vestigators find the greatest rewards in experiments with pure chemicals.

The treatment of cancer is greatly handicapped by the lack of reliable chincal tests Until more dependable tests for cancer are decised it will be impossible to discern the

Nov 1947 Charles: Editorial, Surg. Gynec. and Obst.

slight or minute benefits (or harm) following the administration of any given therapeutic agent. At present the only valuable clinical tests of neoplastic activity are those for tumors of the blood-forming organs and for cancer of the prostate. Rapid and reliable information concerning the presence and extent of cancer is available from an examination of the circulating cellular elements in the blood in neoplasms of the hemopoietic tissues, and by determining the values of serum phosphatases in cancer of the prostate

Chemical agents that seem to have some inhibiting effects on the growth of cancer may be divided into three groups necrotizing agents, competitive inhibition, and nuclear damage

Necrotizing agents It has long been known that the products of certain bacteria, when administered parenterally, produce severe hemorrhage in the tumors within a few hours, with subsequent necrosis of malignant neoplasms. In a brilliant series of investigations, Shear and his coworkers have succeeded in separating the hemorrhage-producing agent in a culture of Serratia marcescens (Bacillus prodigiosus) from the toxic and mert contaminants Unfortunately, the necrosis is seldom complete and while some tumors regress, others usually remain viable Further experiments with this more purified and powerful polysaccharide are necessary to determine its usefulness, if any, in the treatment of cancer/

Competitive inhibition In cancer of the prostate, an essential for the nutrition of the malignant cells often is androgen androgen supplied in adequate amounts, the tumor grows vigorously Conversely, the cells tend to wither when androgen is withheld (orchiectomy), or when estrogen is administered Aside from radioactive chemicals, the first agent of known chemical composition favorably to influence widespread cancer was estrogen Also it was the first substance known to exert this effect when given by mouth Both estrogen and orchectomy may be regarded as nonspecific chemotherapeutic agents

In male and female mice, compound E of Kendall, derived from the adrenal cortex, causes massive involution of lymphosarcomas. White and Dougherty have demonstrated that adrenal stimulation decreases the activity of lymphoid tissue. These

biochemical observations are supported by the fact that 11-dehydro-17-hydroxycorticosterone has damaging effects on lymphomas

Para-aminobenzoic acid is a substance essential to the growth of certain bacteria. The ability of sulfonamides (demonstrated by Wood and Fildes) to neutralize these beneficial effects of para-aminobenzoic acid is an illustration of competitive inhibition.

Nuclear damage The injurious effects of irradiation on tissue cells, including the frequently observed mutations, are probably the action of the rays on the nucleic acids of the cell nucleus Radioactive isotopes with a short period of decay may be used to apply soluble radioactive chemicals to tissues throughout the body Huggins believes that "radio-active phosphorus has great value in chronic lymphatic and myelogenous leukemias and is probably the best therapeutic agent available for polycythemia vera"

Since Lushbaugh demonstrated that the lymphocyte count of rabbits was reduced by the use of nitrogen mustards (B-chloroethyl amines), they have received systematic biochemical investigation. In some cases of Hodgkin's disease, regression has followed the therapeutic use of nitrogen mustard. Aside from those produced by radiant energy, the nitrogen mustards are the only agents known to produce mutations chemically.

Another drug capable of producing regression in cancer growth is ethyl carbamate (urethane) It delays cell division without great interference with respiration Recently it has been shown that urethane reduces the growth of prostatic cancer, particularly those in relapse after treatment with hormones Since this toxic drug acts by pycnosis and is not antiandrogenic, it is a new weapon involving a new principle in the treatment of advanced cancer

We suggest restraint of undue enthusiasm over optimistic reports of the results of chemotherapy in cancer. Aside from the conservative use of endocrines, it is well to remain critical and skeptical of results claimed for drugs having the power and potential dangers of necrotizing agents, radioactive isotopes, the nitrogen mustards, and urethane. Years must pass before these dangerous drugs can safely be used except in experimental laboratories and in clinics under strict control.

FATAL HEMORRHAGE ASSOCIATED WITH THE THIRD STAGE OF LABOR

A Study of 60 Maternal Deaths, Brooklyn, 1937-1947

MORRIS GLASS MD, and ALEXANDER H ROSENTHAL MD Brooklyn New York

(From the Brooklyn Committee on Maternal II elfare)

IN RECENT years hemorrhage has been pro-1 jected into the limelight as the major cause for maternal mortality Gordon was one of the first to show its important role, a conclusion reached after studying the deaths in Brooklyn from 1937 through 1941 1 He analyzed the figures released by the Bureau of Records and Statistics of the City of New York and showed how the statistics frequently concealed the true aignifi cance of hemorrhage. When infection or toxemia was given as the principal cause it was duly recorded on the death certificate Hemorrhage was often not mentioned or, if so was considered as an associated cause by the statisticians and was not tabulated Statistical preference in bemorrhage deaths was given to infection, toxemia, cesarean section, embolism, and abortion Further, some deaths assigned to nonpuerperal causes were actually the result of hemorrhage For example, the deaths of two patients from hemorrhage and shock, one after postpartum hemorrhage and the other after rupture of the uterus, were attributed to syphilis because of positive serology The revised statistics clearly showed the prominence of hemorrhage (see Table

This report includes for the most part deaths in which hemorrhage was listed as the primary cause. There were an even greater number during the same period in which hemorrhage contributed heavily to the mortality though not classi

fied as the principal cause. The Brooklyn Committee on Maternal Welfare studied 126 maternal deaths in 1938. In 21 cases, or 17 per cent, hemorrhage was cited as the primary cause of death And yet in 40 per cent of the remaining 105 cases, the blood loss was sufficient to warrant treatment and thus contributed to death. Similar studies in other years revealed essentially the same in eidence of hemorrhage

That this experience is not unique to Brooklyn is shown by other reports. A study from the Province of British Columbia from 1941 through 1943 indicated that the number of maternal deaths from hemorrhage were 42, infection, 28, and tovemia 22 2 Davis and Grady reporting from the Chicago Lying In Hospital stated that infection is rapidly disappearing as the major cause for death" and indicated that hemorrhage is playing the principal role 3 Moreover, a comparative study of maternal mortality in the United States for 1940 and 1942 clearly showed the greatest reduction in maternal deaths from infection while homorrhage deaths were only slightly decreased.4 It is generally agreed that the factors responsible for reducing deaths from infection are better obstetric care, chemotherapy. antibiotics and more frequent use of blood transfumons. It is clear, then, that the major problem in further decreasing maternal mortality lies in the prevention and treatment of hemorrhage

For the past ten years all maternal deaths in Brooklyn have been reviewed by the Brooklyn Committee on Maternal Welfare. A survey of these records affords valuable maternal for study, even though the incompleteness and inadequacy of some reports must be recognized. A few were not available. However, the majority were acquired for screening and represent the true picture. Any omissions we believe will not after the conclusions.

Our study is limited to a critical survey of fatal hemorrhages associated with the third stage of

المحوسية

labor arising from uterine atony, retention of placental tissue and inversion of the uterus will include, briefly, placenta previa cases which died from postpartum hemorrhage, since a study of this complication is in progress Deaths from rupture of the uterus have already been analyzed and consequently are excluded from this report 5 Deaths from hemorrhage and shock following cesarean section are not included except those associated with massive postpartum hemorrhage There are many other section deaths from moderate hemorrhage associated with operative shock These fatalities are principally and anesthesia hemorrhage deaths and constitute an important problem in themselves

The major causes of death from 1937 through 1945 are noted in Table 2 These revised statistics have already been published and clearly illustrate the role of hemorrhage 167

Material for Study

The causes for hemorrhage in these 60 cases were atony of the uterus, 40, retention of part or all of the placenta, 12, inversion of the uterus, 5, and varied causes in 3. The following data were noted and evaluated

- 1 Predisposing factors
- 2 Methods employed in delivery of the fetus
- 3 Management of the third stage of labor
- 4 Means employed to control hemorrhage
 - (a) Oxytocics
 - (b) Uterine manipulation
 - (c) Uterovaginal pack
 - (d) Hysterectomy
- 5 Blood transfusions
- 6 Time of death in relation to the hemorrhage

Twenty-one additional cases of placenta previa which died of postpartum hemorrhage are included A more detailed analysis appears elsewhere

Atony of the Uterus (40 Cases) —This complication was present in two thirds of the cases. In 24 of these predisposing factors were obvious. Ten were associated with premature separation of a normally implanted placenta, in each of 3 cases fibroids or gross mismanagement of the third stage of labor were responsible, in 2 cases an overdistended uterus or prolonged labor contributed to the atony of the uterus, while in 4 of the cases the factors were varied. These cases

which illustrated predisposing factors were as follows

Case 1—A 34-year-old, white gravida IV, para III, was admitted at term and in labor After fortyeight hours the cervix was fully dilated and within ten minutes she delivered an 8 pound 13 ounce fetus The placenta was delivered within spontaneously a short time, when one ampule each of pituitrin and ergotrate were given Vaginal bleeding was profuse and persisted despite vaginal packing Examination by a consultant revealed a fibromyoma, the size of a lemon, protruding into the uterine cavity continued in spite of a uterovaginal pack. One and one-half hours later the patient was in extremis and was transferred to the operating room for hysterectomy Thirty minutes later, after receiving only 200 cc of blood, the patient died before the operation was started

Case 2—A 30-year-old white gravida V, para III, who had had two previous cesarcan sections, was admitted for elective section. The operation was done under gas oxygen ether anesthesia. Dense adhesions were encountered. The placenta was firmly adherent and was difficult to remove. The patient bled profusely, and it was estimated that between 1,700 and 2,000 cc of blood were lost during the fifty minutes of operating time. The patient expired thirty-five minutes after the operation was completed, without receiving any blood.

Case 3 —A 31-year-old white gravida II, para I, was admitted to the hospital at the thirty-third week of gestation because of marked enlargement of the uterus, causing respiratory distress Although labor began spontaneously, the contractions were weak and meffective The membranes were artificially ruptured, and 8,000 cc of fluid allowed to The contractions then became stronger, and by low forceps under gas oxygen ether anes thesia, the patient was delivered of a macerated stillborn weighing 7 pounds 13 ounces The placenta followed soon afterwards The uterus contracted normally, then relaxed, and from this point until death, six and one-half hours later, the hemorrhage was not controlled Treatment included oxytocics, uterine manipulation, uterovaginal packing and 2,000 cc. each of blood and plasma given in transfusion sanguination far exceeded blood replacement

The methods employed in delivery of the fetus are recorded in Table 3

TABLE 3 -METHOD OF DELIVERY

Spon taneous 19 10 3 1	15 1 1 1		Cesarean Section 4 0 0 1
- 00	18		
	taneous 19	taneous Forceps 19 15 10 1 3 1 1 1	taneous Forceps Extraction 19 16 2 10 1 1 1 3 1 1 1 1 0

Delivery of the placenta in this group was remarkable only because it occurred in six of the vaginal cases more than one-half hour after deliv-

ery of the child Three required manual removal Both of the following cases illustrate the role of general anesthesia in accentuating uterine atony, and, in addition, illustrate mismanagement of the third stage of labor

Case 4.- A 30-year-old white primipara with uterine fibromyomata was admitted at term and in labor. After seventy two hours of labor with the cervix incompletely dilated multiple Dührssen s incisions were made under general anesthesia. Manual rotation of a persustant occipitoposterior was performed followed by forceps extraction. cervical incisions were repaired with the placenta still retained Continuous bleeding from the uterus occurred during this time. The placents was manually removed two hours later and the uterus packed with gauze. The record indicated that the cervical incisions were resutured, probably having been durupted during the intrauterine manipulation The patient went into shock. Treatment included 3 repeated packings and 2 Intrauterine injections of pitultran. The patient died two hours after delivery with only 750 cc. of blood given.

Case 5 -A 32 year-old white primipara was admitted at term. Labor was characterized by utermo inertia. A general anesthetic was given in prepara tion for delivery Examination showed the cervix to be incompletely dilated and so the patient was returned to bed. Later Dührssen s incisions under general anesthesia were performed because of the failure of complete cervical dilatation. The head was manually rotated and the fetus delivered with axistraction forceps. With the placenta in situ and the patient under continued anesthesia, the cervical and epenotomy wounds were repaired. She bled during this procedure. The placenta was then delivered apontaneously Hemorrhage continued and she died one hour and forty-five minutes after delivery

Although the records were often incomplete concerning the use of general anesthesia (Table 4), we regard it as a most important contributing factor to hemorrhage and shock. Local anesthesia has long been favored in our hospital because it permits completion of the third stage and penneal repair without any further general anesthesia.

with no transfusions having been given.

Ten patients with premature separation of a normally implanted placenta died of postpartum benormage superimposed on antepartum or intrapartum bleeding All were inadequately treated. Neither effective conservative therapy nor cesarean section was performed in any case Only 2 received oxytoeics prior to delivery. Six were delivered spontáneously, 3 by forceps and 1 by breech extraction. Despite massive blood loss in every case, only 4 received transfusions and in 2 the quantity given was small. One received a large volume of blood while the remaining one was not transfused until she was in irrever sible shock. Packing of the uterus was performed in 8 cases and in half the vagina was also packed All the patients died from hemorrhage and shock within six hours after delivery and 4 of these died within two hours.

Retention of the Placenta —There were 12 fatal hemorrhages associated with retention of pla cental tissue. Five patients died with the pla centa completely retained Brief abstracts are as follows

- 1 The delivery was done at home by a midwife, and the patient admitted to the hospital in shock after severe hemorrhage Death occurred with the placenta retained
- 2 The ambulance surgeon found this patient dead at home The baby had been delivered without attendance and the placenta was retained The floor was covered with blood
- 3 Delivery took place at home without attendance The patient was admitted to the hospital in irreversible shock with the placents retained. Death occurred in less than one hour
- 4 Normal spontaneous delivery took place in a hospital The patient was transferred to her bod with the placenta retained and with no sign of separation She was found dead in bed from hemorrhage thirty-six hours later
- Rapid spontaneous delivery took place There was an uncontrolled profuse hemor rhage five minutes later Death occurred within an hour with the placenta retained

Seven patients had retention of part of the placenta. Three had spontaneously delivered a placenta which was presumed to be intact. In one patient ten days elapsed before the fatal hemorrhage occurred Manual removal of the placenta had been performed in 4 cases two with great difficulty. It was obvious that incomplete removal caused the continued hemorrhage in all cases.

Inversion of the Uterus —This serious complication occurred in five patients Traction on the cord and/or fundal pressure were the obvious causes in four cases. In the remaining case the inverted uterus appeared at the introitus following expulsion of the placenta The inversion was immediately recognized in three patients Reposition was attempted in two and thought to be successful Hemorrhage and shock continued and further examination revealed the persistence of the inversion

Case 6 -A 20-year-old primipara was admitted to the hospital at term and in labor Under chloroform anesthesia a fetus weighing 3465 Gm was The placenta was despontaneously delivered livered twenty-four minutes later by "gentle traction on the cord without any pressure on the fundus" The blood loss up to this point was estimated at 300 cc. About five minutes after the expulsion of the placenta, the patient went into shock, although the continued bleeding did not seem to be sufficient The fundus could not be felt to account for it suprapubically, and pressure in this area caused in-Treatment included pituitrin, creased bleeding Trendelenburg position, intravenous glucose, heat, and caffeine and sodium benzoate A consultant examined the patient one hour and fifty minutes later and found the fundus to be inverted to the level of the introitus. Under ether anesthesia the inversion was corrected and this was followed by cessation of the bleeding She died two hours later four hours after delivery of the placenta, without receiving any blood

Autopsy showed visceral evidence of evsanguination The uterus was not ruptured and was in nor-

mal position

Case 7 —A 26-year-old white gravida II, para I. was admitted to the hospital at term and in labor The patient delivered spontaneously under open drop ether anesthesia Because of a bleeding third stage, the doctor attempted to remove the placenta by traction on the cord and pressure from above During the process the cord ruptured and now the placents was visible in the vagina Manual removal of the placenta from the inverted uterus was performed with difficulty The organ was "reposited," and a pack introduced into the "uterus" and the vagina Bleeding continued through the pack. A consultant was called who advised expectant treatment since the "inversion had been corrected." Twelve hours later the patient was in shock second consultant advised immediate hysterectomy The uterus was found to be inverted, although elevated into the abdominal cavity by the vaginal pack.

The inverted uterus was first corrected and then extirpated. Postoperatively, the patient received three 500 cc blood transfusions, causing a marked improvement in her general condition. However, two days later the urine showed pus cells and 4 plus albumin. On the following day anuma was noted, and this condition persisted until death from uremia on the fifth postoperative day. In all probability this complication resulted from incompatible blood, since cystoscopy revealed both ureters patent.

Case 8—A 20-year-old white primipara was admitted at term and in labor Delivery was performed by low forceps under gas-oxygen anesthesia Five minutes later, the placenta was noted bulging from the introitus and was expelled spontaneously by the

Duncan method A reddish, ragged, pear-shaped mass, recognized as an inverted uterus, appeared at the vulva. It was promptly "reposited," and a vaginal pack introduced Bleeding persisted The pack was removed, and according to the record the inversion of the uterus was now corrected thirty minutes after delivery A transfusion of 500 cc of blood was given within two hours and the patient rallied An hour later the patient went into shock and was given intravenous glucose solution, coramine caffeine and sodium benzoate, adrenalin, but no further blood transfusion. The patient died from hemorrhage and shock six hours after delivery.

Case 9—A 29-year-old, white gravida IV, para III, seven months' pregnant, delivered the baby before the ambulance doctor arrived. The placenta was retained. The doctor failed in his attempt to express the placenta. Fifty-five minutes later the placenta was delivered by a modified Credé maneuver and the uterus was inverted. The patient was hospitalized in shock with the uterus inverted, and died one hour and twenty minutes after delivery. No transfusion was given

Case 10—A 23-year-old white primipara was admitted at term. After thirteen hours of labor, the cord prolapsed, and delivery was completed by breech extraction. The placenta was expressed. Two and one-half hours later profuse bleeding occurred, and the patient went into shock. The patient received 1,100 cc. of blood, recovered from shock, bled again two days later, and again went into shock. At this time the fundus could not be felt suprapulically, and vaginal examination showed an inverted uterus. The patient received 1,500 cc. of blood before the inversion was corrected surgically. The patient died three days later of sepsis.

Miscellaneous Cases —There were 3 miscellaneous cases One of particular interest is as follows

Case 11—A 32-year-old, white gravida III, para II, was admitted to the hospital at term — Fourteen hours after admission with the cervix fully dilated, an ovarian cyst was found obstructing the head Laparotomy was performed and a dermoid cyst removed — Vaginal delivery was accomplished by forceps, and the placenta was expressed — The patient died three hours later from shock without appreciable external bleeding — No transfusions were given. The cause of death was slipping of the pedicle ligature

Deaths from Postpartum Hemorrhage Superimposed on Antepartum and Intrapartum Hemorrhage in Placenta Previa—Fifty deaths from placenta previa occurred during the ten-year period covered in this study and will be reported elsewhere. Twenty-one patients died from postpartum hemorrhage, 2 following cesarean section, and 19 after being treated vaginally. In the latter group 8 had clinic evidence of rupture of the uterus, although in only 2 cases was rupture actually diagnosed, either by palpation or at autopsy.

The increased likelihood of postpartum hemorrhage in placenta provis and the rationale for it have been discussed in obstetric textbooks. When the placenta is largely implanted in the lower segment, its separation may be retarded and im paired by the failure of the lower relaxed portion of the uterus to contract as effectively as the upper portion Moreover the lessened contractions and retractions of the lower segment may bring about meffective hemostasis of the large blood mauses, formed here as a result of the previa. It has also been suggested that postpartum hemor thage in placenta previa is due to small unrecog mied lacerations in the highly vascular lower segment rather than to abnormal muscular con tractions *

Time of Death. (See Table 5) Forty-one patients died within five hours. 29 of these were dead in three hours. All but three of the remain ing expired within 15 hours. Two of the three remaining patients died from sepsis several days after delivery In the remaining case retention of part of the placenta caused a fatal hemorrhage 10 days after delivery The rapidity with which these patients died was strikingly in accord with Beecham's report of hemorrhage deaths in Phila delphia. He noted the average time between delivery and death to be five and one-half hours It is obvious then that obstetricians must recog one predisposing causes for hemorrhage, and be prepared to deal with them adequately Moreover, they should have a defense ready for patients who bleed unexpectedly

Blood Transfusions —Only 13 patients received adequate amounts of blood (see Table 6) Insufficient quantities were given in 19 cases, while 23 patients received no transfusions at all. Thus, 50 per cent of the cases received either no blood at all or insufficient amounts. Since 41 patients dued more than three hours after the hamor rhage, there is justification for the inference that there was time enough for transfusion.

Whole blood is the only substitute for blood loss. To avoid delay all patients should be typed and Rh'd during their prenatal course. Moreover, the recognition of the Rh factor makes transfusion less feared from reactions litherto un explained. Rh negative type O blood of low titer should be on hand in all maternity hospitals and should be employed to combat exanguinating hemorrhages while cross matching is being done. At the very least, plasma should be given in such emergencies as a temporary expedient.

Pack and Hysterctomy—(Table 7) Vagual and/or uterine packs were unsuccessfully employed to control hemorrhage in 36 cases. The uterus, alone or in combination with the vagual was packed in 31 cases, and even in some repeated packings were employed.

Obstetric textbooks recommend the use of a uterine pack to control bleeding, provided more conservative measures fail. Despite this statement there has been a growing tendency to discourage its use in Brooklyn. At a recent meeting of the Committee on Maternal Welfare few would defend its use in a pertinent case under discussion at that time.

We believe there is a definite place for the pack. If a patient experiences a severe postpartum liemorrhage from an empty atonic uterus which fails to respond to massage oxytocics intrauterine pressure and abdominal manipulations few would standidly by and withhold the use of a pack

There are two reasons for the failure of a pack to control hemorrhage. The first is an incorrect diagnosis of the underlying cause of hemorrhage. In the presence of a lacerated cervix or uterus, or with retention of placental fragments, hemorrhage cannot be controlled by the pack. Packing the uterus of a patient in irreversible shock is often futile, for the organ may fail to contract and retract. Excessive blood loss causes anoxia and tissue damage, and such alterations within the myometrum may contribute to atony

The second reason for failure is faulty technic. Uterine packing is ineffective unless a firm, molst pack is introduced to the fundus, and the entire cavity is packed layer by layer with no intervening spaces remaining to favor the accumulation of blood. This is best done under general anesthesia. Perhaps the greatest value of the pack lies in reducing the blood loss while the operating

room is prepared for hysterectomy. Repeated packings are inadvisable, particularly if the above factors have been taken into account. Hemorrhage which is not controlled with one pack is not likely to respond to another, and precious time and blood are lost.

Five patients had hysterectomies in a valiant attempt to control the bleeding but were already in irreversible shock at the time of operation. A uterus, failing to respond to all the accepted methods of treatment, should be extirpated rapidly, while the patient is receiving large amounts of blood. Analysis of these 60 cases indicates that many of these patients might have survived, had this procedure been used early enough.

Management of the Third Stage of Labor — Analysis of these records indicated great difficulty in determining the factor of mismanagement of the third stage of labor in causing the fatal hem-It was clearly a major factor in many Thus, the 12 cases of retention of all or part of the placenta fitted into this group 5 cases of inversion of the uterus were also examples of mismanagement In some of the patients in the atony group the placenta was allowed to remain in the uterus for more than an hour despite a blood loss exceeding 1,000 cc group there were also instances of continued general anesthesia while lacerations or episiotomy wounds were being sutured with the placenta in situ Furthermore, some patients were removed from the delivery room with the placenta completely retained, and while in bed, unattended. suffered a fatal hemorrhage Still another factor was the retention of part of the placenta, although the doctor had been of the opinion that the placenta had been delivered intact In cesarean sections the placenta was only casually examined, if at all, before the uterus and the abdomen were closed It becomes evident, then, that the proper conduct of the third stage of labor is the best prophylaxis against hemorrhage

It may not be amiss to recapitulate the management of the placental stage, the stage in which hemorrhage is the great hazard. One must recognize any predisposing cause for abnormal separation and expulsion of the placenta Conditions which must be prevented or, if present, recognized, are as follows excessive and prolonged use of analgesia, inertia caused by overdistention of the uterus due to (a) multiple pregnancy, (b) large baby, and (c) hydramnios; tumors of the uterus, i.e., fibroids, placenta previa and ablatio, history of previous abnormal third stage, operative trauma (Beecham called particular attention to this factor³), long, general anesthesia, full bladder, and pre-existing anemia

Signs of placental separation must be awaited before any abdominal manipulation is attempted since premature expulsion of the placenta may initiate bleeding from partial separation arbitary period of time need be set in awaiting spontaneous separation of the placenta in the absence of bleeding, as long as the obstetrician remains with the patient, and the patient remains in the delivery room. Under no circumstance should a patient leave the delivery room with the placenta retained The majority of obstetricians feel that if one hour has elapsed, and signs of separation are absent, manual removal of the placenta under general anesthesia should be done if Credé expression fails The difficulties and hazards of this procedure have been exaggerated

The technic employed in expressing a completely separated placenta is important uterus should be stimulated to contract No attempts at expulsion should be made while the uterus is relaxed since this may cause inversion of the organ Four fingers of one hand with the thumb anteriorly grasp the fundus The force is directed toward the birth canal, using the contracted segment of the uterus as a piston cord must not be pulled upon, since this too might cause inversion, especially if fundal pressure is applied while the uterus is relaxed placenta appears at the introitus, the uterus should be lifted up and out of the pelvis by placing four fingers behind the pubis and directing the force upwards The contracted fundus is then gently massaged It is our routine to administer one ampule of ergotrate intramuscularly at this time

Estimated blood loss during the third stage is notoriously unreliable. When precise determinations are made, it is found to be far in excess of the amount estimated. Accordingly, in the presence of a bleeding third stage, when Credé expression fails, manual removal must be prompt. The uterus should always be re-explored for placental fragments or uterine lacerations. Placenta and membranes should be carefully inspected to be certain that no cotyledon or succenturiate lobe has been left behind.

Bleeding following complete expulsion of the placenta and membranes is due either to atony of the uterus or to lacerations in the birth canal. The latter can be seen, and, moreover, the uterus is firmly contracted. One must be certain that the uterus is completely emptied. It is occasionally difficult to determine the completeness of the expressed placenta. Exploration of the uterus under strict asepsis is advocated to remove any retained fragment.

If the uterus is relaxed or relaxes intermittently, it is then elevated and massaged One ampule of pituitrin is given intramuscularly along with one ampule of ergotrate intravenously If the uterus fails to contract and bleeding con tinues in spite of therapy, then the following procedure is advised the operating room should be prepared, the uterus and vagina should be tightly packed with wet gauze, blood transfu sions, which should have been started already, are continued, and a hysterectomy should be per formed rapidly if bleeding is not controlled

Rupture of the uterus occurs more commonly than is generally realized Of 660 maternal deaths in Brooklyn, 30 or 5 4 per cent were due to utenne rupture This is far greater than the 0.7 per cent incidence reported by Beecham . Rupture must be considered when shock is greater than the estimated blood loss warrants, and uterine exploration should be made. This procedure is recommended routinely after such highly traumatic vaginal procedures as internal version, difficult midforceps and unorthodox breech extraction through an incompletely dilated cervix.

The majority of reports indicated the use of intravenous and subcutaneous fluids and such stimulants as caffeine, adrenalin, coramine and digitals in an attempt to save the patient The statement would frequently read as follows "Despite the above treatment the patient finally succumbed from cardiac failure" Death from hemorrhage and shock is never due to cardiac failure

The need for adequate blood replacement in hemorrhage cannot be stressed too strongly or too often Reliance should not be placed on intravenous or subcutaneous fluids with crystalloids or even on blood plasma Any patient with anteor intrapartum hemorrhage is predisposed to postpartum bleeding and should be cross matched immediately There should always be sufficient blood available for replacement.

Conclusions

- 1 Sixty deaths from hemorrhage associated with the third stage of labor have been reviewed.
- Multiplicity of causes for hemorrhage was noted in many cases. The major factors were atony, retention of placental tissue and inversion of the uterus
- 3 Seven patients had partial retention of placental tissue, unrecognized until fatal hemor rhage Careful inspection of the placenta after

vaginal and abdominal delivery should be routine

- Tive patients died with the placents completely retained Manual removal of the placenta is not hazirdous and when indicated, should not be delayed
- Five cases of inversion of the uterus occurred, four after improper conduct of the placental stage They were generally not recog nized until profound shock intervened
- Prolonged general anesthesia contributed to hemorrhage Local anesthesia should be used more frequently
- 7 The time between hemorrhage and death. though brief was sufficient to effect adequate blood replacement in the majority of the cases.
- The conduct of the third stage of labor has been reviewed. Its mismanagement was obvious in many instances and contributed heavily to the mortality
- The prophylaxis against hemorrhage should include the correction of anemia during the prenatal period All patients should be typed and Rh'd early in pregnancy Compatible whole blood should be available at all times. Blood banks are the best source from which to obtain this whole blood
- 10 Although the pack was used unsuccessfully in 35 patients, it has a definite place in the treatment of postpartum hemorrhage The same is true of hysterectomy
- The use of cardiac stimulants and intravenous fluids in the treatment of hemorrhage is futile. Adequate whole blood replacement is the only proper therapy
- 12 In a group of 50 deaths from placenta previa, to be reported 21 patients died from postpartum hemorrhage superimposed on anteand intrapartum bleeding The cause of this complication has been discussed

FAILURES IN GLAUCOMA OPERATIONS HISTOLOGIC STUDY

BRITTAIN F PAYNE, M D, New York City

(From the Department of Pathology, New York Eye and Ear Infirmary and New York University School of Medicine)

THE HISTOLOGIC study of eyes, removed after unsuccessful operations for glaucoma, shows that ideal surgical relief has not been devised so far as the laboratory is concerned. In the examination of approximately 100 eyes with glaucoma for an earlier report and in specimens reviewed since that time, at least three universal findings are noted.

- 1 Retention of adhesions between the iris and the corner.
- 2 Fibrotic closure of new filtration channels
- 3 Inflammation of the uvea and fibrous tunic

Adhesions or synechiae between the anterior surface of the iris and the posterior surface of the cornea are composed of such dense connective tissue that permanent separation by operation is almost impossible. The artificial filtration channel or channels become closed by the proliferation of connective tissue, and it makes little difference whether a portion of the iris is included in the operative wound. Inflammation of the uveal tract or progressive iridocyclitis and fear of sympathetic ophthalmia often force the surgeon to admit defeat and advise enucleation.

The operations for glaucoma which illustrate the general microscopic findings of all globes sent to the laboratory are the indectomy, the indencless and the trephine. A study of these eyes shows the following in common

- 1 Edema and bullous changes in the corneal epithelium
- 2 Generalized thinning of the cornea and sclera
- 3 Inflammation at the limbus
- 4 Shallowness of the anterior chamber
- 5 Dilatation of the pupil and adhesion of the iris to the cornea and sometimes to the lens
- 6 Inflammatory changes in the iris and ciliary body
- 7 Swelling of the crystalline lens
- 8 Depression of the optic nerve with atrophy
- 9 Degeneration of the ganglion cells of the retina
- 10 Unusual findings in the vitreous body

A specimen of chronic simple glaucoma not relieved by a cyclodyalisis operation is presented to illustrate the summary listed above (Fig. 1)

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo Section on Oph thalmology and Otolaryngology May 8 1947

Operations for Glaucoma

The Iridectomy Operation—An eye, demonstrating most of the usual microscopic findings after unsuccessful iridectomy operations, shows generalized thinning of the fibrous tunic with edema and absence of the corneal epithelium. The operative wound is closed by dense connective tissue in which some of the iris pigment remains. The stump of the iris extends toward the center of the cornea and is adherent to it, showing that the synechia is just as extensive as it was before the operation was performed. In other words, the normal iris angle is not restored and the adhesions are not relieved.

Further study of the specimen shows considerable edema and round cell infiltration at the limbus which extends into the operative wound. The cornea is somewhat thinner than normal and the epithelium is undermined in the periphery, swollen and absent over the center. Bowman's membrane is intact except in the region of the limbus, where pannus is beginning to form. A membrane is forming on the anterior surface of the iris, and the endothelium is covered with a thin layer of round cells, fibrin and pigment par-

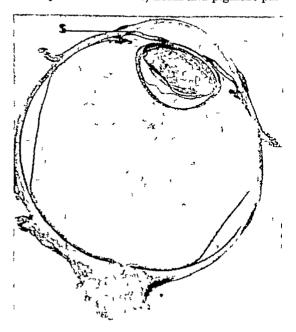

Fig 1 Section of an eye with chronic simple glaucoma after cyclodyalisis operation Anterior peripheral synechiae "S" remain undisturbed

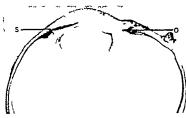

Fig. 2. Iridectomy operation 'O shows stump of iris extending toward apex of cornea and adhesions remaining. Anterior peripheral synechiae S on unoperated side.

ticles. The sclera is thinner than normal and shows little of importance (Fig. 2) The irus is characterized by atrophy, broad anterior periph eral synechiae and chronic inflammation. The ins stump extends far anterior to the filtration angle which has been closed by adhesions The membrane forming on the anterior surface of the uns, and contributing to the adhesions, has firmly scaled any possible connection with the normal drainage spaces. The ciliary body shows atroplus and inflammatory changes, and the choroid is flattened to a mere line by pressure and fixa tion. The retina shows destruction of the gangion cells, edema and cystic degeneration crystalline lens has been removed but its enlarged and forward-displaced capsule remains. A frag ment of ms hes on the anterior surface of the lens. Careful study of this specimen indicates that the iridectomy failed to create a new drain age channel and the synechiae were undisturbed The presence of inflammation contributed to the loss of the eye.

Ins Induston Operation —An eye removed after an unsuccessful tris inclusion operation shows atrophic uveal tissue in the operative wound, shallow anterior chamber, and definite lens changes. The fibrous tunio is distended and thunner than normal The epithelium shows signs of edema and bullous-like formation near the operative wound (Fig. 3)

A more intensive examination of the sections shows that the iris is included in the bleb and that filtration is possible. There is sufficient space between conjunctival flap and the iris for aqueous drainage. Unfortunately, the iris shows agas of chronic inflammation, and firm diagonal adhesions which unite the root of the iris to the base of the flap. Instead of acting as a filtration wick," the iris forms a firm band which dams the aqueous behind it. There is no relief from increased intra-ocular tension which accounts for

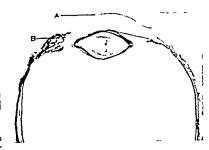

Fig 3 Iris inclusion B' in operative wound Separation of corneal epithelium "A" by bullous formation

distention of the globe and formation of bullae on the cornea

The crystalline lens has moved in the direction of the filtration cicatrix. It is saved from complete dislocation by a firm adhesion of the pupil lary area of the iris to its anterior capsule. The iris itself is almost diamond shaped in cross section and shows evidence of nuclear sclerosis Some of the contraction of the lens cortex is due to hardening agents. Displacement of the lens is a fairly common finding after operations for glau coma.

Most of the inflammatory changes in this specimen are in the vicinity of the operative wound There is congestion of the blood vessels with extravasations into the loose connective tissue. A small hemorrhage lies adjacent to the ciliary body Diffuse lymphocytic infiltration and fi brotic changes complete the picture. The iris on the aide opposite is drawn taut by its adhesion to the displaced lens. It is atrophic and diffusely infiltrated with lymphocytes. The ciliary body shares in the atrophic changes just mentioned

The eventual loss of this eye was due to the bandlike adhesion of the iris across the mouth of the operative wound displacement of the lens, distention of the globe, and bullous keratitis.

Trephane Operations—Eyes enucleated after unsuccessful trephine operations may be explained by the description of a typical 'failure" (Fig. 4)

The specimen shows the anterior chamber to be shallow the crystalline lens swellen and the operative wound closed by fibrous tissue. The cornea is irregular in thickness. The epithelium is slightly undermined by new blood vessels and connective tissue at the limbus. The stroma is moderately infiltrated in the periphery. Descemet's membrane is curied on itself near the operative wound and the endothelium is covered with a thin layer of fibrin. The operative wound is

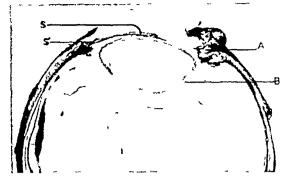

Fig 4 Unsuccessful trephine operation showing trephine wound "A", posterior synechiae "S", anterior peripheral synechiae "S", and crystalline lens "B"

closed by dense connective tissue containing fragments of pigment, lymphocytes, and new The filtering cicatrix contains blood vessels The iris is atrophic and is fresh hemorrhage closely adherent to the cornea and lens on the unoperated side That an iridectomy has been performed is shown by a part of the iris lying in the The ciliary body and the choroid show atrophic changes with congestion of the blood The retina is undergoing degenerative changes with diffuse hemorrhage in its innermost The crystalline lens shows cortical cataractous changes with nuclear sclerosis The lens is in close relation to the filtration wound

The loss of the eye was due to fibrotic changes in the wound and close approximation of the lens. The new channel was blocked and the closure of the iris was not relieved.

Conclusions

- 1 Failure of the indectomy operation may be due to persistence of synechiae and because the iris was not removed at its root
- 2 Iris inclusion operations may be closed by the iris itself
- 3 The trephine operation may become closed by fibrotic and inflammatory changes

Discussion

Harold E Wass, M D, Buffalo—Dr Payne's specimens indicate that the pathogenesis of the failures is subject to individual variations, not only of the eyeball operated upon but also of the ophthalmic surgeon as well

Since the publication of Dr Payne's second contribution to this aspect of ophthalmology, a similar study was undertaken in the Department of Pathology of the Buffalo General Hospital in an effort to ascertain how closely the evidences could be paralleled Although the amount of material studied was smaller, Dr Payne's conclusions were strongly substantiated

Fewest globes were represented in the failures which had some form of iridocorneosclerectomy Pathologic curiosities were not encountered at all, although they do occur It is well to insist on the

pathologic examination of all enucleated globes in order that they may be detected when present, for they will make almost any important intra-ocular operation hopeless, no matter what the precautions This is especially likely to happen if the patient is first seen with tension already greatly increased when there is no time for detailed clinic observation

Early in glaucoma, the pathologic picture is characterized by hyperemia and edema of almost every ocular structure Hyperemia and edema of themselves are considered by pathologists as temporary alterations in tissue structure and function They may subside without resulting in any permanent change of tissue metabolism However, if the process is not releived and progresses to the fixed stage, the tissue changes are irreversible true anywhere in the body but especially true in the eve Other tissue changes are superimposed on these and the final stages exhibit marked alteration in both histology and function. This is why surgery in early glaucoma, from a histologic point of view, should produce the best results. The hyperemia and edema are relieved before thay can pass into more complicated stages

Later in glaucoma, the surgery is not so satisfactory histologically because the degenerative processes are so fixed. Adhesions are broad and firm. The actual formation of new tissue has occurred, usually involving the angle, and the appearance of newly formed blood vessels is known to be a poor prognostic sign.

The failures studied at the Buffalo General Hospital were divided into two broad groups. The first group, those classed as physiologic failures, included globes lost from hemorrhage or infection. The second group was considered to be mechanical failures, for, while the hemorrhage and infection were not present, there was continued hypertension of the globe. The chinical findings in both groups were correlated, and it became apparent that failures of the first group bore no consistent relationship to the type of surgery performed, whereas the group of mechanical failures bore a rather marked relationship to the type of surgery performed, in that the anatomic factors favoring filtration were unsatisfied by the surgery

The importance of the time factor as a cause of failure was revealed in the series at the General Hospital in Buffalo Certain of the eyes, demonstrated by Dr Payne, as well as many in our own series, failed to respond to almost any operative procedure. Clinical investigation revealed that they were all glaucoma conditions which had existed for from five to twelve years in which surgery was delayed or had been advised and was refused.

The importance of Dr Payne's contributions are just as apparent to the ophthalmologist, whose interest is chiefly clinical, as they are to the ophthalmic pathologist. Every histologic change has its clinical counterpart. All these factors will be important when the final decision is made concerning the time for surgery and the type of operation to be performed on an eye with elevated intra-ocular tension.

THE CONSERVATION OF HEARING PROGRAM IN NEW YORK STATE

GORDON D HOOPLE, M D, Syracuse, N 1

UNDER the title "The Conservation of Hearing Program in New York State," there might well follow a detailed study of the number and variety of hearing difficulties that are to be found within the confines of the state. To this might be added a résumé of the facilities available for the alleviation of these maladies. The statistics for such a paper have been compiled and are a matter of record. This presentation will assume that these facts are well known and do not need repetition at the moment. This paper instead, is a plea for the support of the otolaryn gologists of our society for a new state-wide plan for the solution of some of the hearing problems of our entirers.

The need for such a planus obvious Until now most of us who are otolaryngologists have con cerned ourselves with the care of such hearing ailments as we ourselves can alleviate The disposition of those patients who have irreversible bearing loss is, for the majority of us, a matter in which we have little interest. Or if we have had the interest, most of us have done little about it It is time we did At this point it is quite proper to give credit to those of our number who have been proneers in the field of hearing problems and devoted much of their time and attention to them. Lacking the results of the efforts of these men, some of whom are still active and an example to the rest of us, we would hardly know where to turn for a program. They have set their sights and we can build on their foundations—if we will

I have said that the need for a plan is obvious To personalize the issue and be specific I would like to ask what you say to a patient whom you bave examined and found to have an irreversible hearing loss in both cars of more than 30 decibels in the speech frequencies? Your routine instructions most likely follow this pattern the names of some of the better hearing aid com panies Go to these, try out their aids and select the one best suited to you" I am going to con less right now that until September 1946 some such instruction was my custom. I said that and little more. Last September we started a Con tervation of Hearing Center in Syracuse to which we can refer patients for the trial and fitting of hearing aids. I no longer need to say what I did before. I could elaborate on this, but for the comings. This is not done to chide and scold, for I have been as guilty as anyone here How regularly do you mention the need for lip reading to such an individual as I have described? What do you do to see that such an individual makes contact with such instruction? What do you sug gest for a program of auricular training? Do you make the moves necessary for speech correction when hearing loss is responsible for slovenly speech? These would prove embarrassing questions if I were to ask now for your individual For most of you the real answer to answers these questions would include the information that such facilities as are needed for the solution of the implied problems in the above questions are not available to you and consequently, you do not open the subject.

Recently, through the efforts of the Committee on the Conservation of Hearing of the American Academy of Ophthalmology and Otolaryngology there was publicated a practical program for the average otolaryngologist which might be instituted by him in his office for the trial and fitting of hearing aids It was widely distributed, and I do not doubt that each of you read it with interest I did and found that for me it was not practical I do not doubt that most of you came to the same conclusion There is it seems to me. a vital reason why such suggestions have failed in the past to meet with popular approval. The selection and fitting of hearing aids and the institution of attendant remedial rehabilitation measures is something which requires the expenditure of a considerable amount of time Furthermore and this is the crux of the whole matter, the average otolaryngologist is so busy that he cannot devote the required amount of time to do the job, and consequently, he does not do it I think it is time we recognized this important fact, ac cented it, and began to attack this problem on a state-wide basis from an entirely different angle

Aural Rehabilitation

As a result of the war, a new phrase has crept into our terminology—aural rehabilitation. The medical corps of the Army and Navy, early in the period of hostilities, inaugurated a program which was given this name. It is felt by many that this endeavor was one of the best if not the finest, of all the activities of the medical corps of the services. Most of the technics used were known to otologists and allied personnel before their employment in this enterprise. These modalities

before. I could elaborate on this, but for the moment I wish to continue a review of our short

Presented at the latet Annual Meeting of the Medical Centry of the Blate of New York Buffalo, Section on Ophulancology May 9 1047

had been brought into vogue by some of the pioneers previously mentioned But it is fair to say, I think, that never before had all the methods been brought together under the use of such a variety of highly skilled personnel and employed with such effectiveness. The testing of hearing, the trial and fitting of hearing aids, auricular training, speech reading, speech correction, psychologic studies, and vocational guidance were correlated under a single program which brought about a satisfactory rehabilitation to the majority of those who were assigned to these centers a result of a questionnaire sent in 1945 to the rehabilitees of this program, it was found that, of those who were fitted with hearing aids, over 90 per cent were still wearing them after the lapse of more than a year This is a distinct advance over civilian experience and points out the value of a correlated service such as this was of you have visited one of these aural rehabilita-If you have not, you owe it to vourself and your patients to do so The nearest one to New York State is to be found in the Philadelphia Naval Hospital in that city There will soon be, if it is not already in operation, a similar center in New York City under the auspices of the Veterans Administration The record made by these centers is too significant to ignore

Recognizing that, individually, otologists cannot furnish adequately the service required for amelioration of this aspect of the hearing problem, it has seemed to some of us that it would be wise if we could adopt some of the features of the aural rehabilitation program of the armed forces and use them to meet the need which faces us in New York. If this were done, centers might be established in a dozen or more strategically located cities throughout the state and be so placed that no person who might need their services would be too great a distance from one of them. As these centers proved their worth, they could be enlarged in staff or in number until the requirements of the populace were met.

Civilian Centers

These civilian centers would not need all the elaborate equipment, nor all of the personnel of the military groups This would eliminate some of the elaborate service rendered the veteran, but, with a great saving in expense, the essential features could be retained Each center should be under the direction of an otologist this leadership there should be personnel trained in audiometry, speech reading, speech correction, auricular training, and the trial and fitting of hear-A few such workers are presently availing aids Courses given in several universities will soon make available others who can be secured to work on such a staff The number needed

would depend on the case load A minimum for such a center would be one otologist, one (to give a name) audiologic technician, and a social worker-secretary A complete staff would include two or more otologists, several audiologic technicians, an acoustic engineer, a psychologist, a vocational counsellor, a social worker, and one or more secretaries Such a large staff as this would be required only in the metropolitan districts A certain amount of equipment would be needed Space is an essential, including one or more soundproof rooms In addition, there should be enough instruments for a proper examination of the ears, nose, and throat should be added two audiometers, tuning forks, and other diagnostic aids A radium applicator should be included A typewriter and secretarial appurtenances would complete the essential equipment

It must be recognized and mention made of the fact that there are several such civilian centers in operation in the state under private auspices These have been in successful operation for some years and have proved their worth beyond ques-But it should also be noted that these are principally located in New York City where the above mentioned pioneers have enthusiastically pleaded their cause and have raised the necessary funds for the establishment of their clinics With the exception of Albany and Rochester, none of the other major cities of the state, to my knowledge, have embarked on such endeavors, and, consequently, much of the territory and a large part of the populace is unserved. If I have omitted any worthy local endeavors, it is due to my ignorance of them and not to intent

The mere outline of the personnel and equipment needs of such centers, as sketchily outlined above, brings to mind at once the fact that finances will be necessary to establish and maintain them If such a program, state-wide in scope, is to be inaugurated, how can this need be met?

I would suggest that existing facilities and services be utilized Most cities of any size have an outpatient clinic or free dispensary which would willingly house a center already in the employ of such a dispensary might be utilized at little additional expense taries and social workers might thus become immediately available An otologist on the staff of such an institution could be interested, and the addition of an audiologic technician or two would be all the additional personnel which would be The examining equipment of the dispensary could be used, so, in the main, all the additional requirements could be met by the building of a soundproof room, the purchase of an audiometer or two, and the procurement of a sufficient number of council-accepted hearing aids

for trial. The latter can be secured from the hearing aid companies without cost with the exception of one or two of these companies. Not all communities might be this fortunate but most would, and if so the main expense of such a center aside from the non recurring item of the mital equipment, would be the subaries of the audiology technicians.

Knowing the inertia of most communities toward the acquisition of additional annual expense items, such as audiologic technicians ralaries, your New York State Medical Society Committee for the Hard of Hearing and the Deafened has met several times and discussed ways and means by which provision may be made to meet such expenses. It has been felt by most of this committee that if public funds could be secured to cover these items, it would not be long before the state could be manned by a network of hearing centers. On the contrary it was felt that if it were necessary for each community to find means by which these charges could be met it would in all likelihood, be a matter of years before such a worthwhile and needed program could be established With this thinking in mind, several conferences have been held with officials of the State Health Department and State Rehabilitation Services It is not necesmry here to detail the delays which have occurred, postponing a hoped for favorable answer from these sources. Failure to receive funds from such suggested sources should not prohibit or even postpone this contemplated endeavor Funds from some source will be available, I am sure, for such a worthy cause It remains for us to uncover it, and then get to work

In the nebulous state of this program, no name has been given to these proposed clinics. I would respectfully suggest they be called Conservation of Hearing Centers. This is a positive program. Hard of Hearing Clinics or tren Hearing Clinics would not have the same

connotation and appeal

What can be accomplished if such a program is established? In the first place there would be a place in strategically located communities to which any person with impaired hearing could go and receive a competent examination, approprate medical and surgical treatment and, if the latter was not indicated rehabilitation measures which would insure to the individual a more useful poution in society There would need to be only a few locations where the greatest distance to be traveled to reach such a center would be more than 50 miles It may be argued that even this is too far to expect one to go for such help If this proved in practice to be true it is possible that traveling centers might be established Time would tell on this score. However the centers would be available, and we as otolaryngologsts, would not have the feeling of ineptitude which is ours when we say, in essence, to a patient "Go and find your own hearing aid and get along the best you can with it"

There is no reason why private patients with ability to pay for such services should not attend these centers. Their initial examinations and diagnoses could be made by the otolaryngologist of their choice and the decision made by him that a hearing aid was advisable. Payment for services rendered by the center would not be taking money from the doctor, for, save in very exceptional instances, he would have no further service to offer

Such a trend could and would have a deterrent effect on the rank commercialism which now surrounds the selling of hearing aids Some education would be necessary at first, but it would soon become known that facilities for the trial of aids was available to both poor and rich alike, and that in this trial because no aids would be sold or no rebates accepted, the commercial element would be eliminated. This would eradicate many of the grossly erroneous statements which are now made by many of the hearing aid salesmen. Recently the mother of a doctor came to my office to ascertain what she should do to be properly fitted with an aid She had visited one company, and its representative had told her that it was my custom to send all of my patients She then went to another company and its representative had told her the identical tale She came to me with this statement they both could not have been telling the truth ' It is this type of falsification which I feel could be stamped out by such centers or if not stamped out then greatly curtailed.

Such a program would stimulate interest in the broader aspects of the hearing problem among the otolaryngologists. A state-wide effort properly functioning could not help but be impressive and instructive. It might cause us to realize that this is the problem for all of us and not the problem for a few.

The really significant contribution which could be made by the adoption of such a program would be the enhancement of the welfare of the individual with impaired hearing. We must come to the acknowledgement, if we do not recognize it now that these people are not fully served throughout the state. In some localities yes but in large areas no. They deserve and need the help which such a program would render

It is significant that several states have adopted programs for the conservation of hearing not necessarily similar to the one presently advocated and are in the pursuit of their goals. Many of these are significantly successful. The Empire

State, the richest in the union, is without adequate measures to meet the wants of its people in this regard. As a group, we otolaryngologists should band together to urge measures which will put us not only in the running but in the van The final program may not be what I have proposed, but, whatever it may be, we should be active propagandists for its adoption and enthusiastic supporters of it when it has been adopted I urge your interest in such a goal

713 East Genesee Street

Discussion

Harry K Tebbutt, Jr, MD, Albany—Dr Hoople's paper is most timely and is a challenge to us all to go out and get busy. The responsibility for the care of these patients is surely right in our own laps, and I believe that it is certainly our duty to follow through and not let these patients drift about aimlessly and be exploited by many unscrupulous persons. We have all seen this happen many, many times and, as much as we disliked it, we apparently were unable to control it

In Albany in 1941, we organized a Conservation of Hearing Center, the first of its type to be organ-

ized in upstate New York.

At first we saw these patients in our regular ear, nose, and throat clinic, but soon found the arrangement unsatisfactory because of the noise and con-Therefore, we saw them after the regular patients when more quiet prevailed As the load increased, however, we found it necessary to transfer the other patients to another day and to see only hearing cases in this clinic We are now running 12 to 25 patients a morning and find this number about all we can handle for a thorough work-up, especially if aids are to be fitted Each attending man of the ear, nose, and throat group serves six months in rotation, and is assisted by our resident, assistant resident, an intern, and a group of fourth-year medical students

We rotate the attending men because none of them want to be left out of it, and the resident staff strongly resents any duties which keep it from attending the clinic By having the students attend, we feel we arouse their interest in the subject so that when they go out into practice, they will realize what is going on in this field and what can be done for the hard of hearing

We have been most fortunate in having as a member of our staff, a Miss Pauline Winkler Miss Winkler is a well-trained and exceedingly able teacher of a class of hard of hearing children in one of the city schools. She became interested in the project and encouraged us to start such a center to assist her in her problems with her students. She has worked with us for over six years as a volunteer

The Albany Hospital has provided all the necessary instruments for examining patients, including an audiometer and a relatively soundproof room. A radium applicator is also available for use

We make our own ear molds and seem to have no difficulty in having two or three hearing aid men come to the Center when we have patients to fit. The patients try two or three of the aids, and we help them to select the one which appears to suit them best. These patients return repeatedly for instruction and guidance. If they require hip reading, they are referred to the League for the Hard of Hearing, which has cooperated with us splendidly, or to the night classes for hip reading in one of our high schools

Our Center has the approval of the county Conservation of Hearing Committee, and some otologists and clinics are beginning to refer patients to us for assistance, in addition to many state rehabilitation cases from the Albany area. We are now known by most of the school physicians and nurses in the surrounding territory and treat patients from as far as a hundred miles away.

One of our big problems now is to find lip reading teachers in town and in the outlying districts Good ones are scarce, and an adequate number of good teachers are not being trained

We have been working with the State Education Department to start a course in the New York State College for Teachers on a graduate level, but there are many obstacles still to be overcome They all do not seem to realize fully the importance of such a project I would suggest that our state committee might take some action in this regard

MEDICO-SOCIAL STUDY PLANNED OF HUMAN REPRODUCTION

Both the medical and the social aspects of human reproduction will be the subject of a research project announced by Dr Haven Emerson, chairman of the National Committee on Maternal Health

The study will be under the direction of the National Research Council. Its main areas were outlined as follows

"(1) The physiology of and the factors con-

trolling conception, (2) the causes of sterility and treatment for infertility, (3) maternal and fetal physiology and clinical disorders developing during pregnancy, (4) the psychologic problems of marriage and the family relationships, (5) the population aspects of these problems, social and economic as well as medical."—Better Times, December 26, 1947

OTOSCLEROSIS ITS PATHOLOGY AND TREATMENT

Franz Altmann MD and DeGraaf Woodman MD, New York City

(From the Department of Otolaryngology Columbia University College of Physicians and Surgeons and the Presbyterian Hospital)

OTOSCLEROSIS is a disease of the essecus labyrathine capsule which in the majority of instances involves both sides, although not always symmetrically. It is characterised histologically by destruction of the capsular bone in certain areas followed by the formation of new bone.

Otosclerotic foci are found in 80 per cent of the cases near the anterosuperior circumference of the oral window. In 15 to 20 per cent of these cases the focus extends into the stapedial foot plate causing a loss of motility of the latter, a so-called stapedial ankylogis.

Inasmuch as normal motility of the stapes is essential for normal perception of air borne sounds, any restriction of this motility will result in a decrease in the acuity of hearing

The complete ankylosis of the stapedial foot plate is often preceded by the formation of fibrous adhesions between the oto-clerotic focus and the anterior crus of the stapes. Foci located in the region of the round window are next in frequency. These are usually found along the lateral part of the attachment of the round window membrane. Foci are less frequently found in other areas such as in the stapedial foot plate itself (primary location) or in the cochlear capsule. All these latter foci do not cause any impairment of hearing.

The lining membrane of the middle ear usually shows little or no change from normal. Oto-clarists, however, may also occur in ears showing evidence of a coexistent active or healed suppurative outline media.

Symptoms

Deafness starting insidiously and progressing showly is the main clinic symptom of otosclerosis in many instances it is accompanied by head noise, in some by dizziness. In the great majority of cases both ears are affected, often to a different extent. The progress of the hearing loss is, as a rule not continuous but interrupted by sta longity periods of varying length

Great differences of speed are shown in its progression. In some cases the hearing is still fairly good after many years, whereas in others a high degree of deafness develops within a relatively abort period of time. Retention of a cer

Provented at the 141st Annual Meeting of the Medical Socentr of the State of New York, Buffalo, Section on Ophthalmalogy and Otolaryngology May 9 1947 tain level of hearing for many years is no guarantee for its continued maintenance, it may be followed at any time by a sudden deterioration from the fact that stapedial ankylosis occurs in only 15 to 20 per cent of the cases with a focus in the neighborhood of the oval window, or in about 12 to 10 per cent of all the cases of otosclerosis the conclusion can be drawn that only about 15 per cent of all the cases of otosclerosis are accompanied by deafness and can be clinically diagnosed, whereas 85 per cent will remain undetected throughout life.

Frequency, Sex Predilection Heredity

The disease is more than twice as frequent in women than it is in men occurrence is often found. It seldom starts histogically before the age of five years, and the clinical symptoms rarely become manifest before puberty. In our opinion in none of the cases in which otosclerotic foci were described in embryos can this diagnosis be proved. Pregnancy particularly the second pregnancy, and menopause often have an unfavorable effect upon the condition.

Although there can be hardly any doubt about the importance of the hereditary factor, the exact mechanism of the transmission of the disease still remains obscure. This is understandable if one keeps in mind that otosclerosis becomes clinically manifest in only 15 per cent of the persons affectod with the disease. The remaining 85 per cent in which no stapedial ankylosis has developed may, however transmit the disease in exactly the same way as the 15 per cent with ankylosis. Freedom from clinic symptoms can by no means be taken as proof of freedom from histologic otosclerosis Reliable genetic studies will not be possible until histologic series of the temporal bones of all the members of affected families are available, and at this time such a study seems to lie in the remote future.

Routine histologic examinations of temporal bones have shown that otoselerotic foci are present in about 10 per cent of all the adult whites and that the disease is about 8 times more frequent in whites than among the negro population in the United States From these findings the conclusion can be drawn that about 12 million people in the United States harbor otoselerotic foci in the temporal bones and that more than 1 500 000 of them show hearing defects resulting from this disease.

Secondary Involvement of the Perception Mechanism

In the beginning stages of otosclerosis, the hearing loss is of the pure conductive type characterized by reduced hearing for air-conducted sounds but normal hearing for bone-conducted Later on, a progressive involvement of the perceptive mechanism is noticed Its time of onset and its extent show considerable individual variations In some cases it does not exceed the amount found in the population at large in similar In many others, however, it is much more The cause of this so-called nerve demarked generation is unknown Most probably, it is not caused by the otosclerotic lesion itself nor by direct involvement of parts of the neural apparatus, a rare occurrence, but is only secondary to the lesion and the sequel of certain still undetermined conditions brought about by the presence of the The term "involvement of the otosclerotic focus perceptive mechanism" seems preferable to the commonly used "secondary nerve degeneration," because it is not known which part of the neural apparatus is actually involved

The cause of otosclerosis is still unknown As far as we know at the present time, it is a disease confined to the temporal bones without any evidence of an underlying metabolic, endocrine, or

other disorder

Treatment

Considering the pathology of the disease, one can easily understand that local or general treatment is useless Catheterization of the eustachian tube might help to clear up accidental tubotympanal catarrhs which often cause a temporary increase in the loss of hearing Massage of the drum membranes might bring some improvement of very short duration in the relatively rare cases with fibrous adhesions between the focus and the anterior crus but without complete ankylosis seems unlikely, however, that such procedures could bring any relief in cases with complete ankylosis or that any medical treatment could achieve even an arrest of the disease or any improvement of the condition Thus, until recently, one could only make the diagnosis, advise against useless treatment, and suggest the use of a hearing aid and lip reading

The uselessness of the conservative treatment had already been realized by von Troltsch who was the first to advocate surgical therapy of the disease ¹ Since the presence of two functioning windows in the lateral wall of the labyrinth is regarded as essential for the normal transmission of air-borne sounds to the labyrinth, and since the oval window is occluded in otosclerosis, it is easily understandable that the first surgical

attempts were directed at mobilization or extraction of the stapes, the latter procedure in the hope that a connective tissue membrane would replace the removed foot plate. The results, however, were usually unsatisfactory. In many instances it was found technically impossible to remove the stapes. In others, in which the removal had been successful, secondary infection of the labyrinth or bony closure of the opening was the cause of failure. Therefore, the method was rejected by the leading otologists of that time

Others made labyrinthine fistulas into the promontory in the immediate neighborhood of the oval window, but also without permanent success Barany was the first to create the fistula in a semicircular canal 2 He chose the posterior vertical canal, Jenkins the lateral canal 3 Both investigators achieved only temporary improvements in hearing Holmgren, continuing these experiments, studied the problem for many years 4 He made fistulas in each of the 3 canals, sometimes in two of them simultaneously, and covered the fistulas with various kinds of tissues in order to prevent the closure His results were much better than those of the preceding authors but still far from satisfactory Sourdille worked out a technic with which for the first time fistulas were made into the lateral semicircular canal which remained open for more than five years 5 Sourdille's "tympanolabyrinthopexy" consisted, essentially, of making the fistula and covering it with a plastic skin flap continuous with the tympanic The procedure did not gain general acceptance, mainly because of the several stages, each separated from the other by months of convalescence

Lempert, using the principle of Sourdille's operation, improved it by making it a onestage operation which he named the fenestration operation 6 It consists, essentially, of removing part of the nonfunctioning ossicular chain, making a new labyrinthine window above the obstructed oval window, and connecting the drum membrane to this window by means of a plastic skin flap from the ear canal In the completed operation the vibrations of the drum membrane are now carried directly to the new window without the intervention of the ossicular chain the hearing with this reconstructed conducting mechanism is never entirely up to normal, extraordinary improvements and restoration of practical hearing have been achieved modified his method several times, the most important modification being the shifting of the position of the window from the lateral canal forward to what he calls the surgical dome of the vestibule ("nov-ovalis technic")7 This change in the position of the fistula reduced the tendency to secondary bony closure of the fistula considerably He also tried to achieve a further reduction by inserting a platinum indium frame or, lately, a small cartilaginous stopple, into the fistula, but these methods have found very few followers.

Animal experiments and the analysis of the histologic findings in human fistulas by Altimann have shown that infection and hemorrhages in the area of the fistula, trauma to the andosteum within the labyrinth, and bone chips left behind are the most important factors that promote bony cosure of the fistula. The enchondral layer of the capsule responds to trauma less rapidly with new bone formation than the periosteal layer Epithelium on the outer surface of the fistula particularly stratified squamous epithelium, exerts a retarding influence on bone formation

In accordance with most of the other authors we are using at the Columbia Presbyterian Medical Center the nov-ovalis technic without stopple and, as a rule, with the endaural approach have given up the complete exenteration of the pneumatic cells of the mastoid, because it makes the operative cavity unnecessarily large and thus prolongs the time required for the complete epithehalimtion of the cavity Secondary infection of the remaining cells has never occurred, possibly because of the prophylactic chemotherapy which is given for the first ten postoperative days (30 000 umts of penicillin intramuscularly every three hours) Particular care is taken to remove the periosteal bone in a wide area around the fistula, to remove carefully the bone chips to avoid trauma to the endosteum within the laby noth, and to thin out the tympanomental flap

As anesthesia, we have been using sodium pentothal. Ether should be avoided because it causes hyperemia and, in addition, makes the use of electrocautery impossible

Selection of Cases

Suitable for the operation are patients with good nerve function Since we are mainly interested in the patient's ability to understand speech, we pay particular attention to the so-called speech range between 512 and 2048 double vibrations. The hearing lose for bone conduction should not ex ceed 20-30 decibels because the bone conduction as a rule, remains unchanged even after a successful operation, and the hearing for air conduction can be expected to improve only up to the level of hear ing for bone conduction Since a hearing loss of up to 30 decibels for air conduction causes very little inconvenience at conversational distances, a hearing improvement up to and above this level would bring restoration of practical hearing Any improvement falling below this level would in many instances be unsatisfactory no matter how great the actual hearing gain in decibels

Age has nothing to do with the selection of a case for operation provided the patient is in good general health. However, in not many cases over fifty years of age and in very few over sixty years is the perceptive mechanism functioning well enough to make the operation worthwhile. If at that age the perceptive mechanism is still good we are evidently dealing with a bonign form of otosclerosts, and the question arises whether a hearing aid would not be more advantageous for the nation than the operation

Complications

The operation does not endanger the patient's life any more than any other major operative procedure. Postoperative infection has been kept down to a minimum by prophylactic chemotherapy for the first ten days after operation. The only more serious complications are facial paralysis, which is, as a rule, of a transient nature and perichondritis of the auricle which may lead to a deformity unless extensive through and through incisions for proper drainage are made in time.

Postoperative Course

After the operation the patients are dizzy for a few days but they are, as a rule able to be out of bed on the fifth postoperative day or even earlier and are discharged from the hospital on the tenth The dizzness usually disappears com pletely after a few days, but in some instances may persist for a few weeks or even months particularly on sudden turning movements of the head and when bending down. The epithelialisa tion of the operative cavity is in most instances completed within two to three months, particu larly if only an incomplete mastoidectomy has been performed Sometimes the epithelialization 15 delayed much longer by the formation of granu lations, and an annoying discharge may persist for some months

The hearing immediately after the opening of the labyrinth is considerably improved, but within one to three days after the operation it may drop down, sometimes even to a much lower level than that noted before the operation drop in hearing is caused by a labyrinthine irrita tion, a so-called serous labyrinthitis which usually subsides within ten to twenty-one days after its onset, after which the hearing returns rapidly to the previous high level. In certain cases, how over, the serous labyrintliitis causes more severe or often irreparable damage to the organ of Corts In that case the hearing improves at a much glower rate within two to six months or to a limited extent in the low tones only with the high frequencies remaining depressed. In some cases the hearing does not improve at all and may

remain even worse than it was before the operation In all such cases the results are unsatisfactory in spite of the presence of an open fistula

Among the factors responsible for the labyrinthitis is postoperative infection of the wound, which can be kept down to a minimum by sterile technic and prophylactic chemotherapy. But aside from that, blood and serum escaping from the undersurface of the tympanomeatal flap into the perilymphatic space may play an important role, causing an aseptic inflammation

The hearing improvement, apparent after the effects of the postoperative serous labyrinthitis have been overcome, is not always permanently maintained because of the tendency of the fistula to secondary bony closure This tendency is most acute during the first few months after the operation, later on, the osteogenesis becomes less About 85 per cent of the fistulas and less active that close do so within the first year after operation and only 15 per cent during the second year (Shambaugh) After that time all osteogenesis, as a rule, has ceased, and an open fistula with hearing improvement may be regarded as almost permanent The tinnitus often disappears after opening of the labyrinth and in many instances remains absent as long as the fistula stavs open very often returns when the fistula closes.

Evaluating End Results

It is difficult to get exact data about the permanent results of the operation Many of the figures given in the literature seem too optimistic This is mainly due to the fact that only a few of the available statistics report the average hearing results two or more years after the operation, and some report the average hearing gain for the conversational frequencies in decibels regardless of whether this improvement has brought about restoration of practical hearing or not We agree with Lempert that such a computation is misleading and does not permit a true evaluation of the results Instead, the cases should be divided into the following four groups

- Satisfactory rehabilitation for social and economic purposes, if the hearing was improved to the 30 decibels level or higher for the conversational frequencies 512, 1024, 2048 decibels, allowing only for the normal variable of 5 decibels of audiometric testing
- 2 Partial rehabilitation, if the hearing was improved but did not reach the practical 30 decibels level in all the conversational frequencies. Many of these patients, however, particularly those with marked improvement at 2048 double vibrations, are, subjectively, highly satisfied with the result of the operation.

- 3 No change in postoperative hearing
- 4 Postoperative deterioration of hearing

Even when one adopts a conservative attitude, one is justified in assuming that, in suitable cases, there is a 60 per cent chance, at least, for permanent restoration of practical hearing. This is confirmed by the results in cases which were operated upon by us at the Columbia Medical Center one year ago or longer.

In about 35 per cent there is a less spectacular, although sometimes still satisfactory, improvement, or no improvement at all. If this is due to a secondary bony closure of the fistula, a revision can be performed, and the newly formed bone removed. In many instances this will result in a permanent complete rehabilitation. If it is, however, due to the after-effects of a postoperative serous labyrinthitis, no correction is possible. In all such cases the patient is still able to wear a hearing aid on the operated ear.

In about 5 per cent of the cases the hearing gets worse or becomes entirely lost. These cases are regrettable, but one should keep in mind that the operation is generally done on the more affected ear and that very often otosclerosis leads eventually to a marked loss of hearing.

It is now believed by some authors that a successful operation stops not only the progressive loss of hearing for air-conducted sounds but also the secondary changes in the perceptive mechanism This is deduced from the observation that the hearing in the nonoperated ear continues to deteriorate while it remains unchanged for air conduction as well as for bone conduction in the operated ear Definite confirmation of this assumption would be of the utmost importance and would drastically change our present operative indications The fenestration would then become advisable in the great majority of all the cases of otosclerosis with a progressive hearing loss instead of just those with a practically intact perceptive mechanism In cases in which the operation would not restore practical hearing, it would at least prevent its further deterioration and would assure the patient of a permanent partial rehabilitation which, if necessary, could be further improved by the use of a hearing aid

Operation Versus Hearing Aid

A good hearing aid will give, in not too far advanced cases of otosclerosis, as much or even more sound amplification than a successful operation. However, it does not eliminate the noise, and there will always be some sound distortion which makes it a poor substitute for normal hearing. For that reason many patients who already wear an aid want to have the operation and are much more satisfied with a successful operation than they were with the hearing aid. The most

senous objection against the use of a hearing aid in operable cases is the fact that the aid fails to stop the progress of the disease. The more the disease advances, the less useful the hearing aid becomes but at this late stage the operation has already become impracticable, and the opportunity for permanent full rehabilitation has been lost. A hearing aid can be an important help in cases in which the operation has achieved only a partial rehabilitation

Pregnancy and Otosclerosis

Pregnancy often has an unfavorable effect upon the hearing in otosclerosis. For that reason many otologists advise women suffering from this disease not to have any children fenestration operation has changed our attitude toward this problem. If pregnancy occurs in womer who were not operated upon the hearing should be carefully watched If it deteriorates, the fenestration operation is performed by some surgeons even during the earlier part of pregnancy or shortly after its termination

Advising against pregnancies for eugenic rea sons appears of doubtful value Only 15 per cent of the persons afflicted with otosclerosis show reduced hearing, the other 85 per cent who have normal hearing remain undiagnosed and may nevertheless transmit the disease as mani fold cases do

Under these circumstances, there is no hope whatsoever of eradicating the disease by even the most drastic eugenic measures, but, fortu nately otosclorosis has lost much of its stigma through the possibility of successful surgical treatment of the disease

Summa-y

In spite of the remarkable progress which the ptosclerous research has made in the last fifty years, many problems remain unsolved most important of them is the cause which is still as puzzling as over Only after a complete clarification of its cause can we hope to find the means for prevention of or an actual cure for otosclerosis

Although the surgical treatment is only a pal liative procedure which does not climinate the disease its significance can hardly be overesti-Without undue evaggeration it might be said that the successful development of this opera tion is the greatest achievement in this special field of otology since the introduction of the calone vestibular tests by Barany about forty vears ago 10

The fenestration operation not only restores the hearing to a large group of patients but also lins greatly stimulated the interest of the otologasts in the problems of the physiology of hear ing in general It is to be hoped that through an intensified collaboration between clinicians and physiologists methods will also be found to improve the hearing in other types of deafness which up to the present day are still regarded as meurable

THE TREATMENT OF INTRINSIC CANCER OF THE LARYNX

JOHN D KERNAN, MD, New York City

(From the College of Physicians and Surgeons, Columbia University)

THE PRESENT discussion will deal only with intrinsic cancers of the larynx and their treatment. Ninety-five per cent of these cancers arise on one of the vocal cords.

The principles governing the treatment of cancer call for (1) the complete removal of the primary growth, and (2) the removal or destruction of all possible lymphatic involvement. In connection with early intrinsic cancer of the larynx, only the first of these requisites is applicable. Since the vocal cords are poorly supplied with lymphatics, wide removal of the primary growth is sufficient to effect a cure. The lymphatic fields, unless these are palpable nodes, need not be regarded.

Two methods of treatment are at the disposal of the surgeon, radiotherapy by means of radium or x-rays, and surgery

Radiotherapy

The use of radiotherapy in cancer of the larynx is based on the power of radium and x-rays to destroy the living cells. Cells near mitosis and tissues in which the cells are dividing frequently are believed to be especially sensitive to irradiation. Most cancer cells are of this type and as such are more readily destroyed than normal cells. If their resistance to radiotherapy approaches or equals that of the surrounding normal cells, the cancer may not be destroyed without destroying the surrounding cells. Consequently, no radioresistant cancer, situated in a vital area, can be justifiably treated by radiotherapy

Radiosensitivity and radiocurability are not always synonymous. A superficial cancer, even though not very radiosensitive, can be cured, because a sufficient dose can be delivered to it without harming the surrounding tissue. On the other hand, a radiosensitive tumor, if infiltrating, may not be curable by irradiation, because of the impossibility of delivering a lethal dose to the cancer cells without harming the circulation and lymphatic drainage to such a degree as to leave the organ an easy mark for infection and necrosis

Irradiation by radium or x-rays has hitherto only been condemned by laryngologists. The line of reasoning was as follows since 96 per cent of laryngeal carcinomas are of a rather well differentiated squamous cell type, they are not, as a rule, radiosensitive. In incipient or doubtful

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Oph thalmology and Otolary ngology May 9, 1947 cases, the reaction to radium treatment may obscure the clinical picture, making it impossible to estimate the extent of the disease or to complete the diagnosis. In reply to this, it may be said that no treatment should be started until the diagnosis is complete. Radium or x-rays may produce marked recession of the disease, even to the point of apparent disappearance. On reappearance, the same reaction to radiotherapy may again be brought about but to a less marked degree, and so on until the growth is completely radioresistant. Surgery cannot then be used, for the wound will not heal

These objections no longer hold true to this degree. In recent years rapid improvement in the technic of \(\tau-\text{ray}\) therapy has been made, so that apparently many of the former difficulties have been overcome. When radiotherapy is successful, the result is a larynx, intact and without deformity. No surgery can produce such a result. In view of such perfection in results, the claims of radiotherapy cannot be lightly dismissed, and surgeons should cooperate, wherever possible, to ascertain the indications and limitations of its use

Radiotherapy has an additional advantage in border-line and extrinsic cancers in which the lymphatics are probably or definitely involved. The fields of radiation may be so arranged that not only is the primary growth treated, but the lymphatic drainage is covered at the same time

Radiotherapy in the United States is largely confined to the use of x-rays. The claim is made that x-rays will do all that radium will do and is more convenient to apply. X-rays are more generally applicable. In special cases, however, such as recurrences in the lymph nodes, radium needles may be used. The decision in these cases should be left to the radiotherapist, since the laryngeal surgeon, unless working in a cancer hospital, will not be sufficiently familiar with the details of radiotherapy either to select cases or to carry out the meticulous treatment.

X-ray therapy is readily accessible, and, when correctly given, is just as successful as application of radium. The technic or x-ray therapy is constantly being improved, and it is possible that in the future it may replace surgery. The favorable cases are those in which the growths are superficial, have a tendency to sprout into the larynx, and involve no vital tissues. These are also cases in which surgical treatment is most favored.

The choice between radiotherapy and surgical treatment of caronioma of the larynx will at times be difficult. The medical profession and oven the latty are so much on the lookout for early cancer of the larynx that extremely early cases are now seen quite frequently, whereas in former years they were seen only rarely. Early superficial cases undoubtedly have been cured by radiotherapy and, considering the perfection of the result one is strongly tempted to adopt this procedure in these early cases.

The most recent statistics are decidedly favor able. Lens at the Presbyternan Hospital reports 8 five-year cures out of 10 cases of vocal cord tumors treated ¹. This record is about the same as that obtained by laryngofissural removal. In all he has treated 40 cases of vocal cord carcinomas and 110 cases of all types, and has attained 30 five-year cures the most successful of which have been those of the vocal cords. Pyriform tumors on the other hand, give the poorest results

Cutler of Chicago recently reported a series of 118 unselected cases with a five-year cure rate of 42 per cent. His results in early cases treated with radiotherapy were equally as good as those in laryngofissural removal

Surgical Treatment

These early growths may be removed by intra laryngeal dissection or by laryngofissure

Preparation for Operation —All surgical operations on the larynx should be preceded by the most careful proparation of the patient. This preparation includes hospitalization of the patient for several days or a week, careful exammation of the pulmonary, circulatory and urmary systems, blood chemistry analysis with removal, if possible of abnormal constituents from the blood stream. The mouth and teeth also should receive the most careful attention

All surgeons try to follow certain principles in order to avoid complications, the most dangerous of which are postoperative hemorrhage and post-operative pneumona. Surgeons vary their technic to a considerable extent but all carry out most careful hemostasis and protect the lungs from aspiration of blood

Every patient before operation should receive about 100 000 units of penicillin daily in divided does for several days. This will greatly diminish postoperative complications and allow primary bealing within a week in a large number of cases

Anethesia — Preliminary medication should be bed with caution, as morphine or other sedatives interfere with the cough reflex, which is such a powerful protection to the lungs

Blocking of the cervical plexus is used extensively in Europe In fact, Hamberger and Diamant state that most operators use that method. A number of major operations on the larynx have been performed at the Presbyterian Hospital, New York City using this method the injection of novocain and adrenalin along the border of the sternomastoid muscle on either side then in the midline along the course of the incision. This has been very satisfactory. There are dangers attached to the procedure, however and only a skilled anesthetist should employ it

The majority of American surgeons prefer general anesthesia, contending that only with this anesthesia is it possible to secure the quiet surgical field necessary for careful and accurate work. English surgeons prefer chloroform for its quicker effect and less irritating quality. Others prefer ether, given either by inhalation or by rectum Avertin by rectum or sodium pentothal intravenously have been used as foundation anesthesia, re-enforced by either local or general anesthesia by inhalation. The same objection may be raised against rectal anesthesia as against preliminary medication by morphine, i.e., the patients do not recover the cough reflex promptly Nevertheless whatever anesthesia is used, it will be safe only in the hands of an expert anesthetist

Operations -- (1) General anesthesia must be This limited used for intralaryngeal removal procedure is justified on the grounds that an early cancer involves only the epithelial layer of the mucous membrane and extends along the cord without infiltration The method should be used to remove only very small growths limited to the middle of the cord and not affecting its mobility In two instances, formerly reported, the present author has had the expenence of completely removing small growths at biopsy 4 In one of these cases, although the tissue removed was evidently cancerous, the cord healed smoothly, and there was no recurrence of the growth. In the second case sections of the cord removed after a posi tave biopsy, showed no malignancy. A third case, more recently seen repeated the experience of the first.

Lynch originated this operation and reported 9 cases, of which only 3 had had recurrences at the time of his report. This is a larger percentage of recurrences than should occur after a well performed condectomy. LeJeune, who has continued the work of Lynch, reports a larger series of cases with better results.

The larynx is exposed with the suspension apparatus. Then, the growth is cut about and removed, the incision being well away from the edges. The raw surface may be lightly touched with a coagulating electrode. The results in the successful cases as to function can be compared to those attained by radiotherapy. Careful observation will detect any recurrence at which

time a more radical operation may be performed, since the cartilaginous box which confines the neoplasm has not been injured

A great deal depends on the degree of malignancy Those graded #1 need only close removal, those of greater malignancy must be removed more extensively

(2) A laryngofissure is merely an incision into The more proper term would be the larynx partial laryngectomy by the laryngofissural route Laryngofissural removal gives its best results with early intrinsic laryngeal cancers, limited to the central area of one cord and not yet affecting the mobility of the cord Decrease of mobility of the cord signifies that there has been penetration of the cord itself and the muscles controlling its movement Fixation of the cord means that the arytenoid region has been reached by the growth When this occurs and especially when the anterior end of the opposite cord has been involved, the cancer is advanced

The significance of limitation of mobility is illustrated by Dr St Clair Thomson In 37 cases where the cord was mobile, 84 per cent three-year cures were obtained, in 20 cases where the movement of the cord was impaired, 75 per cent three-year cures were obtained, and in 9 cases, the cord was fixed, and only 44 per cent cures were obtained

When the aryepiglottic fold, epiglottis, or subcordal region have been invaded, the case is less suitable for attack by the laryngofissural incision. The two reasons for this are the great probability that the thyroid membrane or the cricothyroid membrane has been penetrated and the subcutaneous tissue invaded, or the probability that the region of lymphatics has been reached and lymphatic invasion may have occurred

There is now a tendency among laryngeal surgeons to extend the indication for the laryngofissural operation Even when the cord is fixed or the subglottic region or the anterior commissure invaded, it may be possible to surround the growth and remove it entirely Only evident invasion of the ventricular band, the subglottic space, or the arytenoid region contraindicates such an operation Moreover, the operation may be followed by radiotherapy which will increase the chances of cure Of course, the more extensive the removal of tissue, the poorer the voice will be Yet, all patients prefer even a whisper to the esophageal voice or to no voice at all It must always be remembered that the more the indications are stretched, the greater the danger of recurrence and the fewer the chances of a later successful laryngectomy

The incision is made from the hyoid bone to the substernal notch and deepened through the soft tissue to the thyroid cartilages and trachea
It is

probably safer to divide the thyroid isthmus Care should be taken not to strip back the perichondrium from the thyroid cartilage. The interior of the trachea and larynx are anesthetized by injecting a few drops of 10 per cent cocaine solution between the tracheal rings and through the cricoid membrane The trachectomy tube is now inserted into the trachea well below the cricoid cartilage, if possible, through the third and fourth rings The next step is the splitting of the thyroid cartilage In the ordinary early case in which the growth is limited to one side of the larynx, this can be done in the midline by making an incision through the cricothyroid membrane, inserting a blunt-pointed, angled scissors up through the larynx, and dividing the cartilage and soft parts of the interior of the larynx with one The wings of the thyroid cartilage are then retracted and the growth exposed, care being taken not to lacerate or bruise the edges of the cartilages At this stage, protection of the lungs from bleeding is most important. This is done by packing the trachea above the tracheotomy tube with gauze, and by prompt removal of all blood and secretion through a suction tube in the hands of an assistant Excision of the growth is next completed The soft parts of the side of the larynx which presents the growth are stripped from the cartilage, care being taken to raise the inner perichondrium. This is done without difficulty except below over the cricothyroid membrane and above the edge of the thyroid car-However, since this procedure is not adapted for the removal of growths which invade the regions above and below the thyroid cartilage, no stripping there will be required

Excision of the growth is carried out so as to leave a surrounding free margin of tissue by making a straight vertical incision with scissors toward the arytenoid region above and below the growth, taking in, of course, the whole thickness of the tissue

These incisions are carried backward as far as is necessary to extend beyond the growth, at times to the arytenoid, then, the mass of tissue separated above and below is cut away with rightangled seissors by an incision running in the long axis of the body Hemorrhage must be carefully controlled One or two vigorous spurters will probably be found at the upper and lower margins of the excised area These should be seized with artery forceps and tied, either with ordinary ligature or a suture ligature It has been found that a special broad-bill forceps facilitates the tying of these deeply-placed arteries A bronchoscope is passed into the trachea and all blood The larynx is closed by carefully removed suturing the external perichondrium of the operated side to that of the unaffected side The

raw surfaces are powdered with sodium sulfadianne and the soft parts are closed in layers with out drainage

Postoperative Care

The patient is returned to bed and placed in a semirechning or sutting position section is carried out by passing a small catheter through the tracheotomy tube. Only in cases of extreme necessity may a bronchoscope be used The tracheotomy tube is left in place from twelve to twenty-four hours, since there will be a good deal of secretion from the trachea, and some blood, in spite of all care, may have escaped down ward. In a few hours, an attempt is made to give the patient sterile water by mouth. After a few trais he will probably be able to swallow without any of the water coming through the tracheotomy wound The patient is kept on sterile water for twenty-four hours, when a regular fluid diet may be given with solids gradually being added If all goes well, the patient should be out of bed in twenty four or forty-eight hours Should the feeding by mouth be found impracticable, a naml catheter may be inserted and kept in place as long as may be necessary Thus will rarely be required.

During the week immediately following operation penicilin should be continued. This will greatly diminish the danger of complications and promote healing.

The subsequent care of the patient consists, chefly, of the removal of the granulation tissue which forms in the larynx, and which can be kept under control by application of silver intrate through the direct laryngoscope or excision with laryngeal forceps. Healing will take place in two or three months. The voice after several months may return almost to normal, although in most matances some hourseness will perust. The vocal result depends on the remaining mobility of the arytenod. If this is preserved, a new vocal cord will form. Although large parts of both vocal cords may be removed a good voice will be the result, if both arytenoids move freely

Occasionally, the granulomas which form at the site of the excised cord may cause great anxiety as to whether or not they may be early returrences. They should be kept under careful observation. If benign, they will show a tendency to regress after a short time. If, however, the tendency is to grow, they should be removed and sectioned. If found to be malignant a prompt laryngectomy must be performed. If the edges of cartilage have been injured, the wound may require a long time to heal, with a fistula persuing externally, and excessive granulations forming internally. Usually, a small sequestrum

forms under the incision. Once it has been removed, the wound will heal promptly

The above-described operation is one which may be used in early cordal growths of small size Should the growth be more extensive calling for removal of considerable tissue in the arytenoid region or part of the opposite cord, variation in the technic must be used. The cartilage may be opened by a hand saw or an electric saw, carrying the incision down to the inner perichondrium taking the greatest care not to penetrate the interior of the larynx As many of the soft parts of the larvax are then strapped off the cartilage as may be necessary to get beyond the growth, wherever it is The interior of the laryn's is then opened through normal tissue taking care always not to cut through cancerous tissue as this greatly increases the chances of recurrence By this method of incusion of the cartilage and the supporting inner penchondrum, portions of both cords may be removed successfully as far back as the arytenoids. Some surgeons prefer to excise the growth by using the diathermy knife. Some, even though they do not use the diathermy knife. congulate the edges after the growth has been removed by sharp dissection

Certain surgeons do not use a tracheotomy tube as a routine measure but dispense with it whenever they feel it can be done with safety. It is probably better to use a tracheotomy tube in every case, since this makes it possible to control postoperative hemorrhage more easily by reopening the laryax and packing it.

Dr St Clair Thomson, who has been most successful in operating on intrinsic cancers of the larynx through the laryngofissural incision, ad vocates the removal of the thyroid wing on the To effect this the external diseased side perichondrium as well as the inner perichondrium is stripped back, and the cartilage, all except its posterior border is excised with the right-angled scissors. It is maintained that the interior of the larynx heals more quickly with the formation of less granulation tissue when this procedure is adopted Removing the cartilage is objected to on the grounds that the retained cartilage is a barrier to spread in case there is a recurrence On the other hand, successful secondary larynged tomies have been performed even when the car tilage has been proviously removed

In the case of anterior commissure growths, portions of both thyroid cartilages may be removed together with underlying tissue even to the extent of leaving scarcely any little laryngeal lumen. In such cases a permanent tracheal fistula must be retained but a whispering voice will be preserved.

The objection to these extensive partial re-

sections is that in the case of growths so large as to call for such procedures, very likely there will already have been invasion of the lymphatics or parts external to the larynx. It may be said that justice is not done to the patient in such cases, unless total laryngectomy is employed.

Use may be made of a laryngofissure as an avenue of approach for the insertion of radon seeds. In the case of growths too large to be removed, the laryngofissure, nevertheless, gives excellent visibility, and radon seeds may be placed accurately. Their number and strength are graded according to the size of the growth Some cures have been reported.

Advanced intrinsic cases with fixation of cord. invasion of one or other of the commissures, the ventricular band, or subglottic space should be treated by total laryngectomy Until recently one would have said that such cases should all be submitted to laryngectomy Radiotherapy. however, is undergoing rapid improvement Authors have reported cures approaching 50 per cent of cases which certainly matches the cures by If this improvement in x-ray therapy continues, the limitations of surgery will be narrowed For the present, however, laryngectomy should be chosen for the advanced cases, especially for the following reasons since the danger of radionecrosis has not yet been overcome, even where the cancer is completely cured, the condition of the patient may be so miserable that a laryngectomy must be performed to stop pain and sepsis, and when there is recurrence after radiotherapy, and a laryngectomy is performed, healing is hard to obtain, although not The author has seen several such impossible cases which healed after radiotherapy at the Presbyteman Hospital Any radiotherapy, however, complicates surgery

103 East 78th Street

Discussion

Maurice Lenz, MD, New York City—For the past seventeen years Doctor Kernan and I have had a joint monthly follow-up clinic for patients with cancer of the larynx treated either by surgery or x-ray. Those receiving roentgenotherapy between 1931 and 1941 were reviewed in May, 1946, and reported in the Journal of the American Medical Association, May 10, 1947. Of the 128 patients treated only by x-ray, 30 were free from clinical evidence of cancer five to fourteen years after the treatment. The main factors determining the result were extent and location of the cancer and, es-

pecially, invasion of the arytenoid cartilages and lymph nodes. Thus, the disease was chincally arrested for five to fourteen years in 17 of 40 primary cord cancers, and in 9 of 28 cancers of the epiglottis, while the treatment failed in all of the 26 cancers of the piriform sinus.

Among cordal cancers the extent of the cancer had a definite influence upon the result. Thus, all the 6 cancers limited to the anterior or middle of one cord got well. This also occurred in 4 of 6 cordal cancers with extension either to the anterior commissure or the opposite cord or band, and in 2 of 3 patients with cordal cancer partially fixing the arytenoids. Among 21, however, in which the arytenoid was completely fixed, only 4 were arrested, 9 of the remaining had clinically metastatic lymph nodes, and they all died

Among the 9 primary epiglottic cancers free from chinical evidence of the disease from five to fourteen years, 8 had clinically metastatic cervical lymph nodes and 11 fixed the arytenoids either completely or partially Chondronecrosis occurred in most cases of epitheliomas invading the epiglottis, including those which healed. It was also frequent in those epitheliomas invading the arytenoids, but here this complication was much more serious and partially accounted for the low cure rate.

It is our belief that roentgenotherapy in early cancer of the cords gives as high a cure rate and a better voice than laryngofissure

In cordal cancer completely fixing the arytenoids, and in subglottic involvement, laryngetcomy is more reliable. We do not object to a preliminary trial with roentgenotherapy if the patient understands that he may have to have a laryngectomy later should roentgenotherapy fail. Healing after laryngectomy in these previously irradiated cases is not delayed and may be done without the fear of necrosis, if the roentgenotherapy has been carried out slowly and carefully

A mere statement of roentgen dosage does not describe the care and accuracy used in the treatment. There is as much difference in roentgenotherapy in various clinics as in surgery. Only a continued, joint follow-up clinic can teach the person treating cancer of the laryny whether surgery or radiotherapy is preferable in a given case. The choice of treatment of a cancer of the laryny should be made jointly by a laryngologist and a radiotherapist, as either or both of these forms of treatment may be applicable to a particular case.

A STUDY OF SURGICAL MASTOIDITIS OCCURRING IN CHILDREN AT THE BUFFALO CHILDREN'S HOSPITAL DURING THE YEARS 1945 AND 1946

HERRMANN E BOZER Buffalo M D . New York

THREE YEARS ago Dr Walter Dean read a paper before the Southern Medical Association, entitled "Otitis Media Still Takes Its Toll" He declared that the object of his paper was to "amplify and atress an important field which is badly managed in practice" In this paper he reported that 3 5 per cent of all rejections in the draft were due to defects of the middle car He quoted statistics to show that in 1940 in this country there was one "ear" death in every 337 deaths This compared unfavorably to Paulson's figures of one death in every 303 in Copenhagen over 40 years ago

Surely, if one considers the morbidity and mortality arising from acute suppurative of its media and the hundreds of thousands of people suffering from impaired hearing due to this condition, then we must conclude that this is a very important and dangerous disease with many undesirable potentiallities.

The proper management of acute otitls media has been fairly well agreed upon among otologists. It may be presumed that the following points have become almost noncontroversual

1 It is necessary to carry out prompt diagnoss and observation by one trained to observe and intrepret the changes that occur in the membrana tympani during acute infection.

Early myringotomy should be performed when fluid is present in the middle car

3 Active treatment with chemotherapy and antibotics should be carried out when the disease us till a nucous membrane infection. Such treat ment should extend over a period of approximately seven days in most cases and no longer than fourteen days, if the infection has not responded.

4. Chemotherapy and antibiotics should not be used to 'cure' bone involvement in an attempt

to avert operation.

It is readily conceded that no matter how earn extly and skillfully the treatment may be rendered, a certain nonreducible minimum of complications will occur. In order to ascertain whether this irreducible minimum has been reached a study was made of 105 consecutive mastodectomics occurring during the years 1045 and 1946 in the Buffalo Children's Hospital. These two years were chosen because medical practice in

Presented at the 141st Annual Meeting of the Medical society of the State of New York, Buffalo, Section on Ophthalmology and Otolaryngology May 9 1947

this community had about returned to normal with the release of the many doctors from the armed services Thus, if any lack of proper and intensive treatment were shown in the care of these cases during the early stages of the infection. it could not be laid to the fact that war had ren dered inadequate the usual medical facilities The incidence of mastoiditis in the Buffalo Children's Hospital for the past few years has increased little although the number of admissions has increased markedly the incidence of mastoiditis being 1 to each 107 patients in the two years this series was studied, 1 to 108 admissions in the previous two years and I case to every 130 hospital admissions in 1940 and 1941 During the venrs 1945 and 1946 there had been no unusually severe enidemics of acute infections to make this series different from an average series.

The following tables give some statistics which show that the group studied corresponds to the average group seen in any large city hospital for children. It should be noted that a majority of the cases occurred in the first nine years of life, which is the usual incidence.

TABLE 1 .- Age Incidence

Age	Number of Cases
1- 3 years	22
4 6 years	25
7- 0 years	37
10-12 years	17
18-15 years	10
16-18 years	4

Table 2 shows the incidence of the pathologic organisms and this also is in accordance with the usual statistics. All outlures were taken from the mastoid cavity at the time of operation. The unsatisfactory cultures probably resulted from either the use of chemotherapy in some of these cases or to an error in technic.

TABLE 2.-ORGANISMS

Hemolytic streptococcus	62 per cent
Pagamococcus .	9 per cent
Rtanhylogocous aureus or miso.	13 per cent
Staphylococous aureus or misc. Unsatisfactory cultures	12 per cent

Table 3 shows the time elapsed from the initial symptoms of otitis media to the operation and is interesting in that 18 cases were operated on within the first week. This might seem rather high but all 18 were well advanced cases of surgical mastoidits due either to the parents of the children not being aware of the onset of acute

otitis media at the time, or to the masking of early symptoms by chemotherapy given sometimes for a preceding upper respiratory infection. The above remarks apply also to the 21 cases operated on during the second week of the disease

TABLE 3 - DURATION OF SYMPTOMS BEFORE OPERATION

Length of Time	Number of Cases
1st week	18
2nd week	
3rd week	$\begin{smallmatrix}21\\25\end{smallmatrix}$
4th week	
5th week and above	12 18*

^{*} Of which 9 were for acute exacerbation of chronic outs media and mastoiditis.

We have attempted to plot accurately the medical treatment of the acute otitis media before the case came to operation The records have been fairly accurate and indicate that only 43 per cent of the cases had any chemotherapy and of these, approximately 40 per cent had what might be called madequate therapy Only 5 per cent of the total number were given penicillin and of these patients only one received it for more than three days Four per cent of the cases received combined sulfadiazine and penicillin doses, and in only one of these 4 cases was the dosage adjusted properly The other 3 dosages were entirely inadequate, consisting of a few tablets of sulfadiazine from time to time and a day or two on oral penicilin

Table 4 indicates the time elapsed from the beginning of the disease to the time aural discharge was first noticed. This, too, is very interesting, because 26 of the 73 cases that had spontaneous discharge ruptured after the third day, 5 of the total number of cases required myringotomy, and 13 had spontaneous perforation of the drum after the seventh day. This in itself would seem to indicate either a considerable degree of indifference to the course of the disease or a lack of observation by the attending doctor.

TABLE 4 -Time of Beginning of Aural Discharge*

Day of Disease	Number of Cases	Remarks
Ist day 2nd day 3rd day 4th day 5th day 6th day 7th day	23 12 12 7 2 4 13	1 required later myringotomy

 $_{\rm ^{9}Up}$ to the time of operation, 10 cases had had no aural discharge

Table 5 shows the surgical management of the cases of acute otitis media which preceded the surgical mastoiditis and which the children had before entering the hospital. It is interesting to note that of the 18 cases, 12 myringotomies were performed seven days or later in the disease, and that only 3 were performed before the fourth

day This, coupled with the fact that ten cases shown above had had no aural discharge at any time so far as could be determined at the time of operation, would indicate that there was a very definite lack of awareness of the fact that the middle ear should be drained when it contains pus

TABLE 5 —DAY OF DISEASE THAT MYRINGOTOMIES WERE

	FERFORMED			
Day of Disease	Number of Cases	Remarks		
1st day 2nd day 3rd day 4th day 5th day 6th day	1 2 0 1 0 2	5 included in Table 4		
7th day	12	5 cases had spontaneous dis- charge which stopped		

It is to be remembered that all these cases were sent into the hospital with a diagnosis of surgical mastorditis and were operated on shortly after being admitted Of the 94 cases of acute surgical mastorditis operated on, 6 presented signs of early or threatened intracranial complications consisting of 1 case each of meningismus, meningitis, epidural abscess, Gradenigo's syndrome, cerebellar abscess, cerebellar abscess and pensinuous infection There were 2 deaths in this series, one, a two-year-old child with an aleukemic leukemia with broken-down, infected mastoid cells The second death occurred in a boy of seven who developed a cerebellar abscess Myringotomy had been performed on the seventh day after the onset of symptoms of acute otitis media He had had no chemotherapy, having been treated outside the hospital for sinusitis with penicillin nose drops

It would seem from the above figures that nearly half the cases that came to operation for surgical mastoiditis had not had what would be considered adequate treatment by the majority of the otologists. If we ask ourselves why an adequate course of treatment was not carried out, the following points may present themselves as possible reasons.

- 1 Acute otitis media is so very common in children that it is generally considered a very minor complaint and one that will take care of itself in a vast majority of cases. Thus, in many cases, aside from prescribing ear drops or aspirin, no other care is given until more serious symptoms develop.
- 2 Paracentesis is not performed promptly enough Too many cases receive no treatment until the aural discharge occurs spontaneously, as was shown in the above figures. Too often, paracentesis is considered as a nuisance more or less, since the child must either be given an anesthetic or forcibly restrained, with the result that the true criteria for performing paracentesis are not considered.

3 The disease itself does not seem to be considered sufficient cause for prescribing chemotherapy, and, if therapy is prescribed, it is rarely carried out long enough. This was demonstrated in the above figures.

4 Lack of frequent careful observation by a tramed otologist. If the case was under his observation, it seems difficult to believe that any otologist would permit over 10 per cent of his cases to come to operation without any history of aural discharge. It is, of course, true that a certain number of cases will give minimal symptoms which have been ignored, probably, without calling a doctor. Also, as proviously mentioned, the symptoms may be masked in those cases which received chemotherapy for upper respiratory infections.

The question now arises as to just what may be done to remedy this situation. Inasmuch as a vast majority of all acute otitis media cases are not treated by the otologist, it seems that the only thing to do is to foster an appreciation of the scriousness of the complications that may arise from this disease among the practicing physicians The only way to arouse interest in this matter is to teach medical men the facts before they go into active practice To accomplish this, more stress and interest might be given to this subject in teaching our medical students. As a rule this can be most easily accomplished during the teaching hours in a pediatric hospital, where the disease is commonly seen in the outpatient departments. It has occurred to us that very probably we otologists have not taken as active a hand as we should in teaching these students in the outpa tient departments and in the wards

It also seems desirable that we stress the importance of proper care in these cases to the interns, all of whom will be in active practice within a short time. If we can awaken the interns to the fact that they undoubtedly, will see many such cases and will be mostly responsible for preventing surgical mastoiditis, then perhaps they will have a keener interest in and appreciation of the cases when such cases are encountered in private practice. It seems that such efforts over a period of a few years, along with the adequate therapeutic methods that we now have could decrease the incidence of surgical mastoiditis appreciably

Discussion

Stnart L. Craig, M.D., New York City—Dr Bozer's well-presented and thoughtful study of 105 topes of surgecal mastoidits in children in a period of two years should give the otologist and the practitumer something to consider and act upon Dr Dean's paper which Dr Bozer quotes, is very revealing statistically in that it shows that mastoiditis and its sequelae have by no means been written off as causes of desability and death an idea generally necepted since the advant of more modern and advanced methods of treatment.

In the practice of otology in the large cities, among a class able to command the services of very com petent pediatrists or practitioners the incident of mastolidits has been markedly diminished and its complications reduced to a minimum. But among the less affluent classes where medical service is not sought or is casual the incidence is still high. In addition the fact that operative mastoids in private practice are comparatively rare while there is a relatively high percentage in the clinics shows the importance of early competent care.

There are several points in Dr Bozer's paper which I would like to underline Because chemotherapy and penicillin have proved so effective in controlling middle ear infection dependence is placed on the drug, and myringotomy or paracentesis have not been performed even in cases where there is frank bulging in the membrana tympani and fluid in the middle ear A paracentesis in my opinion is wase when there is definite evidence of fluid in the middle ear probably due to infection, and it lessens the chances of complications setting in and impair ment in hearing. Again where chemotherapy or penicillin is used, it should be given in sufficient amount to establish quickly and maintain a high blood level until the infection is under complete control Inadequate or sporadic doses of either of these drugs is confusing and dangerous. Again that the use of chemotherapy and penicillin should be instituted at the very beginning of the infection, when the invasion is confined to the mucosa, cannot be too strongly emphasized, since, in my experience they have proved to be ineffective after the mastoid cells contain frank pus We have found in practice that the use of sulfadiazine and sulfathiazole together increase the solubility and effectiveness of both and when the infection is resistant the use of penicillin and sulfa aimultaneously is advisable. All cases of chronic otitis media purulent should be under the care of a competent otologist. The majority if the infection is persistent should be operated upon. All cases of cholestentoms involving the masteid should be operated upon

Dr Bozer's recommendation of more training in otology for the practitioner and the intern is in my opinion, of the greatest importance and would solve the problem of those cases of otitis which are not diagnosed or are improperly treated in the early stages and would prevent those cases which are not referred to the otologist until ready for admission to the hospital for operation

With every student graduating from medical school having a reasonable training in a children eline or an ear clinic in totology with every graduating student fully equipped to evaluate the changes in the middle ear resulting from bacterial invasion with our present ability to control infection by the prompt and efficient administration of the sulfa drugs and peniellin, mastodists and its complications would become a steadily diminishing menace

Gordon D Hoople, M D Syracuse. Only one of

this series of cases which required mastoidectomy had an early myringotomy, (1 case within twenty-four hours of the onset of symptoms) Only about 20 per cent of the entire series had myringotomy. The remaining ears either ruptured spontaneously or had no middle ear discharge up to the time of operation. A majority of the 20 per cent had their myringotomy seven or more days after the onset of symptoms. These figures are most significant.

A number of years ago I studied the possible relationship between early myringotomy and haphazard surgical attention to drainage of infections of the middle ear in communicable diseases among the children of Syracuse I found that approximately 50 per cent of Syracuse's communicable disease patients are hospitalized. Having charge of the otolaryngologic service in the City Hospital, I insisted that all sudden fevers or pains in the ear occurring in these patients be investigated at once, even if they occurred in the middle of the night Myringotomy was to be performed at once if the indications were present. Thus, all hospitalized communicable disease patients were under otolaryngologics.

gologic control The remaining unhospitalized 50 per cent were not

The study was carried on over a ten-year period It was found that of the ears which developed suppuration after admission to the hospital, only 21 per cent went on to mastoidectomy. In contrast to this, it was necessary to do a mastoidectomy on 79 per cent of the ear cases which developed before admission to the hospital. (The majority of these were admitted to the hospital because they had ear infection and not because they had a communicable disease, and they can thus be grouped with the unhospitalized 50 per cent who had haphazard middle ear observation and care.)

I believe that if early myringotomy had been performed in each patient in Doctor Bozer's series a great majority of them could have been spared a mastoidectomy

FIRST INTERNATIONAL POLIOMYELITIS CONFERENCE TO BE HELD IN JULY

Official delegates from more than 60 foreign governments will be invited to participate in the First International Poliomyelitis Conference at the Waldorf-Astoria Hotel in New York City next July 12 to 17, the National Foundation for Infantile Paralysis, sponsor of the conference, has announced

The foreign delegates will be asked to present summarizations of the problems of poliomyelitis in their countries at a special session presided over by Thomas Parran, M.D., Washington, D.C., Surgeon General of the United States Public Health Service

Official host to the delegates will be Basil O'Connor, New York, president of the national foundation Hart E Van Riper, M D, Washington, D C, the foundation's medical director, has been appointed general chairman of the conference

The program is being arranged by a sevenmember advisory board which includes Irvin Abell, M.D., Louisville, clinical professor of surgery at the University of Louisville, Morris Fishbein, M.D., Chicago, editor of the Journal of the American Medical Association, David Lloyd, Ph D, New York, associate member of the Rockefeller Institute for Medical Research, Kenneth Maxey, M D, Baltimore, professor of epidemiology at Johns Hopkins University, Frank Ober, M.D, Boston, professor emeritus of orthopedic surgery at Harvard University, and Thomas Rivers, M D, New York, director of the Hospital of the Rockefeller Institute for Medical Research

In addition to reports on poliomyelitis research and treatment by professional authorities and panel discussions on the various subjects, there will be a scientific exhibit section, demonstrations of muscle testing and treatment procedures, and a film program

Coordinating this phase of the conference will be an advisory committee of Thomas G Hull, Ph.D, Chicago, director of scientific exhibits of the American Medical Association, and Charles F Branch, M D, Boston, director of scientific exhibits of the American College of Surgeons—A M A News, December 19, 1947

ANTEROSEPTAL INFARCTION

MAURICE A DONOVAN, M.D., F.A.C.P., Schenectady, New York

(From the Department of Cardiology Ellis Hospital)

THE use of precordial leads as an adjuvant toward a more clear understanding of certain eardisc problems is generally accepted now by most cardiologists. Wilson and his associates proncered the use of these leads in 1930 12 In that same year while discussing a paper by Dr E. P. Carter before the Association of American Physicians, Wilson stated, "By taking precordial leads, as well as the usual three leads much ad ditional information concerning the spread of the excitation process over the heart and also we beheve, regarding the final deflection of the electroeardiogram, may be obtained. It is hoped that much information may be gained from such leads in coronary thrombosis"

Wolferth and Wood recommended the use of lead IV in 1932 Although this lead IV was an anteroposterior lead that is no longer in general use, it is pertinent to the discussion that follows to quote from their article 4 "It is possible that lead Il may find a place in routine electrocardi

ography '

1

Various investigators have studied the application of these leads from both an experimental and cline standpoint, and a reasonably clear con cept has been evolved concerning the normal findings in leads of this type 16 The discussion relative to the best position for the indifferent electrode as yet remains controversial, but many are entisfied that good results can be obtained by any of the methods approved by the Committee of the American Heart Association and the Cardiac Society of Great Britain and Ireland One of the main points of disagreement, however is how many precordial leads should be taken and what clinic conditions should determine the type and number of these lends. The purpose of this paper is to stress the importance of a full set of precordial leads in all cases and by presenting eramples of anteroseptal infarction to emphasize their importance in the diagnosis of this con

There are many reasons why today, even in the light of the great advances in precordial electrocardiography individuals and matitutions are tontent to secure but one precordial lead com monly lead IV F The precedent of years is difficult to break in some instances Many feel that one precordial lead of thus type gives full informa tion, despite the fact that at best, there is poor correlation between the three standard limb leads and one or two precordial tracings In many in

stances a compromise results and such leads as CF 2, CF 4, and CF 6 are taken The fallacy of such a procedure will be appreciated when the importance of a comparison of each precordial lead with that immediately preceding and follow ing it gains wider acceptance Wilson et al state.

In normal subjects the R deflection steadily increases in height as the precordial electrode is moved from the first to the fourth position and then decreases as it is moved farther to the left The decrease in the height of the R and its eventual disappearance as the exploring electrode was moved across the right side of the precordium is a far more reliable sign of infarction than complete absence of this deflection in the first two or three precordial leads "*

Others believe it both a waste of time and expense to bother with a complete precordial study Not a few after taking these leads in a fair num her of cases and seeing only an occasional in stance in which additional information has been obtained by their use, give up this practice or try to pick the case in which they believe these leads will be of value Those who attempt this short cut eventually find that the case in which full precordial leads are most necessary is usually the one in which they have been omitted

When one considers the ease with which a full set of these leads may be taken coincident with the standard set the commercially available switches that may be incorporated in any type of electrocardiograph and the slight additional time consumed in their taking, it becomes clear that such leads add little labor at the time of the original tracing Since all improve diagnostic ability through repeated experience, the ability to recognize normal precordial leads, as well as borderline variations is a rich reward for any ad ditional work. Finally most cardiologists feel that the electrocardiogram remains relatively stable over long periods. Thus normal precordial leads may assume considerable importance when later compared with subsequent tracings of the same patient which show questionable variations from the generally accepted normal findings

Thus far precordial electrocardiography has been discussed in a general manner The further purpose of this paper is to show by citation of case histories with brief concise physical findings, that the use of a single precordial lead, namely lead IV F may work to the disadvantage of the pa tient. When the electrocardiographic findings are

this series of cases which required mastoidectomy had an early myringotomy, (1 case within twenty-four hours of the onset of symptoms) Only about 20 per cent of the entire series had myringotomy. ANTEROSEPTAL INFARCTION

MAURICE A DONOVAN, M D F A C P, Schenectady, New York

(From the Department of Cardiology Ellis Hospital)

THE use of precordial leads as an adjuvant Toward a more clear understanding of certain cardiac problems is generally accepted now by most cardologists. Wilson and his associates pioneered the use of these leads in 1930 1.2 In that same year while discussing a paper by Dr E. P Carter before the Association of American Physicians, Wilson stated 3.4B3 taking precordial leads as well as the usual three leads, much ad ditional information concerning the spread of the excitation process over the heart, and also, we believe, regarding the final deflection of the electrocardiogram, may be obtained. It is hoped that much information may be gained from such leads in coronary thrombous."

Wolferth and Wood recommended the use of lead IV in 1932 Although this lead IV was an anteroposterior lead that is no longer in general use, it is pertinent to the discussion that follows to quote from their article. "It is possible that lead IV may find a place in routine electrocardi

ography'

larious investigators have studied the application of these leads from both an experimental and cline standpoint, and a reasonably clear con cept has been evolved concerning the normal findings in leads of this type. . The discussion relative to the best position for the indifferent electrode as yet remains controversial, but many are satisfied that good results can be obtained by any of the methods approved by the Committee of the American Heart Association and the Cardine Society of Great Britain and Ireland 7 One of the main points of disagreement, however is how many precordial leads should be taken and what clinic conditions should determine the type and number of these leads. The purpose of this paper is to stress the importance of a full set of precordial leads in all cases and by presenting examples of anteroseptal infarction to emphasize their importance in the diagnosis of this con

There are many reasons why today, even in the best of the great advances in precordial electro-cardiography, individuals and institutions are content to secure but one precordial lead commonly lead IV F The precedent of years is difficult to break in some instances. Many feel that one precordial lead of this type gives full information despite the fact that, at best, there is poor correlation between the three standard limb leads and one or two precordial tracings. In many in-

stances, a compromise results and such leads as CF 2, CF 4, and CF 6 are taken. The fallacy of such a procedure will be appreciated when the importance of a comparison of each precordial lead with that immediately preceding and follow ing it gains wider acceptance Wilson et al state, "In normal subjects the R deflection steadily increases in height as the precordial electrode is moved from the first to the fourth position and then decreases as it is moved farther to the left. The decrease, in the height of the R and its eventual disappearance as the exploring electrode was moved across the right aide of the precordium 18 a far more reliable sign of infarction than complete absence of this deflection in the first two or three precordial leads "*

Others believe it both a waste of time and expense to bother with a complete precordial study. Not a few, after taking these leads in a fair number of cases and seeing only an occasional in stance in which additional information has been obtained by their use, give up this practice or try to pick the case in which they believe these leads will be of value. Those who attempt this short cut eventually find that the case in which full precordial leads are most necessary is usually the

one in which they have been omitted

When one considers the ease with which a full set of these leads may be taken coincident with the standard set, the commercially available switches that may be incorporated in any type of electrocardiograph and the slight additional time consumed in their taking, it becomes clear that such leads add little labor at the time of the original tracing. Since all improve diagnostic ability through repeated experience, the ability to recognize normal precordial leads as well as bor derline variations is a rich reward for any additional work. Finally most cardiologists feel that the electrocardiogram remains relatively stable over long periods Thus normal precordial leads may assume considerable importance when later compared with subsequent tracings of the same patient which show questionable variations from the generally accepted normal findings.

Thus far, precordial electrocardiography has been discussed in a general manner. The further purpose of this paper is to show by etation of case histories with binef, concise physical findings that the use of a single precordial lead, namely lead IV F may work to the disadvantage of the patient. When the electrocardiographic findings are

given undue consideration, they may give a sense of false security to the clinician. It is believed that the use of a single precordial lead is a hazardous procedure in the case of anteroseptal infarction, but that the diagnosis can be easily established when precordial leads from the right side of the heart and intraventricular septum are incorporated with the leads from the apex

The cases selected for presentation in this report have been chosen entirely on the basis of the electrocardiographic findings. They represent the day-by-day patients seen in a consulting office and hospital practice. The findings presented have been epitomized with the purpose of relating only the essential features.

Case Reports

Case 1—A. A, a 61-year-old white man, a minister by profession, was seen on April 17, 1946, his chief complaint being extreme fatigue. The history disclosed he had a cardiac upset on February 20, 1943, which kept him in bed for one month. He gradually resumed his work and one year later had a less severe attack, necessitating one week of complete rest. Thereafter, he was able to become more active gradually. Physical examination, with particular reference to the heart, showed the sounds regular and of good quality, with no murmurs detected. There was no evidence of enlargement nor signs of congestive failure. The blood pressure was 134/78 (Fig. 1)

Case 2—B H., aged 71, a retired laborer, was seen on June 19, 1945 The chief complaint was frequent nocturnal dyspine of ten weeks' duration, which forced him to sit in a chair the greater portion of each night, usually beginning about 1 A M. His past history disclosed nothing of interest except that he had chronic indigestion for several years and took rather large quantities of baking soda daily. Physical examination, with particular reference to the heart, showed marked left ventricular enlargement, gallop rhythm, and a harsh (Grade 4) systolic murmur at the apex, with wide transmission. There were numerous moist rales at both bases but no evidence of failure of the right ventricle. The blood pressure was 124/82 (Fig. 1)

Case 3 -I G, aged 51, a mining engineer, was examined on November 11, 1946 He was doing strenuous physical work and, in addition, spending He commuch overtime in planning projects plained of nocturnal dyspnea of six weeks' dura-The attacks developed between 3 00 and 6 00 A u and were controlled in about one-half hour by sitting on the edge of his bed The history disclosed that on July 5, 1944, he had an attack of severe substernal pain, associated with weakness, profuse sweating, and the feeling of impending death He rested for three weeks and then gradually resumed his former activities During the six months preceding his present examination, he noted increasing exertional dyspnea, easy fatigue, and some weight loss Physical examination, with particular reference to the heart, showed the sounds regular, of good quality, with no murmurs detected. There was no enlargement present. There were no basal rales nor other signs of congestive failure. However, the vital capacity was considerably reduced and the sodium decholin circulation time was twenty-two seconds (Fig. 1)

Case 4-B C, an active 65-year-old physician, presented himself on November 3, 1945, with the complaints of dyspnea on slight exertion, tachycardia, easy fatigue, a developing mass in the upper abdomen, and evening ankle edema There was no history of previous or present chest pain. Careful questioning elicited the fact that three months previously, while carrying two heavy suitcases up two steep flights of stairs in a summer hotel, he was able only to make his room before being seized with sudden extreme weakness and profuse sweating The attack lasted about fifteen minutes and thereafter he was normally active He was not unduly concerned by the incident, and only with the onset of the presenting symptoms did he consider the possibility of some cardiac problem Physical examination, with particular reference to the heart, showed a rate of 120, regular, with the sounds somewhat distant and no murmurs present There was no enlargement Numerous moist rales were present at both bases The neck veins were not distended, the liver enlarged four fingers' and the legs showed 2 plus pitting edema to the knees The blood pressure was 98/80 The sodium decholin circulation time was twenty-eight seconds and the vital capacity greatly reduced Despite advice to take a few weeks' retirement, this physician continued to carry on an active practice and on digitaline nativelle, aminophyllin, and a low-salt diet made an uneventful recovery (Fig 2)

Case 5—P G, aged 44, an insurance salesman, was seen on July 3, 1946. His history showed that on May 15, 1946, he noted some difficulty in breathing while climbing one flight of stairs. This passed quickly, and after a short rest he resumed his daily activity. The next morning on arising he noted a sense of constriction in his chest, felt very weak, and became pale. He did not perspire. His attending physician kept him at bed rest for one month, and then he gradually became more active. Physical examination, with particular reference to the heart, was entirely negative. The blood pressure was 144/82 (Fig. 2)

Case 6—K. K, aged 59, a housewife, was seen at home on June 21, 1946 The history disclosed that three days previously, after running to catch a bus, she developed chest pain that radiated down the left arm. She continued on her shopping trip but felt rather weak. Two days later, while walking to church, she felt pain down the left arm. That evening she had indigestion. She attempted to walk about her home "to break up gas," but became so weak she had to call medical aid. Morphine by hypodermic and nitrogly cerin under the tongue gave her some relief. Physical examination three days later showed the heart sounds regular but weak and distant. No murmurs nor enlargement were present.

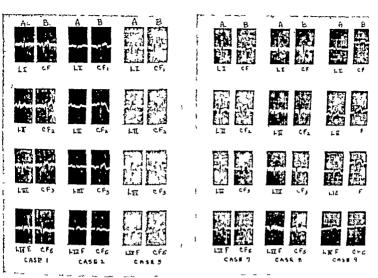

Fig 1

Figs 1, 2 and 3. The electrocardiograms reproduced in Figs 1, 2, and 3 show in Column A the commonly taken leads I II, III and IV F Those reproduced in Column B show CF 1 CF 2 CF 3 and CF 5 of the same case Examination of Column A shows suggestive myocardial changes but the diagnosis of anterosciptal infarction is made readily in each instance by the findings in Column B These findings are (1) absence of the R wave (2) frequently elevated RST segments (3) inversion of the T waves in CF 2 and CF 3 and (4) to some degree there usually are abnormal findings in CF 1 and CF 4 (L IV F) as well

Fro 3

lungs otherwise no signs of congestive failure The blood pressure was 120/74 (Fig. 2)

Case 7—J L. aged 64 a clarical employee was seen on April 29 1940 His history showed that on the way to work five weeks previously he had a peculiar feeling in his stomach and some discomfort in both arms. Two days later while he was dressing in the morning his arms began to ache and he experienced severo pain in the solar plevus area. He became weak exhausted and sweated profusely Physical examination with particular reference to the heart was negative. There was no congestive failure and the blood pressure was 164/84 (Fig. 3)

Case 8—J P aged 61 a molder by trade was seen on June 7 1943. His complaints were that after walking one quarter mile at his camp he experienced a band like constriction in his chest. He rested and on resuming his walk became weak mauseated, and perspired profusely. There was no sensation of pain Physical examination with particular reference to the heart showed distant apical sounds but no congestive failure. The blood pressure was 130/74 (Fig. 3)

Case 9 -A D, aged 54, a village grocer, was seen on January 23, 1947 The main facts in the history were that he had had considerable indigestion over a three-year period, usually relieved promptly by a dosage of baking soda For six months preceding his acute attack, he had noted chest pain of brief duration on exertion This always reacted favorably to rest At about 2 00 AM on the day he was seen, he awakened with severe chest pain and rapidly went into shock He was admitted to the hospital and on examination fourteen hours later was much improved His color was good There was no dyspnea and the heart sounds were of fair quality, no congestive failure was present. The blood pressure was 112/84 (Fig 3)

Case 10 -A S, aged 49, plant foreman, experienced chest discomfort late in the afternoon on March 7, 1947 He rested a short time and then left the plant and drove his car home. The pain persisted during the early evening, but he rested well all night and returned to work for four more days. The pain recurred on March 11 An electrocardiogram was taken at the plant, and he was advised that myocardial damage was present. He was seen at the office on March 21 There were no complaints at that time Physical examination, with particular reference to the heart, was negative The heart sounds were of good quality, with no murmurs detected nor evidence of enlargement The vital capacity was considerably reduced, and the blood pressure was 120/80 This case is presented so that serial electrocardiograms may be introduced to show that, as in other types of myocardial infarction, a considerable period of time may elapse before typical changes of anteroseptal infarction appear in the tracing (Fig 4)

Discussion

The purpose of presenting these cases of anteroseptal infarction has been to stress the importance of taking routinely the precordial leads CF 1 through CF 4 in all instances of suspected coronary disease By similar reasoning, an equally good case could be made for anterolateral infarction to stress the necessity of continuing these precordial leads through at least CF 5 and CF 6 The work of Wood et al * indicates, however, that a definite clue to this latter condition may be found frequently from charactenstic changes appearing in the three standard leads and lead IV F To date, however, I am unaware of any similar assistance from these leads in the diagnosis of anteroseptal infarction However, some of the tracings studied and considered typical of anteroseptal infarction show the T wave in lead 1 less prominent than T3 Dressler has noted this finding in a series of 45 cases reviewed by him in 1943 10 He felt, except in specific exceptions, that this sign was often diagnostic of antenor infarction and most valuable when the commonly accepted criteria for this condition was absent in the usual 4 lead electro-

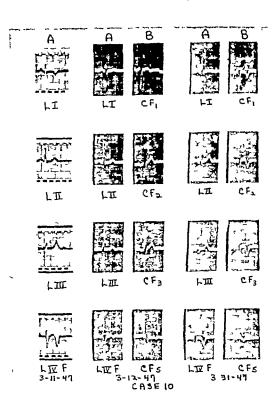

Fig. 4 The tracing on March 11, 1947 shows small Q1 with inverted T1, high T3, small Q4 with normal R4, and deep, coved inverted T4. The tracing on March 12, 1947, with precordial leads (Column B), shows T1 now upright, T3 less voltage, R4 higher, and slight late inversion of T4. CF 1, CF 2, and CF 3 are not remarkable, and CF 5 shows T wave inversion. The tracing on March 31, 1941, shows little change in lead 1, R2 is less tall, QRS 3 is smaller with bifid R waves, and T2 and T3 shows increased voltage. Lead IV F shows normal R with deep inverted T4. Leads CF 1, CF 2, and CF 3 show absent R waves and deep coved inverted T waves The T wave is inverted in CF 5. These serial tracings show that diagnostic signs of anteroseptal infarction may be delayed in their appearance.

cardiogram As reports accumulate, it is possible that finding T1 of less voltage than T3, and with lead IV F nondiagnostic, may prove helpful in suggesting the possibility of anteroseptal infarction

In this series of cases, fever and the more common laboratory procedures, sedimentation rate and white blood count, were characteristic of infarction in general ¹¹ In a total of 27 reviewed cases, only one feminine patient was found to have definite diagnostic signs of this condition. No patient has died up to the date of this report and this fact remains true despite the advanced cardiac failure as shown in several instances. All of these patients have responded well to accepted treatment of acute congestive failure. Blumgart and his associates have shown that the role

of the particular vessel occluded, and its relation to the general blood supply of the heart, is of great importance 12 It may be possible that these cases fall into the favorable 40 per cent group with nght coronary artery predominance There have been no irreversible complications and, once the diagnosis of anterosoptal infarction has been established the prognosus is good. This finding has considerable clinic importance since it is well known that patients with either anterior or posterior infarction are subject to sudden, un explained death even when they are considered to be well on the road to recovery

From the above data it would appear both reasonable and wise to accept the procedure of routinely taking precordial leads CF 1 through CF 4 and presumably helpful to continue through at least CF 6 in all cases of possible acute my ocar dial infarction The wisdom of following this same procedure in cases giving a history of chronic myocardial infarction appears substantiated equally well by the observations cited above

Conclusions

- The value of routine precordial leads CF 1 through CF 4 is established
- Evidence to show that anteroseptal infarction may pass unrecognized without these leads has been presented

- In this limited series of cases only one female patient has been found with anteroseptal in farction
- The prognosis in this type of infarction appears excellent
- It is strongly recommended that a full set of precordial leads rather than variations of CF 1 through CF 0 be taken in all cases of suspected mvocardial infarction

It is a pleasure to acknowledge the courtesy shown by Dr Frank N Wilson University Hospital Ann Arbor Michigan in reviewing both the manuscript and the electrocardiograms reproduced in this article.

RESEARCH FELLOWSHIPS IN MEDICINE AWARDED

Announcement is made of the Research Fellow ships in Medicine which have been awarded by the American College of Physicians for the year be-siming July 1048 The College makes available each year a limited number of these fellowships with stupends ranging from \$2,200 to \$3,200 the purpose of which is to give to young physicians, who are preparing for an academic career in internal medicine or pediatrics an opportunity to have a year of investigative experience as an early part of their preparation

The Board of Regents of the College, on the nomination of the Committee on Fellowships and Awards awarded six Research Fellowships in Medicine at their meetings in Philadelphia on November 22 and 23 1947

He is at present resident in medicine in the Duke University Hospital With the aid of the fellowship Dr Martin will undertake studies of bacterial metabolism in the Rockefeller Institute for Medical Research, New York City under the direction of Dr René J Dubos

The awards included—for research in New York

City-Dr Samuel P Martin Durham North Caro-

Dr Martin's premedical and medical courses were taken at Washington University St Louis where he received the MD degree in 1941. He

interned in the Barnes Hospital St Louis 1942-

1948 and served there also as assistant resident in medicine 1943-1944 Dr Martin served in the

U.S Army from 1944 until 1947

A PRELIMINARY REPORT ON A NEW AND SIMPLIFIED PENICILLIN VEHICLE

M J GOODFRIEND, M D , F A C S , I C Fischer, M D , and L J Caruso, M D , New York City

(From the Obstetrical and Gynecological Service of the Morrissania City Hospital)

SINCE the advent of penicilin many methods have been devised for the prolongation and maintenance of therapeutic blood levels without the necessity of injections at three-hour intervals. These have been limited to two forms (1) retarding the rate of absorption, and (2) diminishing the rate of excretion from the body.

The present report of a technic used in parenteral administration of penicillin at the Morrissania City Hospital is a preliminary one. In the study submitted it was not our intention to determine the antibiotic activity of penicillin, but rather to determine whether we could obtain therapeutic blood levels and maintain them for varying periods of time without increasing or producing side-effects. For the purpose of this study we used a new and simplified solvent, commercially called Solvecillin*, a prepared emulsion of cholesterol esters containing one per cent by weight of beeswax, as a vehicle for the use of crystalline penicillin

Seventy patients were chosen without any known renal pathology. Twenty of these were given 100,000 units in 2 cc of prepared emulsion, 35 patients were given 200,000 units in 2 cc of prepared emulsion, and 15 patients were given 500,000 units, of these, eight received the dose in 3 cc of prepared emulsion, and for the remaining seven, 4 cc of the solvent were used

Technic

The designated amount of prepared emulsion was injected into a vial of penicillin, which was agitated slightly, and the contents withdrawn into a syringe with a No 20-gage needle. The emulsion was then injected intramuscularly into the gluteal muscle in the usual manner. Blood was taken at intervals from four to twenty-four hours after injection. The blood samples were assayed according to the method prescribed by the Federal Food and Drug Administration. The findings are submitted herewith

The 20 patients using 100,000 units of penicillin with 2 cc of the vehicle were found to have a blood level of 0 19 units at the end of four hours, 0 15 units at the end of six hours, 0 10 units at the end of eight hours, 0 08 units at the end of ten hours, and 0 06 at the end of twelve hours (Fig 1) The 35 patients using 200,000 units of penicillin with 2 cc of the vehicle were found to have blood levels of 0 39 units at the end of four hours,

0 12 at the end of eight hours, 0 1 at the end of ten hours, 0 09 at the end of twelve and sixteen hours, 0 06 at the end of eighteen hours, 0 04 at the end of twenty hours, and 0 025 at the end of twenty-four hours

With 500,000 units of penicillin, the average blood levels at the end of twenty-two and twenty-four hours were 0.09 units

Comment

With the use of the prepared emulsion we have been able to demonstrate that, in order to maintain constant and therapeutic blood levels for prolonged periods, only one injection a day was required instead of divided doses of eight injec-

Allergic reactions were negligible A mild urticarial rash was observed in only one subject of the seventy injected, and this was overcome with the use of benadryl

No abscesses or foreign body reactions were observed in any of the 70 patients

Summary

1 This prepared emulsion as a vehicle offers a satisfactory method for prolonging the action of and retarding the excretion of penicillin

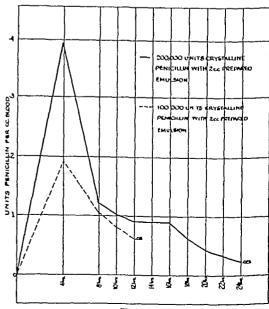

Fig 1

- With 100,000 units of penicillin used, a blood level of 0 06 units was maintained at the end of twelve hours. With 200,000 units of penicillin, a concentration of 0 025 units was maintained at the end of twenty-four hours which is sufficient for the majority of cases requiring the drug
- 3 In those conditions where a greater concentration of penicillin in the blood is required, 500,000 units of penicillin in the emulsion meets the necessary requirements, since at the end of

twenty four hours α blood level of 0.09 units is still present

- 4 Since therapeutic levels are obtained with rapidity and maintained with one injection per day, a considerable reduction in nursing effort is obtained
- 5 A simple and economical method of prolonging the action of penicillin is presented

New and simplified Bolvecillin was courteously supplied by Polvecillin, Inc. Newark, New Jersey

CANCER MOBILE

The farmer's wife with the lump in her breast, the village store clerk whose voice has dwindled to a beans whisper—no longer need they go without examination for months and live in the fear that

they may have cancer

A new weapon, forged by the Kentucky division
of the American Cancer Society with the aid of the
Oeneral Electric X Ray Corporation has made it
possible for people in outlying areas, where doctors
and x-ray facilities are few to receive first-class
medical examination for cancer without the cost
and difficulty.

and difficulty of traveling great distances.

This weapon is the first mobile cancer detection bus ever to be equipped with x ray apparatus.

Modeled after buses now used for x ray surveys of apparently healthy persons in tuberculosis campaigns, the cancer bus, known officially as the Cancer Mobile, will carry x-ray into the byways of Kentucky acting as an extension arm of the states widespread network of 16 cancer clinics.

Primary purpose of the unit will be to provide free examination for suspected cases among those unable to pay. But, in addition, doctors who do not have ray facilities may also use the apparatus in the bus for their private patients

To insure the fullest utilization of the bus and offer diagnostic facilities, the cancer organization has under way an intensive program of education. This is designed to increase the public s awareness

of warning symptoms and to stress the importance of routine periodic medical examinations.

The versatile x ray unit with which the bus is outfitted features one x ray tube that is capable of two types of examinations—radiography (the making of x ray films) and fluorescopy (the study of the body organs in motion by the physician). A special device is provided to hold films so that chest x rays can be taken in an upright position.

Also incorporated into the bus is a darkroom for developing x-ray film, a dressing booth, and a special laboratory table for examining blopsy specimens (sections of living discus which can be studied under the microscope to dottermine malignancy)

The bus will go only to counties which extend a formal invitation through their county medical societies. After arrangements have been made to have the unit go to a particular county members of the medical society and other groups will be asked to volunteer assistance at the diagnostic clinic

At the same time, while the unit is in the county educational programs will be presented to lay groups on cancer control. Movies will be shown and ratio stations will be asked to carry live-speaker programs.

Arrangements will be made with the cooperating medical society to have a meeting of its members during the time the cancer clinic is held. At this time a scientific program will be presented by clinic staff members on cancer diagnosis and treatment

FIXED EXTENSION OF THE KNEE DUE TO CAPSULAR CONTRACTION

LEWIS CLARK WAGNER, MD, New York City

(From the Hospital for Ruptured and Crippled)

THE contraction of the supporting ligaments and the capsule of any joint in the body may become evident after trauma, infectious processes, or prolonged immobilization ending in limitation of motion and function of the articulation or articulations of the part involved. The knee is apparently the one articulation in which loss of motion gives the greatest disability, because of the special function desired of it in locomotion and the necessity for its being out of the way in the sitting position.

Bennett has described a technic of quadriceps tendon lengthening in primary shortening of the quadriceps femoris muscle which has yielded good results ¹

Thompson has described an operation for scarring of the vasti muscles with freeing of the affected muscles and removal of part of the vastus intermedius without section of the rectus femoris tendon, which has yielded good results in many cases ²

The treatment of such cases which are presented in this paper is section of the contracted capsule of the joint (assuming there are no bone changes in the articulation of the knee apparent in the x-ray examination) associated with elongation of the quadriceps tendon

These case histories concern individuals in whom the primary cause of fixation of the knee was capsular contraction. The shortening of the quadriceps apparatus was a secondary factor.

Operative Technic

A tourniquet is applied to the thigh and the knee is prepared and draped in the usual manner, as the surgeon desires A long, median parapatellar incision is made about 9 inches long, extending from the tibial condyle upward, exposing the capsular ligaments and the quadriceps The skin is reflected both medially and laterally, exposing the anterior capsular struc-The quadriceps tendon is tures of the knee joint divided in an inverted V-shaped incision, about 4 inches above the patella, separating the tendon from the medial and lateral vasti muscles incision is then carried lateral and medial to the patella through the capsular ligaments, fanning laterally to the superior margin of the semilunar cartilages in the region of the lateral and medial

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Orthopedic Surgery, May 9 1047

ligaments of the knee The flap, consisting of the sectioned quadriceps tendon, the patella, and the incised capsular ligaments, is reflected downward and the knee flexed over the table to an angle of 90 degrees The flap is replaced, and the capsular ligaments and the quadriceps tendon are sutured in the new position, with the knee flexed to 90 degrees, which allows for about 2 to 3 inches of lengthening of the quadriceps tendon If the capsular ligaments cannot be closed, duplications of the capsule can be separated to draw over the unclosed capsular separation is closed in the usual manner and plaster of paris dressing is applied from the groin up to and including the toes, with the knee flexed to 90 degrees

Postoperative Treatment

Ten to twelve days after operation the wounds are dressed, and the sutures are removed this time there is considerable swelling about the knee, but the limb is nevertheless placed in a suspended splint with a movable knee attachment With the aid of pulleys and rope, the knee is passively pulled from an angle of 90 degrees to complete extension, as much as the patient can endure without discomfort These exercises are carried out for a period of two weeks when the patient is usually ready for ambulation with the aid of The patient is encouraged to walk with daily visits to the physiotherapy department for pool treatment, if available, and muscle reeducation by passive exercises to retain the range of motion secured at operation Progress is slow, but the patient soon regains his confidence, and, as strength is recovered in the quadriceps muscle, support can be discarded Low heel shoes are necessary to give stability to the limb final effect of after-treatment can be expected in one to two years

Case Reports

Case 1—Charles S, aged forty-seven, was admitted to the Hospital for Ruptured and Crippled, June 27, 1927 The patient had a malunion of the femur at the junction of the upper and middle thirds with 4 inches overriding. Open reduction was performed. The site of the malunion was broken up, the fragments freed, the wound closed, and a Steinmann pin was placed through the condyle region. Traction was applied, followed by application of plaster two months later which remained on until September 23, 1927

The patient was readmitted to the hospital on January 4, 1929 The fracture site had united with no deformity The knee was fixed in extension with only a few degrees of motion in the knee joint X-ray showed no narrowing of the joint space of the knee. On January 5 1929 elongation of the quadriceps tendon was brought about by the Bennett procedure Only about 40 degrees of motion could be secured On February 1 1929 under other anesthesia the knee was manipulated and flexed to a right angle. The wound was completely broken open, and it was noted that the capsule had broken obliquely. The wounds were drawn together and plaster applied with the leg at a right angle. Four weeks later the plaster was removed and a splint applied with a joint at the knee for exercising. On March 19 1929 the patient was walking about. The knee could be fleved to a right angle and extended to about 145 degrees The patient continued active physiotherapy and stretching and on April 29 1020 walked with freedom using a cane on the right aide. The knee could be flexed to 90 degrees and extension was possible to 165 degrees with forcible extension to 180 degrees

Examination three years later showed the patient walking without a limp He had active extension to 170 degrees and flexion to 90 degrees and was very well satisfied with the result

Case 2—Shirloy L. aged twenty four, was admitted to the Hospital for Ruptured and Crippled on January 3 1020. The patient had previously had a general arthritis with resultant loss of motion in the left knee but no pain Examination at the time showed extension to 180 degrees and a range of flaxion of about 15 degrees.

On January 4 1929 under general anesthesia an attempt was made to move the knee by forcible manipulation, but this was impossible. The patient was discharged from the hospital and returned on May 19 1929 At that time using a tourniquet the quadriceps tendon was explored and divided according to the Bennett procedure No motion could be secured in the knee Lateral incusions were then extended close to the patella across the capsule of the knee joint fanning laterally to the attachment of the lateral ligaments. The knee could then be forcibly flexed to a right angle The capsule of the joint was sutured and the patellar tendon was resutured allowing about 3 inches lengthening The skin was closed in the usual manner and plaster applied from the groin to the ankle with the knee flexed at 90 degrees. Three weeks later, when the wounds had healed the patient was placed in suspension and traction and both active and passive motion was started. At the end of the fifth week, she was walking with the aid of crutches and receiving active physiotherapy The patient when discharged from the hospital on July 15 1929 had passive extension to 180 degrees, setive extension to 140 degrees, and flexion to a right angle. The patient was carried along for another six months on active physiotherapy which consisted of massage to the quadriceps area and active motion to the knee

Seventeen years later the patient walked without a limp. She had extension to 175 degrees actively and to 180 degrees passively, with flexion through an arc of about 95 degrees. There was no pain no weakness and no limp.

Case 3 -Geoffrey B aged forty three was ad mitted to the Hospital for Ruptured and Crippled, January 8, 1936 The patient gave a history of hav ing been perfectly well until November 1934 when he began to have pain, swelling and stiffness in both knees. A diagnosis of hypertrophic synovitis was made 1 rays showed no bone changes about either knee joint. A synovectomy of the right knee was performed on June 9 1938 and on the left knee on June 25 1936 The course following the operation was uneventful, but the patient had little or no motion in either knee. He was carried on active physictherapy but no motion could be secured and the patient was very much disabled On October 13 1936 both knees were manipulated under anesthesia only a few degrees of motion were secured. The patient was so incapacitated because of the stiff knees that something had to be done to make walk ing less difficult for him, although he had no pain. Since the right knee had about 15 or 20 degrees of motion and the left knee had none the latter was relected for operation

On January 23, 1937 the knee was explored, and the quadriceps tendon elongated according to the Bennett technic, but it was impossible to flex the knee Parallel incisions of the patella were made and the natella elevated. Still no motion could be secured because of the capsular contraction When the capsule was divided obliquely the knee could be flexed to a right angle The wounds were closed, lengthening the quadriceps tendon about 2 inches and approximating the capsule as well as possible A plaster of paris dressing was applied with the knee at a right angle and was removed at the end of three weeks. The wound healed the patient put in a splint and active manipulation of the knee was started The splint was removed at the end of three weeks the patient being carried on at the physictherapy department for the next eight months.

Examination on June 29 1039 showed the left knee to have active extension to 168 degrees and flexion to 70 degrees. The knee could be extended passively to 180 degrees. There was no swelling and the patient had no complaints. The right knee which was not operated upon, had only a few degrees of motion. There was no pain and the patient was satisfied with the result.

Case 4.—Frances E. aged thirty four was ad mitted to the Hospittal for Ruptured and Crippled June 16 1937 For the past two years the patient lad marked swelling of the right knee. She had had a thorough study and tuberculosis was ruled out It was considered a case of hypertroplue synovitis. At that time the patient had a range of motion from 180 degrees extension through an arc of 90 degrees flexion. A synovectomy of the right knee was per formed and the patiella was removed because of changes in the cartillaginous surface. Following the operation the wound healed satisfactorily and the patient was walking on the tenth day. She was sent

ular, the deformity is usually a flexion rather than an extension contracture—If there is coexisting intra-articular pathology of severe degree, little, if any, improvement will be obtained by this procedure alone

As Dr Wagner points out, and I want to stress it, this procedure is applicable to cases without appreciable intra-articular pathology, as are the Bennett quadriceps lengthening operation and the Thomp-

son quadricepsplasty

I believe Dr Wagner's procedure augments the Bennett procedure in that it releases the constricting components of the fibrous capsule itself, as well as moderately lengthening the shortened quadriceps Dr Thompson's procedure presupposes no permanent secondary shortening of the quadriceps mechanism and is applicable to recently developed

dense adhesions between the components of the quadriceps mechanism, particularly the vastus intermedius and the femur. In other words, careful evaluation of the primary pathology is necessary before choice of procedure is made. The choice may be impossible before the capsule and quadriceps mechanism are exposed surgically.

One cannot emphasize too strongly the diligent follow-up care stressed by Dr Wagner, whose cases, with such care, show that they "improve with age" The patient's mental attitude is of equal importance

ARMY SURGEON GENERAL ANNOUNCES IMPROVEMENTS IN ADVANCED TRAINING

Major General Raymond W Bliss, Surgeon General of the Army, recently announced adoption of a number of changes in the Army Medical Department graduate professional education program for the coming year based on a thorough study of mine months' operation of the program and surveys made by nine teams of civilian medical experts

The innovations, effective immediately, are designed to maintain the quality of patient care and to elevate the caliber of training at Army general hospitals. As announced by General Bliss, the

major changes are as follows

Graduate training in psychiatry is being strengthened and concentrated in three general hospitals— Letterman (San Francisco), Fitzsimons (Denver), and Wal er Reed (Washington, D.C.) This plan will afford each resident more individual instruction

Many qualified civilian consultants will be added to the attending staffs of the hospitals which are engaged in teaching. These will be distributed among the various special fields of medicine and surgery in which the Army is training residents

and interns

The administrative responsibilities of qualified teachers will be lessened by the transfer of routine paper work to administrative assistants assigned from the Medical Service Corps This will allow the professional instructors to devote the major portion of their time to teaching and to the care of patients

Qualified instructor personnel will be kept on duty in their present assignments for as long as possible. When it becomes necessary to move them, they will be placed in such locations as to enable them to teach so that maximum utilization can be made of their experience and ability

Special instruction in the best methods of medical education is being provided for key military instructor personnel by means of short courses at selected civilian medical teaching institutions

The number of conferences at which attendance by all residents and interns is required is being reduced. Where possible, these will be held at such times as will not interfere with bedside teaching Likewise, the administrative duties of student officers are being reduced to the bare minimum consistent with excellent care of patients under their supervision.

More adequate means of resident-intern selection, and evaluation of progress, are being placed in operation. Personal interviews will receive special emphasis. Individual evaluations will be made of student officers by the civilian instructors as well as by the regularly assigned chiefs of services and sections at the teaching hospitals.

The actual content of the program of instruction for each special field will be developed in more de-

tail

Portions of the program will be delegated to the military or civilian instructor who is best qualified in each particular phase, so that accurate and complete coverage will be obtained within the residency span

Finally, the present obstacles in the organization of interns and residents into the accepted pyramidal system are being overcome, so that the student officers may be given increased responsibility in care of patients, teaching, and the supervision of others, as they progress from one year of training to the next

TEAR OF THE LATERAL LIGAMENT OF THE ANKLE

LOUIS A GOLDSTEIN M.D., Rochester New York

(From the Department of Surgery Duranon of Orthopedies University of Rochester School of Medicine and Dentistry)

A NEGATIVE routing roentgenographic examination of a sprained ankle does not rule out a serious injury. In the more severe sprains of the ankle, a complete rupture of the lateral ligaments must be suspected. On clinical exsmination, one can suspect a ligament tear the diagnosis can be definitely established by roentgenograms taken with inversion stress applied to the foot The evaluation of the degree and severity of lateral ligament tear offers no problem if one takes advantage of the informa tion gained by roentgenographic study under inversion stress. On the other hand the treatment indicated is not always so clearly defined What is the treatment of choice? Is plaster cast unmobilization necessary for optimum healing and stability? If so, how long need immobili ration be continued? Is firm adhesive strapping adequate? Is novocaine injection and early weight bearing good treatment?

The lateral ligament of the ankle joint consists

of three fasciculi

1 The anterior fasciculus or anterior talofibular ligament

2. The lateral fasciculus or calcaneofibular ligament

The posterior fasciculus or posterior talofibular ligament.

The lateral ligament components stabilize the talus in the mortise preventing tilt of the talus when inversion stress is applied to the foot Rupture of one or more of the fasciculi of this ligament allows the talus to tilt. The degree of tilting or subluxation depends upon the degree of tear of the lateral ligament structures.

Observations on postmortem specimens in which the lateral ligament components were revered singly and in various combinations are reported elsewhere. It was found that cutting one or two fasciculi resulted in less than a 15 decree tilt of the talus. When all three components of the lateral ligament and the adjacent iont capsule were severed a 30 degree or greater tilt resulted.

The diagnosis of tear of the lateral collateral brament of the ankle joint cannot be made with cartaints on the basis of clinical signs. In our experience however, the clinical examination

Prevailed at the 141st Annual Meeting of the Medical County of the State of New York Buffalo Section on Orthobedier Surgery May 8, 1947 serves as a reliable guide in choosing those cases warranting examination under inversion stress

In sovere sprains lateral ligament rupture should be suspected The history of something "snapping" 'giving way," or "slipping out of place" is significant. In the absence of a fracture on routine roentgenograms these subjective symptoms are highly suggestive of ligament rup-When the injured andle is seen within an hour or two after injury, there may be little objective evidence of severe injury. During this early period tenderness and swelling on the medial aspect of the ankle over the deltoid high ment is an important sign. With complete rupture of the lateral ligament there is a temporary dislocation of the tilus and resultant injury to the deltoid ligament while no deltoid ligament trauma and no swelling or tenderness on the medial side of the ankle joint are evident in sim During the first few hours, a fairly well circumscribed awelling forming a semicircle around the tip of the fibula with tenderness at the points of origin of the lateral ligament, may be present. In other cases, there is an egg shaped, localized swelling largely below the tip of the fibula becoming diffuse and marked subsequently Ecohymosis is usually present and tenderness is maximum in the region of the Interal ligament components Tenderness of the distal tibiolibular joint, indicating some damage to these ligaments is a constant finding

In one group of cases examined over a four month period, data were kept on the number of positive and negative results of inversion stress examinations. Forty-one ankles were subjected to inversion stress under anesthesia for roentgenographic examination. Twenty nine of these examinations showed 30 or more degrees of talar tilt indicating complete tear of the lateral ligament of the ankle, seven showed less than a 30-degree talar tilt indicating meomplete tear of the lateral ligament, five showed no abnormal talar mobility. Thus 36 out of 41 cases were positive.

Routine anteroposterior and lateral reentgeno grams are taken. Those cases in which the ankle joint shows no fracture or mortise spread and in which the clinical examination reveals lateral ligament tenderness of definite or questionable significance, are examined reentgenographically ular, the deformity is usually a flexion rather than an extension contracture. If there is coexisting intra-articular pathology of severe degree, little, if any, improvement will be obtained by this procedure alone

As Dr Wagner points out, and I want to stress it, this procedure is applicable to cases without appreciable intra-articular pathology, as are the Bennett quadriceps lengthening operation and the Thompson quadricepsplasty

I believe Dr Wagner's procedure augments the Bennett procedure in that it releases the constricting components of the fibrous capsule itself, as well as moderately lengthening the shortened quadriceps Dr Thompson's procedure presupposes no permanent secondary shortening of the quadriceps mechanism and is applicable to recently developed

dense adhesions between the components of the quadriceps mechanism, particularly the vastus intermedius and the femur. In other words, careful evaluation of the primary pathology is necessary before choice of procedure is made. The choice may be impossible before the capsule and quadriceps mechanism are exposed surgically.

In the absence of a fracture on routine roent enograms these subjective symptoms are highly suggestive of ligament rup-When the injured ankle is seen within an hour or two after injury, there may be little obsective evidence of severe insury. During this early period tenderness and swelling on the medial aspect of the ankle over the deltoid ligament is an important sign With complete rupture of the lateral beament there is a temporary dislocation of the talus and resultant injury to the deltoid ligament while no deltoid ligament trauma and no swelling or tenderness on the medial side of the ankle joint are evident in simple sprains During the first few hours, a fairly well circumscribed swelling forming a semicircle around the tip of the fibula with tenderness at the points of origin of the lateral ligament, may be present. In other cases, there is an egg shaped localized swelling largely below the tip of the fibula, becoming diffuse and marked subsequently Ecclymosis is usually present and tenderness is maximum in the region of the Interal ligament components Tenderness of the distal tibiolibular joint, indicating some damage to these ligaments, is a constant finding

In ne group of eases examined over a four month period data were kept on the number of positive and negative results of inversion stress examinations. Forty-one ankles were subjected to inversion stress under anesthesia for coentgenographic examination. Twenty nine of these examinations showed 30 or more degrees of talar tilt indicating complete tear of the lateral ligament of the ankle, soven showed less than a 30-degree talar tilt indicating incomplete tear of the lateral ligament, five showed no abnormal talar mobility. Thus 36 out of 41 cases were positive.

Routine anteropostonor and lateral roontgeno grams are taken Those cases in which the ankle joint shows no fracture or mortise spread and in which the clinical examination reveals lateral ligament tenderness of definite or questionable spriftcance, are examined roontgenographically

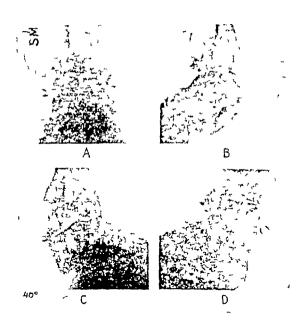

Fig 1 Case of complete tear of the lateral ligament of the ankle in a forty-eight-year-old volunteer Red Cross worker — Inversion injury sustained when she stepped off a loading platform — A, B, Routine anteroposterior and lateral views of the ankle showing no fracture of mortise abnormality C, Under general anesthesia (sodium pentothal) inversion stress examination shows a 40-degree tilt of the talus — D, Inversion stress examination of the uninjured ankle shows no tilt of the talus

under inversion stress The uninjured ankle is examined under stress for comparison to note the normal range of talar mobility

The patient is anesthetized with sodium pentothal on the x-ray table with the lower extremities exposed to the midthigh The foot is forcibly inverted by grasping the forefoot with one hand and applying counter pressure against the distal third of the leg with the other hand With the foot in maximum inversion and the knee in a true anteroposterior plane a roentgenogram of the ankle is taken The same maneuver is repeated on the uninjured side and the negatives developed immediately Subluxation of the talus is frequently palpable and visible during the inversion maneuver in cases of complete lateral ligament tear, noted only with 30 or more degrees of talar tilts A complete rupture of the three components of the lateral ligament allowing the talus to sublux slightly posteriorly as well as tilt into varus is also indicated by this Undue force need not be applied, but the inversion maneuver improperly performed will not give a true picture of the degree of injury (Fig 1)

The cases that showed a greater than 15 degree tilt of the talus on roentgenographic examination under inversion stress were immediately immobilized in a circular, below-the-knee

plaster of paris cast with the foot at 90 degrees dorsifiexion in neutral version. Normal ankles usually show less than a 5 degree tilt of the talus under inversion stress, although occasionally as much as 10 degrees is observed.

In recent ankle injuries, because of pain and sensitivity, the extent of injury to the lateral ligament is evaluated best under anesthesia Although general anesthesia is ideal for inversion stress examination, the injury can be satisfactorily evaluated under local anesthesia. About 25 cc of novocaine are injected into the hematoma or region of the lateral ligaments, the examination being made after a lapse of twenty minutes. Because of peroneal muscle spasm the tilt of the talus can be expected to be ten to twenty degrees less than when the test is done under general anesthesia (Fig. 2)

Fig 2

Discussion

The diagnosis of tear of the lateral collateral ligament of the ankle joint can be suspected in certain "ankle sprains" Since routine anteroposterior and lateral roentgenograms are negative, the diagnosis can be established only by roentgenographic examination of the ankle under inversion stress

Correct diagnosis and adequate treatment at the time of injury will prevent the symptoms of an unstable ankle The usual mobilizing regime for the treatment of a simple ankle sprain is not good treatment for ruptures of the lateral ligament of the ankle Particularly contraindicated is the treatment of severe "ankle sprains," frequently having tears of one or more fasciculi of the lateral collateral ligament of the ankle, by local novocaine injection and early unprotected weight bearing Relief of pain, resulting from the novocaine injection, makes possible and encourages a degree of activity which is detrimental to the healing of the torn ligaments Immobilization, prolonged and continuous, rather than mobilization, is required for healing of the ligaments and a stable ankle

A total of 55 cases (51 cases in soldiers, 4 cases in civilians) of complete tears of the lateral collateral ligament of the ankle joint were diagnosed by roentgenographic examination of the ankle with inversion stress under anesthesia

In a group of 101 acute ankle sprains seen in an Army general hospital during a four-month period, 29 cases showed complete tears of the lateral ligaments of the ankle. Forty-one of this group of 101 were subjected to roentgenographic examinations under inversion stress. The other 60 ankles were relatively mild sprains and were not suspected of ligament rupture. In this group of soldiers 28 per cent were found to have complete rupture of the lateral ligament.

There is some difference of opinion in regard to the duration of immobilization required for complete healing of the torn ligaments rlod from ax to ten or twelve weeks has been recommonded Watson-Jones states that a mini mum of ten weeks' immobilization is required on the basis that "union is not sound unless im mobilization has continued for at least ten Even after that time slight tilting may persist, but only within the limits capable of control by muscle power" In a report on "Rehabilitation in the ETO ' the following statement is made regarding 25 cases of rupture of the lateral ligaments of the ankle "Immobilization in plaster for six to eight weeks is the method of choice All were returned to full duty diagnosed cases resulted in serious incapacity ' We have recommended an eight-week period of immobilization for the patients in whom we initiated treatment The author has continued this practice in civilian patients In a young, vigor ous man or woman who is interested in a strong and stable ankle the most desirable treatment, in the author's opinion, is plaster cast immobili ration for an eight-week period In the patient over forty years of age who is not engaged in competitive athletics or other vigorous types of activity requiring perfect ankle stability, ankle strapping may be adequate treatment. The strapping should be continued for a six to-eightweek period

Follow-up inversion stress examinations have been obtained in 5 cases In 4 instances there was no residual tilt of the talus on roentgenographic examination under inversion stress These cases showed 20-, 22- 30-, and 40-degree tilt of the talus on the initial examination fifth case showed a residual 15-degree talar tilt four months after the injury, having been a 45degree tilt originally The uninjured ankle in this case also showed a 15-degree tilt of the talus on inversion stress examination. The follow-up examinations were performed without anesthesia from three to nine months after injury thesia is not required for evaluation of residual bgament laxity because there is no longer any acute sensitivity of the lateral ankle structures

What happens to the lateral ligament ruptures that are not recognized and are treated as simple ankle sprains? Failure to immobilize lateral ligament ruptures results in failure of the ligament to heal or in healing in a relaxed position

The clinical significance of this abnormal talar mobility depends upon the ability of the individual to compensate for the loss of the stabilizing ligaments by peroneal muscle function. Incomplete ligament tears with talar tilts of less than 15 degrees are usually compensated for by peroneal muscle function, and therefore do not give rise to symptoms of a weak ankle.

Ankles that show a greater than 30-degree talar tilt give rise to symptoms of recurrent discostion of the ankle. This is the chronically weak ankle that gives way at the least provocation and is frequently a rather disabling condition. When this type of ankle gives rise to disabling symptoms, the only effective treatment

is operative stabilisation

The ankles that show persutent tilts between 15 and 20 degrees are not consistent in the significance of the tilt as related to chronic symptoms. Some of these tilts give rise to symptoms, others do not. It would appear that the presence or absence of symptoms depends upon the ability of the individual to compensate for the lack of ligament stability by persueal muscle function. Some people can accomplish this others cannot

There is a need for more definite information on the end results of severe ankle sprains and lateral ligament tears, particularly in relation to the type of treatment, duration of immobilization presence or absence of chronic symptoms and residual talar mobility as determined by reentgenographic examination under inversion stress following recovery from the acute symptoms

Conclusions

- 1 The diagnosis of tear of the lateral collateral ligament of the ankle joint is made by examination of the ankle with inversion stress under anesthesia. This condition must be considered in moderate and severe soft tissue ankle injuries.
- 2 The normal ankle under inversion stress will show less than a 10-degree talar tilt. Com plete tear of the lateral ligament and the lateral joint capsule will show a 30-degree or greater talar tilt.
- 3 Complete tear of the lateral ligament of the ankle probably requires prolonged immobilization in a plaster cast to insure complete healing
- 4 Undagnosed and untreated ligament tears may result in unstable ankles
- 5 Further information on end results is required before determining the most favorable treatment for complete tears

FRIEDLANDER'S BACILLUS MENINGITIS, TREATED IN PART WITH STREPTOMYCIN, WITH RECOVERY

GERALD I FISHER, M.D., Brooklyn, New York

(From the Medical Service, Kings County Hospital)

FRIEDLANDER'S bacillus meningitis is uncommon In 1943 Ransmeier and Major¹ surveyed the literature and found reports of 29 cases, to which they added one of their own. Of these 30 cases, only three survived. The one reported by Rothschild² in 1931 was the only reported recovery prior to the use of sulfonamides. Included in the group of 30 cases cited by Ransmeier and Major,¹ two cases² were cured following sulfapyridine therapy. Their article also mentions two cases⁵ c in which recovery followed treatment with sulfadiazine, although these latter two are not included in the group of 30 reviewed cases.

Since this survey was published, the author has found three more reports of such cases. In 1943 Mori⁷ reported a case in a 26-month-old infant in which recovery followed the use of sulfonamide (soluseptazine) therapy. King,⁸ in 1946, reported a case in a 6-month-old infant treated unsuccessfully with sulfadiazine. Autopsy of this case revealed meningitis, ileocolitis, and bronchopneu-

monia caused by the Friedländer bacillus

Later in 1946, Tartakoff, Grynbaum, and Le-Compte⁹ reported a case in a 49-year-old man This patient had a craniotomy for removal of a meningioma and subsequently developed Fried-länder bacillus meningitis. At first sulfadiazine and penicillin were employed without response Streptomyein was then administered intravenously and intracisternally. These authors noted a marked decrease in the viscidity of the spinal fluid following administration of streptomyein. The patient died and came to autopsy, where it was found that the cause of death was pulmonary embolism. There was nearly complete absence of microscopic evidence of meningitis.

To date, therefore, this author has found reports of 35 cases of Friedländer's bacillus meningitis in the literature, with recovery in 6 cases. I wish to report another case, treated in part with strepto-

mycin, in which recovery ensued

Case Reports

C R., a 65-year-old white woman, was admitted to the Kings County Hospital on August 7, 1945, because of fever and disorientation of eighteen hours duration For a year and a half prior to admission the patient had been troubled with severe pain in her left ear, accompanied by severe dizziness, for which she had attended the clinic of another hos-For a month prior to admission the patient had frequent attacks of buzzing in her left ear, followed by left hemicranial headaches Three days before admission the patient remained in bed because the headache was so severe At this time The day before she also developed a sore throat admission the patient became disoriented, developed projectile vomiting, and had a temperature of 105 F Stiffness of the neck also was noted the evening prior to admission. The history was otherwise

noncontributory

On admission the temperature was 101 8 F, pulse 96, respirations 24, and blood pressure was 140/90 There were no gross abnormalities of the head The pupils were round, regular, and equal, but appeared fixed in mid-dilatation The extraocular movements seemed to be normal. Funduscopic examination was normal The left eardrum appeared reddened, and there was loss of landmarks The neck was markedly rigid The lungs were clear to percussion and auscultation The heart was not enlarged, the sounds were of good quality, with normal sinus rhythm, and no murmurs were heard Examination of the abdomen was negative, and the extremities were in no way remarkable Neurologic examination revealed extreme nuchal rigidity and positive Brudzinski and Kernig signs bilaterally The Babinski sign was not present The abdominal reflexes were absent The deep tendon reflexes were hypoactive in all extremities

A lumbar puncture was performed on admission The spinal fluid was cloudy. The initial pressure was 450 mm water and final pressure 180 mm. On smear, there were many gram-negative encapsulated bacilli seen. There was a large increase in polymorphonuclear leukocytes. The impression on admission was meningitis, the cause to be determined. The possibility of a left-sided cerebral abscess was also considered. At this initial lumbar puncture 50,000 units of penicillin were injected intrathecally, and the patient was put on penicillin, 20,000 units every three hours intramuscularly. Sodium sulfadiazine was administered by the intravenous route, 25 Gm every six hours. The initial blood count revealed 21,000 white blood cells, with 84 per cent poly morphonuclears. There was 13 5 Gm hemoglobin. The admission urinalysis showed a three plus albumin but was otherwise.

negative

The patient's general condition was unchanged twenty-four hours later—At this time a report was received on the spinal fluid taken on admission and revealed total protein of 262 mg per cent, sugar less than 10 mg per cent, the smear showed many gram-negative encapsulated bacilli, and culture revealed type A Friedländer bacilli. At this time the dosage of penicillin was increased to 50,000 units every three hours intramuscularly. Another lumbar puncture was done and 20,000 units of penicillin injected intrathecally. Report of a blood culture taken on admission revealed the presence of staphylococcus aureus, which was considered a contaminant. Three other blood cultures taken during the course of the illness were sterile.

Two days after admission the patient's condition remained unchanged, and a blood transfusion was given as supportive therapy along with the other intravenous fluids. At this time it was becoming apparent that therapy with penicillin and sulfadiazine was ineffective in this case, and consideration was given to the use of streptomy cin. The patient's temperature varied between 99 2 and 103 2 F, the higher temperatures being attained in

the afternoon and evening. Since admission the patient had been unable to void spontaneously, which necessitated frequent catheterization nally a retention catheter was inserted. The thera peute regimen originally instituted with penicillin and sulfadiazine was continued while efforts were made to obtain a supply of streptomyein, which at that time was quite scarce and difficult to acquire The patient remained in a stuporous, comicomatose state, meaning frequently and at times becoming

quite restless. On the afternoon of August 10 1945 a supply of 10 000 000 units of streptomy cin hydrochloride was obtained from the Merck Company of Rahway New Jersey Because of the limited supply available, it was decided to give the patient 250,000 units every four hours intramuscularly although a much larger dose had been planned. Penicillin was discontinued, but sulfadiazine was maintained as before, 2.5 Gm every six hours. The first does of streptomy cin was administered at 4 1 M., August 10 1945 It had been noted on this day that the patient was beginning to show slight improvement in her general condition. She responded when her name was called and recognized members of her she began taking fluids and medication orally for the first time. All these signs of improvement were noted prior to the first dose of streptomycin.

The following morning a lumbar puncture was done and 250 000 units of streptomy cin in 10 cc of raline were instilled intrathecally. Within a few minutes the blood pressure fell to 100/40. No other signs or symptoms were observed. Threeeighths of a grain of ephedrine sulfate was given and the blood pressure soon rose to 140/80 noon the temperature had come down to 99.8 F The patient continued to maintain the improve-

ment first noted the previous day

The report on the spinal fluid obtained at this time revealed cloudy fluid, great increase in poly morphonucleurs, a few grant-negative intracellular bacilli, Friedlander bacilli present on culture after eventy-two hours, total protein 145 mg per cent, sugar 17 mg, per cent, sulfadiazine level 10 mg, per

The initial pressure was 200 mm. water, final pressure 110 mm. water with normal dynamics Pandy reaction was four plus. At 4 r u. that day the patient's temperature went up to 105 2 F and the sgain lapsed into come. Intravenous fluids and a second blood transfusion were administered as supportive therapy The resident otolaryngolonot examined the patient that evening He found a scar on the left tympanic membrane, but no evidence of middle ear abseces. Therapy with streptomyem and sulfadiazine was maintained. A blood count at this time revealed hemoglobin 12 Om., red blood cells 3 million white blood cells 10,800 with 05 per cent polymorphonuclears.

By the following morning the patient s tempera ture had fallen to 100 6 F and she again reguined consciousness and appeared to be quite rational A spinal tap was performed again (August 12) At this time only 100 000 units of streptomyon in 10 cc. of saline were administered intrathecally in view of the fall in blood pressure following the larger dose the previous day No untoward reaction was noted at this time. The laboratory report on this specimen revealed many pur cells, but no organisms were seen On the morning of August 13 1045 100 000 units of streptomyon again were injected intrathecally without reaction. The patients temperature at this time varied at about 102 F. The report on the spinal fluid specimen showed evidence that the infectious process was subsiding Culture and smear were negative The spinal fluid sugar however was less than 10 mg, per cent, and the total protein reached a peak of 443 mg, per cent. The sulfadianne level was 85 mg per cent. At this time there were no facilities for determining the concentration of streptomycin in the blood

At 8 rm on the evening of August 14 the pa tient had a shaking chill and sweated profusely 11011 had a shaning cum and sentence protused, By 8.AM the next morning her temperature had fallen to 99 F. The following day a large mass was felt in the lower abdomen. The patient was catheterised and 2500 cc of unne were removed. The analysis of this specimen rovealed no abnormalities At 4 A.M., August 18, the patient again had a severe chill with profuse perspira At this time it was noted that the nuchal rigidity was greatly decreased. A blood culture taken at this time was sterile. The blood level of sulfadiazine was 16 6 mg. per cent. The supply of streptomy ain had been exhausted on the provious day, August 17 but sulfadingine was con-tinued 2.5 Gm. every six hours the patient now taking the medication orally On the following day urinalysis revealed many sulfadiazine crystals present and there were 10 red blood cells per high power field Accordingly sulfadiazine was dis-continued The patients temperature varied be-tween 100 and 101 F

For the remainder of the hospital stay the chief difficulties of the patient were related to her urologic disorder She was unable to void spontaneous and even mobilization did not alleviate this trouble On August 31 she had gross hematuria and a day

later frank pyurla was noted.

A consultation with the urology service was obtained Cystoscopic findings revealed a mild trigonitis and slight contraction of the bladder neck. Tidal drainage was instituted and sulfadiazine therapy was again administered with a dosage of 1 Gm. every four hours with equal parts of sodium bicarbonate After four doses the patient's tem perature rose to 103 F Sulfadiazine was discontinued, as it was felt that the patient had become sensitive to the drug. Penicillin was then administered, 30 000 units every four hours for cleven doses Prostigmine therapy was given also Three days later the patient's unne cleared up almost en-tirely Following removal of the tidal drainage there was temporary incontinence of uring and feces. The patient also complained of frequent desire to vold and cramping sensations in her lower abdomen Culture of the urms on August 17 revealed the presence of staphylococcus aureus streptococcus vindans and B coli. A urine culture done on September 1 revealed B coli and streptococcus fecalis.

Inasmuch as the patient was completely ambula tory and afebrile at this time and because of her atrong desire to return home, she was discharged on September 7 1945, to the care of a urologist. Communication with the attending urologist revealed that only a mild cystitus was present, and this condition soon subsided. Intravenous uron raphy and cyatoscopy failed to reveal any other lesion. The patient was last seen approximately two months after her discharge from Kings County Hospital and appeared to be completely recovered

The accompanying Table I outlines the spinal fluid findings in this case and indicates the latra thecal therapy we employed. Streptomycin was also given intramuscularly in doses of 250 000 units every four hours from August 10 to August

17 1945 when our supply ran out.

TABLE 1.—Spinal Fluid Findings and Intrathecal Therapy

Date 8/7/45	Intrathecal Therapy Penicillin 50 000 µ	Turbidity Cloudy	Smear Gram negative bacilli, many	Culture Type A Friedländer	Total Protein Mg Per Cent 262	Quantitative Sugar Mg. Per Cent Less than 10	Sulfadiazine Level Mg Per Cent
8/8/45	Penicillin 20,000 µ		pus cells	bacilli No Re	eport		
8/10/45	Penicillin 20 000 μ	Cloudy	Gram negative bacilli many pus cells	Type A Friedländer bacilli (after 72 hours)	145	17	10

Discussion

The case herewith reported serves to emphasize certain of the salient features of Friedlander's bacillus meningitis, particularly as observed in the extensive survey of Ransmeier and Major 1 They noted the predisposition of the disease to occur in infants, elderly people, and those with debilitating They also found infections of the middle ear, mastoids, and sinuses in over half the adult Cultures of the spinal fluid from the initial lumbar puncture were positive in 15 of 17 cases Blood cultures were taken in 10 of the cases they Five of these were positive, and these patients died Of the 5 cases with negative cultures, two survived

Our patient was an elderly female, aged 65 had a history of left middle ear disease, presenting clinic evidence of this Culture of the spinal fluid from the initial lumbar puncture was positive for Friedländer bacilli, type A, as was the culture taken the following day Blood cultures were taken four times from this patient, all were negative, except the one taken on admission, which revealed a staphylococcus aureus, considered a contaminant.

It is difficult to assay the value of streptomycin therapy in this case As mentioned previously, several other cases have recovered with sulfonamides alone. The case of Tartakoff, Grynbaum, and LeCompte, like ours, was treated first with sulfadiazine and penicillin This was discontinued because of poor response, and for the last three days of life their patient received only streptomyon Inasmuch as the autopsy revealed nearly healed meningitis, we might postulate that had not pulmonary embolism ended his life, the patient would have recovered from the meningitis Our patient received sulfadiazine throughout the active phase of her meningitis, at first with penicillin, then with streptomycin, and alone for one day after our supply of streptomyon had been exhausted A very high

blood level of sulfadiazine, 166 mg per cent, was attained in this case The concentration of sulfadiazine in the spinal fluid reached a peak of 14.3 mg per cent, a very satisfactory therapeutic level It is possible that our patient might have recovered with sulfadiazine alone On the other hand, the findings of Tartakoff, Grynbaum, and LeCompte, as well as the evidence presented by Heilman,10 and Herrell and Nichols11 on the favorable effect of streptomycin on experimental and clinic infections caused by the Friedlander bacillus, lend support to the thesis that our case was benefited by the use of streptomycin

Conclusions

- A case of Friedländer's bacillus meningitis is reported.
- 2 Streptomycin was employed in part in the treatment of this case, in which recovery ensued
- The value of streptomy can and sulfonamide therapy in relation to this case and several others is discussed
- The author believes that in Friedländer's bacillus meningitis the treatment of choice is streptomycin, possibly in conjunction with the sulfonamides

COMPLETE HEART BLOCK ALTERNATING WITH PARTIAL HEART BLOCK AND NORMAL SINUS RHYTHM IN CORONARY ARTERY DISEASE

WILLIAM B RAWLS, M.D., F.A.C.P. and V. CHARLES ANCONA, M.D., New York City

THE concurrence of complete heart block and coronary occlusion is not common and bears a grave prognosis. It is considered noteworthy to report this case of complete heart block which was discovered when the patient was experiencing anginal pain and transient episodes of distriness following a known episode of coronary occlusion with myocardial infarction. Complete heart block of the first compatible with long life but in the presence of serious coronary artery discusse a prolonged course of nine years from the initial episode of coronary occlusion and seven years from the first determination of complete heart block is remarkable.

Case Report

On January 0 1039 a white patient, aged 54, was even in his home for the first time with chief com plaints of precordial pain, shortness of breath, musea, and comiting after a hearty meal temperature was 09 and the pulse rate 100. The patient presented a history of coronary occlusion in April 1937 with electrocardiographic evidence of posterior myocardial infarction (Fig. 1) However after two days of bed rest and sodation he was able to retain food, felt well and insisted on returning to work On January 14, when he was in the office there were no complaints of shortness of breath or precordial discomfort. On physical examination no significant abnormalities were found. There was normal sums rhythm, no enlargement, the heart counts were of good quality, and no murmurs were leard. The pulse and ventricular rates were 80 and the blood pressure 110 systolic, 70 diastolic. The electrocardiogram revealed a PR interval of 0.28 second and myocardial changes consistent with coromary artery disease.

On subsequent visits the patient was asymptomatic until December 18, 1930, at which time he complained of postprandial precordial pain with shortness of breath On examination there were no objective changes and the pulse rate was 80 with normal sinus rhythm. During the next two weeks, fleeting attacks of dizziness were experienced, and the judient was seen again on December 27. The pulse rate was 33 and auricular contractions could be distinguished from vontricular. An electrocardiogram revealed the prosence of complete heart block (Fig. 2). The patient was started on ½ grain of ephedricular contractions and of polyments of the patient was started on ½ grain of ephedricular contract a day and advised to rest at home for

On January 15 101

On January 15 1040 the electrocardogram revaled a 2 1 auriculoventricular block (Fig. 3) and on April 5 normal sinus rhythm with prolonged PR interval and pulse rate of '4. The uphodrine was descentinced In June 1940 the patient complained of dixticess but no syncope and the pulse varied between 44 and 48 per minute during examination Epicodrine 1/1 grain three times a day was resumed.

Despite his alight diziness the patient continued well with normal sinus rhythm and no symptoms until October 3 1940 when the electrocardiogram again revealed complete heart block. The ephedrine was increased to ½ grain four times

a day, but the pulse and ventricular rates continued at 44 with the patient again experiencing distinces nausen and vomiting. On November 16 1940 the pulse rate wis 80 and the ophedrine was discontinued. On January 4, 1941 the blood pressure was 115 systolic 80 diastolic, pulse rate 44, and 1/s grain cephedrine four times a day was prescribed again.

tinued. On January 4, 1941 the blood pressure was 115 systolic 80 disable, pulse rate 44, and ¹/₂ grain ephedrice four times a day was prescribed again. During examination on May 7 1941 the pulse rate dropped from 80 to 44 and the patient became dizzy, flushed, and faint. On May 23, an electrocardiogram showed a 21 auricultoventricular block, ophedrine was renewed, but the dissiness continued and the pulse rate varied from 30 to 46. The patient continued in this way with cocasional episodes of dizzinosa and in June 1942, another electrocardiogram revealed complete heart block still present. This condition remained permanent, thereafter, as evidenced by electrocardiographic studies, the last being taken on July 23 1946 (Fig. 4.)

The patient's course was uneventful and apparently asymptomatic from this last date until word was received of his sudden death while walking out

doors in December 1946

Discussion

Auriculoventricular block in older individuals as a scrious disorder with a grave prognosis for it is usually indicative of progressive narrowing of the coronary vessels with diminution of blood supply to

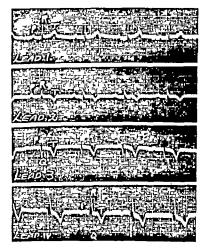

Fig 1. (April 17 1937) Changes of acute coronary artery occlusion involving the posterior aspect of the heart. P R interval 0.22 second

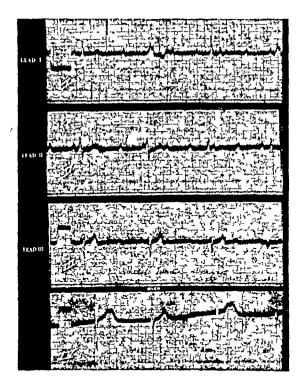

Fig 2 (December 27, 1939) Complete heart block with variable ventricular response

the junctional tissues 12 The fluctuating character of the conduction changes is probably due to the variable supply of blood to these tissues, since collateral circulation may bring recovery to the ischemia of the auriculoventricular node and bundle 3 4 Also, the resolution of inflammatory changes and/or edema in the region of the junctional tissues may account for the transient occurrences of complete and partial heart block and normal sinus rhythm With the progressive narrowing of the coronary vessels, the block may become permanent and, as is not usually true with complete heart block itself, the eventual outlook becomes more serious

The chief blood supply to the auriculoventricular conduction system is direct from the right coronary artery through the ramus septi fibrosi which supplies the superior portion of the interventricular system and sends a branch to the auriculoventricular node, 5 a small percentage is supplied by the circumflex branch of the left coronary vessel

In this patient, the original episode of coronary occlusion was followed by infarction of the posterior ventricular wall which usually is supplied by the posterior descending branch of the right coronary artery. The entire course which followed can be attributed to further embarrassment of the coronary circulation with eventual permanent damage and finally exitus of the patient

It is noteworthy that with these changes in auriculoventricular conduction occurring in a patient who had had a definite coronary occlusion with infarction, the length of survival was slightly

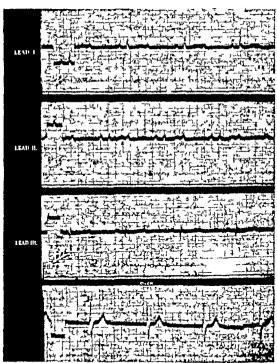

Fig 3 (January 15, 1940) 2 1 partial heart

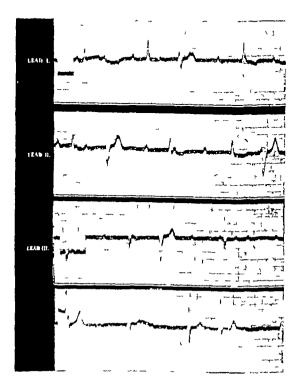

Fig 4. (July 23, 1946) Complete heart block with variable ventricular response

over nine years from the first episode, and seven years from the discovery of complete although transient heart block

Ephedrine was found to be most beneficial in alleviating the episodes of dizziness

Summary

A case of complete heart block, alternating with partial heart block and normal sinus rhythm, is reported in a patient with senous coronary artery disease with a survival of nine years from the initial coronary occlusion and soven years from the discovery of complete heart block.

ILLINOIS SETS UP \$100 000 JOINT FUND TO TRAIN MORE COUNTRY DOCTORS

Full details of a joint \$100,000 plan for financing medical education for farm boys in Illinois to increase the supply of doctors in rural areas were made public recently by the Illinois State Medical Society and the Illinois Agricultumi Association cosponers of the plan The plan is part of a broad program for expanding health care in rural Illinois by establishing regional health councils, recruiting doctors and nurses, and building hospitals.

The medical training plan is based on a fund to

be established by a contribution of \$50,000 cach by the two organizations. The \$100,000 total will then serve as a revolving loan bank from which loans will be made to accepted modical students at the rate of \$1 000 a year to a maximum of \$5 000 perstudent

The program is believed to be the first instance of such cooperation between farm and medical groups to solve their own problems with their own funds

Its importance is emphasized by studies which show that replacement of doctors in downstate fullinois is not occurring that in another ten years more than half the doctors in rural Illinois will be superannuated and that the supply of doctors is directly proportional to the per capita income of predominantly rural countries. The program is designed to meet those specific findings.

ANNOUNCEMENT

To the County Clerks of New York State Gentlemen

This is to notify you that the Board of Regents at a meeting held September 10 1047

COTED, That the determination of the Medical Committee on Grievances in the matter of the application for the revocation of the medical lecence heretofore granted to Benjamin R. Tuppersen York City to accepted and sustained that in compliance with the recommendation of said committee the indorsement of the medical distonation of Physicians and Surgeons of New York City such indorsement made on September 3 1835 constituting his authority to practice medicine in this State be revoked annulled and can

celed and that his registration or registrations as a physician wherever they may appear be ordered annulled and canceled of record and that the Commissioner of Education be empowered and directed to execute for and on behalf of the Board of Regents all orders necessary to accept the determination of said Committee on Grievances and to carry out the terms of this vote.

Dr Tupper was registered for 1947-1948 from 205 West 85th Street, New York City The order of revocation was served on Dr Tupper on October 28 1947

DEVELOPMENTAL ARREST BY INFANTILE TOXOPLASMOSIS

I NEWTON KUGELMASS, M D, New York City

A FOUR-YEAR-OLD white boy, Stephen Arnold H., was brought for examination because of arrested growth and development. He had made no significant gains in height and weight for over two years, never attempted to speak, and had difficulty in seeing even objects brought close to his eyes. The boy ran about purposelessly during the day and tossed about restlessly during the night. He was a first-born, full-term infant, normal delivery. His developmental course was satisfactory from birth, having held his head up at four months, sat up at seven months. His psychomotor responses during infancy indicated normal mental progress.

At about sixteen months of age the baby was taken to a farmhouse in the Catskills for the summer. He continued to thrive until the end of that season Then he suddenly became limp, disoriented, vomited, and developed diarrhea and moderate fever for five days. The condition was treated as an "acute gastroenteritis" which marked the onset of subsequent developmental difficulties. The mother voluntarily elicited the fact that her baby was very fond of a sick puppy with whom he played during most

of his stay on the farm

Some of the manifestations of the acute episode persisted throughout the fall at home in the city. The baby continued to vomit his feedings, pass loose stools filled with mucus, and ran a low-grade fever. He was disinterested in his surroundings, could not be induced to play for any length of time, and became increasingly restless and irritable. All forms of dietary and medical treatment were without avail. The persistent illness was diagnosed as chronic intestinal indigestion, celiac syndrome, intestinal worms, birth injury, and mental deficiency, respectively, by various physicians.

Physical examination in October, 1946, revealed a puny boy of four years, weight 28³/4 pounds, height 3 feet, body build linear His face was pinched, mobile, and tense, his crossed eyes roved restlessly in all directions, his mouth frequently washeld open, his head was retracted with a fixed smile imprinted upon the face The skin was pale, sallow, dry, and devoid of subcutaneous fat He seemed unadjusted to the eye glasses prescribed a year previously for poor

vision and strabismus

The fundus of the right eye revealed an astounding picture. The disk appeared raised and was surrounded by reddish-brown, sharply defined margins, streaks of pigment two to three times the disk diameter. These large, concave, slightly elevated patches of chorioretimitis were located in the lower temporal region of the right fundus and the lower nasal portion of the left. The vitreous was clear and the retina free from edema or hemorrhage. The right pupil was slightly smaller than the left, but both reacted to light. There was a vertical nystagmus in both eyes looking upward, a horizontal nystagmus looking to the left, and a lateral disturbance of movement in the right eye. Other extra-ocular movements were normal

Muscle tone strength and speed of contraction were normal with exception of the right lower extremity which was somewhat spastic. The child responded to pain sensation throughout the body. The corneal, epigastric, hypogastric, patellar, and Achilles reflexes were normal bilaterally I Q (Kuhlmann) was 60 Roentgenographic examination of the skull was normal. The sella was very small with a tendency to bridge. There were small flecks of 1 mm in length observed in the basalganglia. This intracerebral calcification was visualized by stereoroentgenogram of the head. Blood examination was strongly positive of toxoplasma neutralizing antibodies. There was a hypochromic, microcytic anemia and leukopenia but no cosmophilia.

The cue to the diagnosis was the bizarre appearance of the fundus so characteristic of to oplasmic encephalomyelitis. Routine examination of the fundus of all children has its reward in the prompt recognition of this rare disease. The chorioretinitis, macrophthalmos, optic atrophy, spasticity of the extremities, aphasia, and arrested development are characteristic manifestations of the disease. The history of close contact with a sick animal points to the onset of this parasitic infection which leads to mental and developmental retrogression. Positive antibody reaction and presentation of intracerebral calcification are confirmatory of toxoplasmosis.

The disease has a predilection for the central nervous system but the infection is generalized and involves many organs. The relative effects of toxoplasmosis on the central nervous system is magnified in the later stages by the permanent character of the residual lesions. This maintains because of the inability of nerve cells to regenerate, while lesions in other organs tend to heal with little or no residue. The present case reveals the effects of a generalized invasion of tissue cells with resultant impairment of function of the brain, central nervous system, musculature, skin, and blood from clinical evidence

Treatment consisted of a course of sulfapyridine maintaining a blood level of 5–10 mg per cent. Its effectiveness in experimental toxoplasmosis was a possible indication in this subacute parasitic infection. The sulfa was supplemented by parenteral folic acid for the anemia and prostigmin for the spasticity. One million units of penicillin in oil and wax was injected daily for five days when leukemia developed. The boy's appetite improved, the low-grade fever cleared, and the spasticity decreased. His weight increased progressively and the height even more strikingly.

The boy has become interested in his surroundings and is responding more rationally. He is now making normal vowel sounds and attempting the consonants. But the improvement is more apparent than real in comparison with two years of retrogression.

^{*} Acknowledgment is due to E R. Squibb and Sons for providing penicillin to Lederle Laboratories for folio acid and to Hoffmann La Roche, Inc for prostigmine

MEDICAL NEWS

NYU College of Medicine Inaugurates Laboratory of Toxicology

THE Laboratory of Research Toxicology initial unit of the recently inaugurated Institute of Industrial Medicine of the New York University Bellayue Medical Center has been established under

the direction of Dr Norton Nelson.

Dr Nelson, former research associate of the Children's Hospital Research Foundation in Cin cinnati, and assistant professor of biological chemistry at the University of Cincinnati, has been named associate professor of Industrial Medicine.

Graduate blochemist of the University of Cin-cinnati, and later active in research in blochemistry, Dr Nelson took a leading role in that field during World War II at Fort Knov Kentucky where he

was a member of the staff of the Armored Medical Research Laboratory He was discharged as a Lieutenant Colonel of the Sanitary Corps.

The establishment of the laboratory is the cul-mination of plans announced last June, when the Institute was inaugurated, under the leadership of Dr A. A. Lonza, as a training and research unit, dedicated to the problems of industrial medicine At that time it was announced that the Institute would feature the specialized training of experts in industrial medicine through a graduate program, leading to appropriate recognition and research not only in tovicology but industrial physiology and psychology tropical medicine and social medicine.

Set Health Survey for New York City

THE first comprehensive health survey of New York City in twenty years as a basis for the de-Lyork City in twenty years as a besis for the development of a health plan in which all health agencies will be united to cooperate, has been initiated as a joint undertaking of the Health Council of Greater New York and the Public Health Relations Committee of the New York Academy of Medicine, it was announced recently by Dr I Og den Woodruff, president of the Health Council of Greater New York, which is financing the project. The Health Council consists of representatives of 85 health and allied agencies of New York City—Endorsement of the survey came from Dr Harry

Endorsement of the survey came from Dr Harry 8 Mustard, Commissioner of Health who said, The Health Department strongly endorses the undertaking and is prepared to cooperate in every

The survey will be directed by Dr E. H. L. Corwin executive secretary of the Public Health Rola tions Committee of the Academy of Medicine.

The purpose of the survey is to assemble data for use by the long range program committee of the Health Council. Co-chairmen of the program committee are Dr. Howard Reld Craig and Balley, B. Burritt, with Dr. Thomas D. Dublin as associate chairman. Dr. Craig is director of the New York Academy of Medicine, Mr. Burritt is director of the New York Academy of Medicine, Mr. Burritt is director of the New York. National Health Council and Dr Dublin is professor of preventive medicine of the Long Island College of Medicine.

State Charities Approach New Era

THAT the State Charities Aid Association is on the threshold of a new era of service in fields of health and welfare was proclaimed by Dr George Bachr president of the New York Academy of Medicine and member of the Association s Board of Managers at its seventy fifth anniversary meeting December 9 in New York City

The need for an association to express the will of the people of our State and to assist them to under stand and participate effectively in local health and wellare programs is greater today than ever be-

Ging the part played by the Association in helping to establish the State's modern health de-

partment, which has been a model for thirty five years to all the other States of this country! Dr Bachr called attention to recent implementation of the Public Health Laws which now provide grantsin-aid for establishment of properly organized health units This gives the Association a glorious oppor-tunity to stimulate and aid people in all parts of the State to improve administration of public health in their local communities he said.

Approval of the Association s integrated approach to health, mental hygiene, and welfare problems and its increasing emphasis upon prevention recurred in addresses of speakers which included Dr Herman E. Hilleboe, New York State Health Commissioner

To Build Medical Center

THE United States Atomic Energy Commission announced recently that it would spend \$615 000 to build and equip a six-story medical and biological training and research conter on the campus of the University of Rochester at Rochester New York.

The project was recommended by the commissions

sion a committee on biology and modicine. In urg ing the center this committee stated that the com

bination of a large medical school enrollment and

the consequent lack of adequate training and teach-ing facilities was a major obstacle to the program. At the center physicians will receive a postgrad unte training in the treatment of radiation sickness, training in the use of radio-isotopes for tracer studies and therapy and instruction in such topics as phar macology and toxicology of radioactive materials,

Doctors Sign Euthanasia Plea

A PETITION for the legalization of euthanasia, signed by more than 1,000 physicians throughout the state, has been sent to members of the State Legislature, it has been announced by the Euthanasia Society of America and the Committee of 1,776 Physicians for Legalization of Voluntary Euthanasia in New York State

The petition suggests that the State law be amended to "permit voluntary cuthanasia for incurable sufferers, when authorized by a court of record,

upon receipt of a signed and attested petition from the sufferer and after investigation of the case by a medical committee designated by the court "

At present, the petition charged, "many incurable sufferers, facing months of agony, attempt crude, violent means of suicide, while in other cases distraught relatives of hopeless incurables who plead for merciful release secretly put them out of their misery and thereby render themselves liable to prosecution as murderers"

MEETINGS

Past

New York State Association of Public Health Laboratories

Dr Gustav H Klinck, Jr, director of the Cluett Pathological Laboratory of Samaritan Hospital, Troy, gave a report on improved laboratory methods of cancer diagnosis at the midvear meeting of the New York State Association of Public Health Laboratories in Albany on November 7

Others reporting on new methods were Dr George N Papamcolaou, Cornell University Medical Col-lege, and Dr John C McClintock, Albany Medical College Principal speaker at the meeting was Dr Geoffrey Edsall, of the Massachusetts Department of Public Health, who described his state's transfusion program, which provides blood transfusions for the entire population of the state irrespective of financial or geographic hardships

New York Council of Surgeons

Dr Ludwik Gross, chief of the cancer research division, Veterans Administration Hospital, spoke on "Current Trends in Cancer Research" at the meeting sponsored by the New York Council of Surgeons, December 9, at the Parkchester General Hospital, New York City

On December 16, Dr Wilbert Sachs, assistant professor of dermatology at Cornell University Medical School, gave a lecture on cancer of the skın

Saranac Lake Medical Society

"Gastroenterological Aspects of Psychosomatic Medicine" were discussed by Dr Richard I Kilstein, acting chief in gastroenterology at Beth David Hospital, New York City, at the meeting of the Saranac Lake Medical Society held December 10 at the Saranac Laboratory

On December 17, Dr Thomas Hale Ham, assistant professor of medicine, Harvard University Medical School, spoke on "Hemoglobinuria Resulting from Severe Thermal Burns"

Memorial Hospital of Queens

At the clinical conference held December 16 at the Memorial Hospital of Queens, Dr J Hamilton Crawford, director of medicine, Long Island College Hospital, read a paper on "The Treatment of Heart Failure," and a case presentation was made by Dr Theodore Cohn, who spoke on "Anticoagulant Therapy in Clinical Medicine," and Dr I I Greenblatt, who discussed "Biochemical Aspects of Heparin and Dicoumerol"

Eastern New York Eye, Ear, Nose and Throat Association

Dr Donavan McCune, New York City, spoke on 'The Relations Between Ophthalmo-Otolarvngology and Pediatrics" at the meeting of the Eastern New York Eye, Ear, Nose and Throat Association on January 8 in Schenectady

Geneva Academy of Medicine

Postgraduate instruction arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York was held January 15 for the Geneva Academy of Medicine at Geneva Dr Foster Kennedy, professor of clinical medicine at Cornell University Medical College, spoke on "Nervous Conditions Associated with Al-

Future

American Laryngological, Rhinological and Otological Society

The Eastern Section meeting of the American Laryngological, Rhinological and Otological Society will be held January 16 at the Waldorf-Astoria Hotel, New York City, with sessions beginning at

Speakers and their topics include Dr James S Greene, New York City, "Vocal Sequelae to Oral and Nasal Conditions", Dr John A Murtagh, Hanover, New Hampshire, "The Sensitivity of Individual Fibers of the Recurrent Laryngeal Nerve",

Dr Austin T Smith, Philadelphia, Pennsylvania "Orbital Complications Resulting from Lesions of the Sinuses'

Also Dr Edmund P Fowler, Sr, New York City, "The Emotional Factor in Tinnitus Aurium", Dr Will C Spain, New York City, "Importance of Allergy in Ear, Nose and Throat Conditions", Dr Ralph Tompsett, New York City, "Relation of Dosage to Streptomy cin Tovicity," and Drs Edward H Campbell and Douglas McFarlan, Philadelphia, Pennsylvania "Test Findings Before and After the Labvrinth Fenestration Operation" After the Labyrinth Fenestration Operation"

New York Academy of Medicine

A symposium on "The Diagnosis of Viral and Ruckettaial Infections" will be held at the New York Academy of Medicine under the auspices of the Section on Microbiology on January 20 and 30

tion on Microbiology on January 20 and 30
The program will include influenza, Dr Georgo
k. Hirst numps, Dr Werner Henle paittacesislymphogranuloma group of viruses (including tracoma and inclusion blennorrhen) Dr Geoffrey W.
Rake, primary atypical pneumonia Dr Frank L.
Horsiall, Jr , neurotropie virus infections (including
the viral encephaltitides, lymphocytic choriomening
is and poliomyelitis) Dr Jord Casals, herpes virus
Dr T F McNair Scott, rabies, Dr Harald John
son, deague, Dr R. Walter Schlesinger infectious
mononucleosis, Dr John R. Paul opidemic munno,
and serub typhus as well as Q fover Dr Joseph L.
Smadel, Rocky Mountain spotted fever and rickettital pox, Dr Ileraid P Cox, and infectious hepa
ilid, Dr W Paul Havons, Jr

East New York Medical Society

A meeting of the East New York Medical Society will be hold on February 2 at the Kings County Medical Society Building, Brooklyn. Dr. Ira T. Natharson, assistant professor of surgery. Harvard University and director of the Harvard University Cancer Commission, Massachusetts General Hospital, will speak on Results of the Treatment of Cancer. The program will began at 9 r.m.

Geneva Academy of Medicane

Dr Wesley T Pommerenke associate professor of obstetries and gynecology at the University of Rochester School of Medicine and Dentistry will seek on "Dysmenorrhea a a moeiting of the Genera Academy of Medicine to be held February 19 at the Senera Hotel Geneva. The program of

postgraduate instruction was arranged by the Medical Society of the State of New York with the cooperation of the New York State Department of Health

On March 18 a second program will be presented for the Geneva Academy Dr Joseph E. J King, director of neurosurgery at Bellevue and Leuoz Hill hospitals, and instructor in surgery at Cornell Um versity Medical College will speak on Head In juries and Brain Absects.

Both programs will begin at 8 30 i M

Association for the Study of Internal Secretions

The Association for the Study of Internal Secretions announces a postgraduate assembly in endernology to be held in Los Angeles California from February 23 to 28 The faculty is to be composed of outstanding students of endocrinology in the United States and Canada.

Applications may be sent to the chairman of the Committee on Postgraduate Instruction Dr E. Rost Shelton 921 Westwood Boulevard, Los Angules 24 California.

....

American College of Chest Physicians

A postgraduate course in diseases of the chest is to be sponsored by the Penus Ivania Chapter of the American College of Chest Physicians, during the week of March 15 to 20 at the Warwick Hotel Philadelphia, Penusylvania Emphasis in the course will be placed on the newer

Emphasis in the course will be placed on the newer developments in all aspects of diagnosis and treat ment of diseases of the chest. Limited to 30 physicians, the course has a tuttion fee of \$50 for members and \$00 for non-members.

Further information may be secured at the office of the American College of Chest Physicians 500 North Dearborn Street Chicago 10 Illinois.

PERSONALITIES

Honored

Dr. Maurice I Lew! native of Albany and now president of the First Institute of Podiatry at Long resident of the First Institute of Podiary at a re-island University who was guest of honor at a re-eption at the Hotel Pennsylvania, Now York City on December 2 on his ninetieth birthday, a graduate of Albany Medical College former prosident of the Albany County Medical Society Dr. Lewi has headed the Lastitude of the County Medical Society Dr. Lewi has headed the Institute since 1913 and is still active in teaching Dr John R MacElro, a practicing physician at Jonewille for 53 years and Saratoga Constitution of the Constitu County health officer for 35 years, who was honored by approximately 400 residents of the area, which inrades Jonesville Round Lake Maltaville, Hall Moca, Cluton Park, Grooms Cornera, Vischers Ferry Burnt Hills, Ballston Lake and Schenectady who gathered to may tribute to their family docat ceremonies on December 4 at the Jonesville liethodist Church Past president of the State Health Officers Association and the Saratoga County listical Society be was graduated from the Albany Medical College in 1804 Dr Albert Salisbury Hyman, New York who was awarded the Equare Clubber of the lear Gold Key of the Master Mason Paymetan for his outstanding work in Masonry and or in he did medicine, at the 20th annual convention of the Association of Physicians Square Clubs of American Square Club America, December 14 in New York City

Elected

Dr John J Quinlan Troy to his second turn as president of the Renssoler County Boord of Health Dr Bonjamin Grossman, Queens, as grand president of the Association of Physicians Square Clubs of America, for 1948 succeeding Dr M Milton Eckert, the Bronx. Dr Max Helfand, elected president of the Physicians Square Club of New York Dr Henry Rubinstein, president of the Physicians Square Club of Brooklyn Dr Henry G Glazer president of the Physicians Square Club of the Bronx. Dr Maxwell Liebzrman, president of the Physicians Square Club of the Physicians Square S

Speakers

Dr Thomas B Bumbalo Buffalo pediatrician on Protection of Children Against Acute Communicable Diseases at a meeting of the Century Club Niagara Falls, on November 13 Dr Louis Davisson and Dr Jere Lord, Jr New York, at the monthly meeting of the Mount Vernon Medleal Sciency on November 20 Dr Ismes E. Fish Ellis Hospital Schenestady on the status of the general practitioner at a meeting of the Union College Providence Society Dr Arthur Alexander Knapp, New York City on Blinding Diseases of the World —Prevention and Treatment, at the Third Pan-American Ophthalmological Congress in Havana,

Cuba, from January 4 to 10 Dr Harry S Mustard New York City Commissioner of Health, on "Nutrition and Public Health," at the symposium sponsored by the Columbia University School of Public Health on December 11 Dr Peter B Riley, Amsterdam, on child psychology at a meeting of the Daughters of Jacob, Amsterdam Dr Samuel Sanes, chairman of the Cancer Control Committee, Eric County Medical Society, on detection and control of cancer, at a meeting of the Madame Sklodowski-Curie Society, Branch 334, Polish Women's Alliance, Buffalo, on November 18 in commemoration of Madame Curie's birthday

New Offices

Dr Harry F Benjamin, who served in Army Medical Corps and on medical staff of Saratoga Veterans Hospital, general practice in Schenectady Dr Sawyer A Glidden, former medical officer in US Army, general practice in Holley Dr Soltan Mann, general practice in Jeffersonville Dr Paul Rekers, Rochester, general practice in Wal-

worth.

Dr Thomas L Rider, practice of pediatrics in Albany Dr Philip E Rossiter, general practice and genatrics, in Avon, served in US Army Medical Corps as major

COUNTY NEWS

Allegany County

Dr Raymond O Hitchcock, of Alfred, was elected president of the Allegany County Medical Society at the annual meeting in Belmont on November 13 Other officers are Dr J Paul Rems, Belmont, vice-president, Dr Hazen G Chamberlain, Cuba, secretary, Dr Loren E Bly, Cuba, treasurer, and Dr Irwin Felsen, Wellsville, delegate to the State convention

Possible establishment of a cancer clinic in the county was discussed, but no action was taken

Broome County

A three-point attack on rheumatic fever heart disease has been opened by the Broome County Tuberculosis and Public Health Association in conjunction with the Broome County Medical Society A central registry for reporting all cases of rheumatic fever in the county has been established as the first step in the program

The heart program has three aims (1) to discover all rheumatic fever cases by means of the central registry, the first of its kind in the State, (2) to obtain early medical care for persons with symptoms of the disease, (C) to facilitate prevalence studies of rheumatic fever among children and

young adults in the county

Chemung County

Election of officers for 1948 and reports of committees featured the annual meeting of the Chemung County Medical Society, held on December 10 at the Arnot-Ogden Hospital Library, Elmira, with Dr D J Tillou presiding

Officers elected for 1948 are Dr A C Glover, president, Dr G T Connelly, vice-president, Dr H A. Burch, secretary, Dr Earle G Ridall, treasurer, Dr W T Boland, delegate, and Dr Tillou, alternate

Dr J F Lynch, charman of the Cancer Committee, gave a report on the recommendations of the Committee, which included the institution of two cancer detection centers, one in each hospital. The report was unanimously accepted by the members present

Dr L Dichter and Dr Arthur D Smith were elected to membership in the County Society

A letter from Corporation Counsel George Winner was read, requesting doctors not to advise their patients that the city is responsible for lunacy examinations, as the city is entitled to reimbursement wherever possible

Clinton County

Postgraduate instruction, arranged by the Council Committee on Public Health and Education of the State Society for the Clinton County Medical Society will be given on three Thursday nights at the Champlain Valley Hospital Nurses Home, Plattsburg

The program, with speakers and their subjects, includes January 15—"The Treatment of Persistent or Recurrent Dyspnea," Dr Frederick T Schnatz, assistant professor of medicine, University of Buffalo School of Medicine, February 19—"The Treatment of Low Back Pain," Dr George H Marcy, instructor in orthopedic surgery, University of Buffalo School of Medicine, and March 18—"The Treatment of Epigastric Distress Following Meals," Dr A. H Aaron, professor of clinical medicine, University of Buffalo School of Medicine

Dutchess County

Dr Frederick S Wetherell, professor of surgery at Syracuse University, School of Medicine, spoke on "The Relations of the Sympathetic Norvous System to General Medical Problems," at the meeting of the Dutchess County Medical Society on November 12 at the Hudson River State Hospital, Poughkeepsie

Dutchess County's Board of Supervisors was reported to be planning to accept the recommendation of the Dutchess County Medical Society to add a second assistant medical examiner. The proposed 1948 budget included an appropriation for this purpose

Last spring the Medical Society proposed that the board make provision for a second assistant examiner. In order to accomplish this, the Board of Supervisors will have to petition the State Legislature to amend the special Dutchess County Medical Examiner Act, which now provides for a medical examiner and one assistant.

Fulton County

Dr W L Gorham of Albany was guest speaker at the dinner meeting of the Fulton County Medical Society held November 19 in Gloversville His topic was 'Diet and Heart Disease"

The members of the county group voted during the buryings meeting to eccept the the Fulton

This instruction is provided by the State Society with the cooperation of the New York State Department of Health

New York County

The New York County Medical Society representing 6 500 physicians, announced that it had sent a letter to the Board of Estimate urging that body to approve a change in the soning regulations that would permit physicians and dentists to maintain offices in residential districts although they do not live in the same premises.

Dr Harold B Davidson, president, said existing restrictions put an "almost intolerable burden on medical veterans who have returned from military service and are seeking office space to resume prac-tice. Sovere hardship would be imposed on the Public if restrictive zoning regulations were to re-quire physicians to move from their present loca-tions, he stated.

Ottego County

"Recent Advances in Thorapy' was the topic of a keture given by Dr Richard H Lyons professor of medicine, Syracuse University College of Medicine at the meeting of the Otsego County Medical Society held December 17 in Cooperstown

The lecture was postgraduate instruction arranged by the State Society in cooperation with the State Department of Health

Putnam County

Opposing any system of compulsory health insurance members of the Putnam County Medical Society, at their meeting on November 5 in Carmel adopted the following resolution

WHEREAS The members of the Putnam County Medical Society believe that the practice of medicine shall remain a free and independent profession

and,
"Whineas, Experience in other countries indicates
"Whineas, Experience in other countries indicates lowers the scientific and professional standards of the physicians and herewith the quality of medical sorvice, encourages malingering, and becomes a heavy burden on society be it

"Resolved We the members of the Putnam County Medical Society are opposed to any system of compulsory health insurance. We are in favor of greater support to voluntary health insurance plans which have been approved by the medical

profession.

Queens County

Dr Elaine Ralli, attending physician Bellevue and Goldwater Memorial hospitals, and associate physician in medicane, New York University Hospital, spoke on 'The Modern Management of Curhosis' at a meeting of the Queens County Medical Society held December 12 at the headquarters in Forest Hills.

Plans for the coming year were discussed at the meeting, and the members reaffirmed their interest in the rising cost of medical care and announced their approval of the United Medical Service and Blue Cross Plan to help defray these costs

A rising vote of thanks was given the retiring

president. Dr E Hall Kline

Schenectady County

Two sessions of postgraduate instruction have been planned for the Schenectady County Medical Society by the State Society in cooperation with the State Department of Health, and are being held at Ellis Hospital, Schenectady on Tuesday nights at

On January 6, Dr Frank Glenn, professor of surgery at the Cornell University Medical College, New York, spoke on "Surgical Treatment of Biliary Tract

On February 3, Dr Richard H Lyons, professor of medicine at Syracuse University College of Medicine, will speak on "Management of Hyperthyroid-ism."

Seneca County

The Seneca County Medical Society has suggested to the Board of Supervisors of the county that Seneca County should have one coroner who also would be the district attorney of the county suggestion was made to the county governing body at its fall session at Waterloo by a delegation from the Medical Society consisting of Dr E P Mc-Wayne, Fayette, Dr David Koch, Seneca Falls, and Dr Charles Smith, Waterloo

The physicians, in making the suggestion that legislation should be adopted providing for this proposed set-up, pointed out that this would result in more efficiency in the county Instead of having four coroners, as at present, who call in the district attorney on many of their cases, the doctors said it would be more feasible to have one coroner who would at the same time be the district attorney

No action was taken on the suggestion, and the supervisors stated that special State legislation would have to be passed to bring about such an arrangement

Steuben County

Dr Vrooman S Higby, Bath, was elected president of the Steuben County Medical Society at the annual meeting on November 13 in Bath, succeeding Dr L A Thomas, Painted Post, retiring president Also elected to office were Dr C E Patti, Hor-

nell, vice-president, Dr Rudolph J Shafer, Corning. secretary-treasurer, Dr W J Tracy, Hornell, dele-

gate, and Dr Thomas, alternate

Three members of the medical staff of the Bath Veterans Administration Center, \mathbf{Drs} Schwartz, A J Giacomini, and Cloyse T Hall, were elected to membership

One of the last units in the State to take the move. the Steuben County Medical Society voted to adopt the Blue Shield Medical Plan of Insurance, Dr R J Shafer, Corning, secretary, has announced plan is owned and operated exclusively by physicians and its headquarters will be in Syracuse, Dr. Shafer stated

Suffolk County

Dr Wilbur Stakes, Patchogue, was elected president of the Suffolk County Medical Society at the 142nd annual meeting held November 5 in Bright-Dr William Carhart, East Islip, and Dr Perry Horenstein, Bellport, were elected vice-presidents

For the 25th consecutive year Dr E P Kolb, Holtsville, was elected secretary, while Dr Grover A. Silliman, Saville, was named to his 20th term as

treasurer

Tompkins County

The annual meeting of the Tompkins County Medical Society was held at Biggs Memorial Hospital on December 15 Officers elected for 1948 were Dr H W Ferns, president, Dr C S Wallace, vice-president, and Dr R Douglass, secretarytreasurer

At the scientific session conducted in connection with the meeting, Dr Leonard A Maynard, director of the School of Nutrition, Cornell University, Ithaca, spoke on "Some Recent Developments in

Nutrition of Interest to Physicians"

Yates County

A resolution endorsing the campaign to raise \$150,000 for a new wing and modernization for Soldiers and Sailors Memorial Hospital, Penn Yan, has been adopted by members of the Yates County Medical Society, and the campaign recommended to all citizens of Yates County as one worthy of their financial and wholehearted support

Note the dates for the Annual Meeting of the Medical Society of the State of New York-

May 17 to 21, 1948, Hotel Pennsylvania, New York City

HOSPITAL NEWS

State Hospital Program Pushed

SUPPORT of Mayor O Dwyer's program for modernizing New York City hospitals was urged by Commissioner of Hospitals Edward M. Bernecker speaking at a meeting of the State Charities Aid

Association in December

Dr Bernecker commended the Association for its constructive criticism and recalled that one of its first achievements was a study of Bellevue Hospital in 1872, which led to the founding of the first hospital

school of nursing in the country

To meet our crying need for more hospital beds, a program for spending \$150,000 000 has been propared as part of a \$350 000 000 long-range plan, Dr Bernecker related. He added that fulfillment depended upon public support of the legislative program presented by Mayor O Dwyer

Herman E. Hilleboc Commissioner of the State Department of Health, declared that current diffi culties were obsolete plant and lack of facilities.

This is the first time in my recollection that we have been able to dare to tall the truth about how desper ate our situation is, he said Not only did Mayor O Dwyer receive our reports and suggestions and criticism in the spirit in which they were made, but he gave them to the public

Dr Hilleboe announced a plan for streamlining administration of his department. He said five branch offices would be established in cities to replace eighteen district offices and creation of more

county public health agencies would be encouraged Other speakers included Dr William A. Brumfield director of the division of syphilis control of the btate Department of Health, Dr Everett Case president of Colgate University, Mrs. Charles president of Colgate University, Mrs. Charles Dana Gibson, chairman of the child placing and adoption committee of the Charitres Aid Associa tion, and Dr George Bachr president of the New York Academy of Medicine

Significance of Birth Rate in Hospital Planning

WHILE 1917 was being acclaimed as a record year for babies and hospitals were urged to expand for other lng years ahead the birth rate quietly passed its peak and began the inevitable downward trend toward prewar levels, the Hospital Council of Greater New York said in a recent bulletin emphasizing the algolficance of the birth rate in hospital planning.

Stating that a total of 4,485 maternity care beds can meet the known needs of New York City resi dents by 1050 the Council recommended the distribution of beds borough by borough through coordinated hospital planning to provide facilities in relation to the needs of the people and to avoid waste in construction and maintenance of facilities of which there (would otherwise) be only fractional

Analyzing the birth rate for New York City as a whole, the Council pointed out that although the rate was very high late in 1946 and early in 1947 the

decline began during March of this year and that since August the number of births per week had actually been lower than for the corresponding week The Council has stated in its Master Plan ın 1946 for Hospitals and Related Facilities for New York City that long time trends in buth rates, etc., altered by changes which occurred during the war and in the carly postwar period, will again be operative by 1050

It is apparent, the Council said, 'that existing facilities are not distributed in relation to population Manhattan, with only 24 per cent of the population, has 38 1 per cent of the beds for maternity care. The Bronx has 19 per cent of the population and only 13.2 per cent of the available beds In Brook lyn the percentage of existing beds approximates the ratio for the population of Brooklyn. Queens, ox pected to have 20 per cent of the total population in New York City by 1950 now has only 10 9 per cent of the total beds available for maternity care

New Clinic Opened for Child Guidance

THE first child guidance clinic for short therapy treatment opened in December at Both David Hospital, Now York City under the direction of Dr Ernest Harms The new clinic which is open on Thursdays only will serve as a pattern for a series of similar ones he plans to develop for social agencies and settlement houses throughout the city

Eighty per cent of the average agency cases brought to the attention of the psychiatrist can be solved by the short therapy method Dr Harms

The director of the Beth David children's ad luminent clinic and author of the recently published Handbook of Child Guidance characterized the clinic work as preventive mental health work where neuroses which may become severe in later life can be diagnosed and treated in time.

Declaring psychoanalysis impractical for the average urban child with neurosis which can be cured by alsorier treatment he said that psychoanalysis is too long and too expensive. The clinic, he ex plained, will serve as a clearing house with severe cases referred for proper treatment.

Types of cases which can be treated at the clinic are truancy mild prodelinquency slight fear neurosis sleeping disturbances, and light neurotic symptoms, he said Pediatrics, psychology and physical examinations are developed, and Dr. Harms has prepared a new type of case-history chart where all these facts are reported on one page

Beth Israel Hospital Establishes Rehabilitation Clinic

BETH Israel Hospital in New York City has announced the establishment of a rehabilitation clinic especially designed for the treatment of patients disabled by cerebrovascular accidents and allied disorders. The purpose will be to treat and train such individuals, the majority of whom would be in the upper age brackets, and who also suffer from hardening of the arteries and high blood pressure, to live useful lives within the limits of their disability

The rehabilitation clinic eventually plans to broaden the program to include other types of disability, but recognizing the urgency of the problem and the immediate need in the beginning, cases will be limited to those patients who have had strokes of anonless or similar disorders

apoplexy or similar disorders

Dr Maxwell S Frank, director of the hospital, stated, "It is our plan to expand the rehabilitation clinic as soon as space becomes available, because in the light of the recent experience in the armed forces and the Veterans Administration, we recognize rehabilitation to be an integral part of medical care" At the present time admission to the new service will be limited to ward and clinic patients

NYU Sets Up Institute for Rehabilitation

THE Institute of Rehabilitation, one of the principal units of the proposed New York University-Bellevue Medical Center, established interim quarters on January 1 at 325-327 East Thuy-eighth Street, Chancellor Harry Woodburn Chase, of New York University, announced in December

The temporary quarters were made possible by the Milbank Memorial Fund and a \$25,000 gift from

Bernard Baruch, Chancellor Chase said The institute, a hospital and outpatient clinic maintained by the University's College of Medicine, will receive patients as soon as necessary changes can be made

A campaign to raise \$2,500,000 for a permanent home for the institute is a part of the current appeal for \$15,575,000 for a new university section of the New York University-Bellevue Medical Center

NEWS NOTES

Sydenham Hospital announced plans for a new building costing \$7,500,000 which will house the present hospital, a research Institute for Medical and Related Sciences and an Institute for Community Relations

The Arnot-Ogden Hospital, the Shepard Relief Hospital of Montour Falls, and the Seneca Falls Hospital were admitted to full membership at the council session

A gift of \$50,000 from the Irving Geist Foundation for the construction of a therapeutic swimming pool for New York University was received by the New York University-Bellevue Medical Center The pool will be built in the institute of Rehabilitation and Physical Medicine, which will be part of the center's new university section

The board of directors of the Council of Rochester Regional Hospitals and the council's medical conference have voted to give full cooperation to the Red Cross in the establishment of a blood bank. The bank would serve eleven counties in Southern-Central New York, including Cheming Thomas R White, Rochester, president of the council and

R White, Rochester, president of the council and charman of the blood bank committee, said that the proposal had been thoroughly studied by the council and expressed the belief that the bank is necessary to provide adequate hospital and medical care in the area

Delaware County which has a 29-bed county hospital at Sidney is being urged, through its board of supervisors, to increase the capacity by a 21-bed extension to the building

The State Department of Health and County Planning Commission recently filed such a report with the supervisor board.

Plans for the creation of a ward at Ellis Hospital, in Schenectady, for the temporary detention of mentally-ill persons have been discussed at a meeting of hospital, city, and state authorities in the hospital

The meeting covered medical and legal aspects of the proposed facilities Dr Arthur W Pense, deputy commissioner, and Dr Walter M Pamphilon, assistant commissioner, will represent the state department of mental hygiene in the discussions Plans must be approved by this state agency before the local program can begin, it was stated

PERSONALITIES

the Winter Edition of The Distaff, official publication
of the Woman's Auxiliary of the State Society, has
been distributed to each member, according to Mrs Lee R. Sanborn, editor Copies were mailed on December 16, 1947

In addition to the comments of Dr Bauer and

Mrs Pohlmann, the issue includes reports from the eight District Councilors, an account of the Broome County Health Fair, a special column entitled "Auxiliary Highlights," and several other news items A list of dates for coming events is also given

Members who have not received their copies are requested to write Mrs Thomas D'Angelo, 157-05 Rose Avenue, Flushing, Long Island, New York, who will check to make certain that the name is on the mailing list

COUNTY NEWS

Broome County

Collegiate bridge was played by members of the Broome County Medical Society Auxiliary at a dessert luncheon, November 11, in Endicott Mrs Frank G Moore was general chairman, assisted by Mrs Frank G Baston and Mrs John Kalb Vincent Maddi was in charge of reservations, and Mrs Wilber J Kerr was in charge of the tourney At the business session, Mrs Windsor R. Smith,

president, presided

Columbia County

Dr Leonard D Carpenter, Germantown, president-elect of the Columbia County Medical Society, was guest speaker at the November meeting of the

Woman's Auxiliary, on the topic of medical insurance Mrs Ralph F Spencer, president, announced that members had been invited to attend the midyear luncheon meeting of the Albany County Auxiliary, December 10, at the Albany Country Club when Mrs Harry F Pohlmann, Middletown, State Auxiliary president, was guest of honor

Erre County

The Eric County Medical Society's Auxiliary is now in its second year of establishing and maintaining a scholarship loan fund for student nurses. This year the Auxiliary voted an additional amount, making a total of \$700, for two complete scholarships at the University of Buffalo

Due to the acute shortage of nurses, the Auxiliary voted in 1946 to establish this project, and formed a committee which met with executives of the New The Association York State Nurses' Association recommended that the fund be maintained as a loan rather than a free scholarship, and offered its services

in contacting applicants Each spring all schools of nursing are notified that the loans are available and a notice is sent to the Bulletin of the Nursing Association To date, the Auviliary has found it advisable to interview only girls who have been tentatively accepted by some school of nursing

Ene County now has four students in training, and the reports of their progress are most gratifying

Oneida County

Discussing "Functions and Purposes of the Auxiliary," Mr Thomas E Walsh, field representative of the Medical Society of the State of New York, addressed the Woman's Auxiliary of the Oneida County Medical Society at a luncheon meeting, November 25, in Oriskany

Plans were made for a dance for members and

their husbands in January

Mrs Philip L Turner, president of the Oneida Mrs Philip L Turner, president of the Uneida County Auxiliary, has been chosen by the Business and Professional Women's Club of Utica as the "Woman of the Year" and received their 1947 Scroll of Honor Mrs Turner has been active in the Players' Club, the Y W C A., the Newcomers' Club which she organized during the war, in musical circles and in church work, and lately in forming a discussion group for young methers. discussion group for young mothers

Oswego County

Sponsored by the Woman's Auxiliary to the Oswego County Medical Society, a Charity Ball was

held at the Hotel Pontiac, Oswego, on December 27 Auxiliary members are engaged in various activities in their communities, it is reported. Women of Oswego have been working on a campaign to raise money for a new hospital in that city In Fulton, 452 children were inoculated at the diphtheria clinic in October, with Miss A C Culkin, an Auxiliary associate member, in charge Many members worked on their local Community Chest drives

President of the Oswego County unit is Mrs A J

Cincotta, Fulton.

St. Lawrence County

The first anniversary of the Woman's Auxiliary of the St Lawrence County Medical Society was celebrated at the November meeting in Ogdensburg Mrs John E Free, president, was in charge, and Mrs John S H Mason, councilor of the Fifth District, was guest speaker

Laboratory Manual of Microbiology for Nurses By Elizabeth S Gill, B S, and James T Culbertson, Ph D Quarto of 116 pages, illustrated New York, G P Putnam's Sons, 1947 Paper, \$1 50

REVIEWED

Diseases of the Chest. Diagnosis and Treatment By Archibald Reynolds Judd, M D Octavo of 608 pages, illustrated Philadelphia, F A Davis Co, 1947 Cloth, \$900

About half this volume is devoted to tuberculosis, the rest to pulmonary abscess, bronchiectasis, pleurisy, silicosis, and other nontuberculous affections. It is accurate and reasonably up to date but sketchy. In a different format, it would have made a good compendium.

The style is undistinguished except for an almost obsessive use of unnecessary quotation marks. The printing is good and the illustrations and the index

are excellent

MILTON PLOTZ

The 1946 Year Book of Endocrinology, Metabolism and Nutrition Endocrinology edited by Willard O Thompson, M D, Metabolism and Nutrition edited by Tom D Spies, M D Duodecimo of 573 pages, illustrated Chicago, Yearbook Publishers, 1947 Cloth, \$3.75

This edition of the Year Book, as most of its predecessors, contains a wealth of valuable case reports and offers a stimulating wealth of information about the newer trends in endocrinology. The comments of the editor are short and usually to the point

MAX A GOLDZIEHER

Spezielle Chirurgische Therapie für Studierende und Arzte By Max Saegesser, M D Octavo of 884 pages, illustrated Bern (Switzerland), Medizimischer Verlag Hans Huber, 1946 \$24

This book is intended for the use of the medical student and the general practitioner—Exact surgical indications and technic are especially stressed

Although most of the chapters are well covered, accomplishments in surgical treatment of cancer of the esophagus, of congenital anomalies of the heart, and of the large cardiac vessels are not mentioned Conversely, description of operative procedures in the abdominal cavity is much too detailed. The chapters on fractures and dislocations are excellent

Woman s Auxiliary

[Continued from page 220]

Schoharte County

On October 14 the Scholiane County Medical Sodety Auxiliary was organized under the direction of Virs. Herman W Galster Scotia, State chairman of organization making a total of 40 organized units in the State.

Suffolk County

A scholarship for a student nurse will be sponsored as this year's project by members of the Suffolk County Auxiliary Virs Wyron Hafer president, has announced.

To raise funds for this, a benefit dance was held on December 27 at the Riviera Beach Club Brightwaters.

Salliven County

Briming the final total of organized units to 41 the Sulivan County Auxiliary was reformed on Noember 14 as an active organization. A request for 100 per cent New York State organization has been made by Mrs. Davis B Allman national chairman.

Tompkins County

In its first year of existence the Tompkins County Auxiliary has completed an active program, with their immediate aim to educate members in regard to current happenings in health circles.

In October a symposium on "The Present State of the Proposed Health Center" was presented at the regular meeting. The County Health Commission, its outline, set-up and scope was discussed at the November seesion and in January Dr Norman Moore will talk on social medicine.

Alra. Frederick Beck is president of the Tompkins County Auriliary

Some things you should know about the common cold

Na 209 in a series of messages from Parke Davis & Co. on the importance of prompt and proper medical care

OST FEORIE in the United States and Canada have two or more colds a year, each lasting about two weeks and causing a considerable amount of stuffy discomfort.

The danger of the common cold lies mainly in the other infections that may follow after it. For a cold lessens your resistance, and is likely to pave the way for other, more serious, respiratory ailments

Sinusitus, ear infections, bronchitis, and the various forms of pneumonia are frequently ushered in by a cold. Pneumonia, particularly, is likely to attack a person who is overtired, or run-down because of a severe cold

True, many of these respiratory diseases are not as dangerous as they used to be. (Modern infection fighting drugs—such as penicillin and the sulpha drugs—offer highly effective treatment for many cases)

But, of course, it is always better to prevent a serious illness whenever possible.

If you have a cold, it's just good sense to stay away

from people, to avoid spreading the infection, and to get plenty of rest-in bed if possible.

If your cold is accompanied by fever, a persistent cough, or a pain in the chest, face, or ear, call your doctor at once.

The sooner you seek his help, the more he can do to help you avoid a long and serious illness

And, in the case of children, an early examination may disclose that what appears to be only a cold may instead be a starting symptom of an entirely different disease, such as measles or scarlet fever

SEE YOUR DOCTOR. Never to the foolhards experiment of dosing yourself Your doctor's treatment of one illness may be quite different from his treatment of another illness which appears the same to you.

Let your doctor diagnose vour ailments. Let lum decide what treatment is best for your particular case. Then follow his instructions to the letter His advice is the only advice you should take on any question that concerns your health.

Experience is the Best Teacher

JOHN HUGHES BENNETT (1812-1875) proved it in histology

Bennett's experiences, gained by linking physiology with clinical medicine, led him to institute the practical study of histology to recognize the medicinal value of cod liver oil, and to be the first to describe the blood condition leukemia — Bennett's disease.

Yes! And experience is the best teacher in smoking, too!

DURING the wartime cigarette shortage, people smoked many different brands—any brand they could get. And as they smoked—they naturally compared the different brands for taste, for mildness, for coolness for all round smoking enjoyment. More and more smokers found from the experience of those comparisons that Camels suit them best.

Result? More people are smoking Camels than

According to a Nationwide survey:

More Doctors Smoke CAMELS than any other cigarette

Three nationally known independent research organizations asked 111,591 door rs — in every branch of medicino—to name the cigarctic they maked More doctors named in a set of the control of the cigarctic and the property of the control of the cont

The New Oral Method

of Penicillin Administration

to Infants and Children

Soluble Tablets Crystalline Penicillin provide a new and convenient means of instituting penicillin therapy in infants and young children. These small tablets of crystalline penicillin G potassium are composed entirely of penicillin, and contain neither binder nor excipient. Readily soluble, they may be administered with the milk formula to infants, or dissolved in milk or water before being given to young children. Thus the need for hypodermic injection is obviated in the treatment of many penicillin-responsive infections and administration can be made by the mother. Their presence in solution produces no discernible alteration in taste. Dosage, 100,000 units or more every 3 to 4 hours.

Each Soluble Tablet Crystalline Penicillin contains 50,000 units and is individually sealed in aluminum foil Supplied in boxes of 24 tablets and available at all pharmacies

Baybank Presents –

for local application to burns and wounds

bland, non-adherent,

First developed exclusively for our Armed Forces during World War II "Vascline" Sterile Petrolatum Gause Dressings are now made available to the civilian medical profession for first aid and definitive local therapy of burns

as a bland dressing and protective covering for numerous purposes and as a wound pack. Today in both military and civilian circles the superiority of petrolatum applications is renerally conceded -- because they are bland and non-adherent, and appear to permit more rapid healing than tissue-devitalizing escharotics

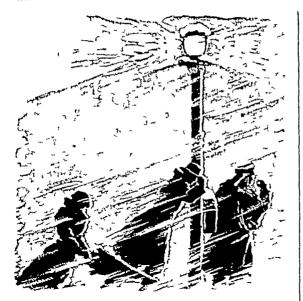

Baybank Dressings are strips of sterile, finemeshed, (44/36) absorbent cotton gauxe uniformly saturated in a sterile atmosphere with sterilized white petroleum jelly accordion folded. and heat-sealed in moisture-proof aluminum foil envelopes—they are thus dependably sterile protected against extremes of temperature and humidity and ready for immediate use anywhere.

any time. When drawn to full length, they are 3 x 36 inches-supplied 6 envelopes to the box. Handy for physicians bags, first aid kits, etc.

Over A Quarter Century Serving Physicians

What does S-M-A stand for?

S-M-A ? A certain baby (wise beyond his years) explains those in triguing letters "Sure Merits Approval"

But the baby's physician and his colleagues say, "S-M A? Why, it stands for Several Major Advantages" Some of those advantages which appeal especially to doctors are shown in the comparative analysis below

S-M-A AND MOTHER'S MILK ARE THE SAME IN ALL THESE IMPORTANT RESPECTS

FAT—S-M A fat is like breast milk fat The same Reichert Meissel iodine, saponification and Polenske numbers, same retractive index and melting point.

CARBOHYDRATE-Lactose only

PROTEIN—Low buffer action, low curd tension same amino acids essential to growth

VITAMINS—S-M 1 contains all the essential vitamins except vitamin C—a requirement satisfied by regular orange or tomato juice supplement.

MINERALS—S-M A contains all the minerals known to be easen tial for babies. Calcium and phosphorus are in proper balance; iron content is ten times that of human milk.

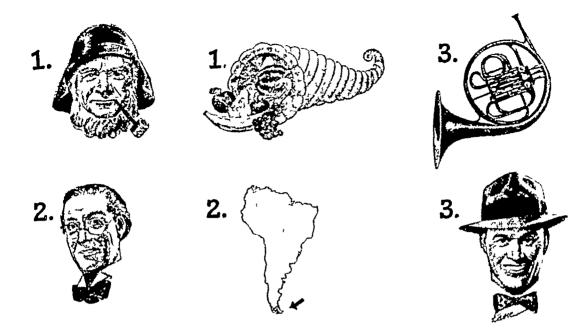

S-M A® is antirachitic and is as easily digested as breast milk S M A infants develop firm tissue turgor and their nutritional history resembles that of breast fed infants

When they start on cereal Cerol® has all nutritional ad vantages plus that dehenous papaya fruit flavor

Match up the people and the horns

(It may mean money to you!)

The first two, of course, are very easy

The sea captain (1) goes with Cape Horn (2), and the musician (2) with the French horn (3)

That leaves the Average American (3) matched up with the Horn of Plenty (1)

As such an American, you'd like that to be true, wouldn't you?

It can be—and will be—for millions of Americans who, today, are putting money regularly into U S Savings Bonds

In ten years, as the Bonds mature, these millions will find that they have truly created a Horn of Plenty for themselves! For they'll get back \$4 00 for every \$3 00 they're putting in today!

There are now two easy, automatic ways to buy U S Savings Bonds regularly

The Payroll Savings Plan for men and women on payrolls, the Bond-A-Month Plan for those not on payrolls but who have a bank checking account

If you're not on one of these plans, get started today Your employer or banker will give you all the details

Let U S Savings Bonds fill up your personal Horn of Plenty for the years to come!

Automatic saving is <u>sure</u> saving ... U.S. Savings Bonds

Public Education Needed

Dr Louis H Bauer, president of the State Society, has urged recently in a letter to the membership that each component county society establish, if it has not already done so, a committee on public education

The purpose of this committee would be to provide for the establishment by each county society of its own speakers' group and thereby make available at all times a roster of doctors who are prepared to talk on subjects pertaining to medicine in any of its social, economic, or political aspects. These doctors should be prepared to speak either on their own initiative or at the request of any of the various lay groups within the community

Public education is the most important single thing any county society can accomplish I can think of no better way in which the county society can achieve this than for the Committee on Public Education first, to train and then make available speakers who can give our profession s views on timely topics.

We believe in the private practice of medicine as the proper way to deliver medical care. For certain aspects of medical care, public funds are available If we are to protect the system of private medical care—if we are to insure proper allocation and administration of public funds then the county secrety must provide leadership Otherwise, the public will turn elsewhere for it.

It is perhaps unfortunate that the training of the average man of medicine is not such as to develop many good public speakers. This applies not only to those who address lay groups but also to speakers before professional audiences.

Many will have remarked at medical meetings the obvious difficulty some doctors have in expressing themselves fluently and easily, even when the content of their remarks concerns purely professional matters with which they are thoroughly familiar

In speaking to lay groups, doctors usually find their ordinary public address deficiencies somewhat magnified by the heterogeneous background of their listeners. Medical terms must be paraphrased or translated into ordinary speech. Also, in such groups the doctor may find himself pitted against a practiced public speaker, to the doctor's disadvantage and embarrassment.

But these difficulties can be overcome One recalls the Hibernian who was asked "Hand whether he could play the fiddle one over," says he, "and we'll damn soon find out!" Audiences can be counted on to make allowances if a speaker is obviously sincere, if he has an enthusiasm for his subject, and if he will cultivate the art of persuasion

Savs Dr Bauer

I believe the establishment of a Public Education Committee is most important this committee can find a number of adequately trained men who will go out and discuss these topics, the speakers will so establish the local county society in the minds of the public that the people, and as a consequence both State and local legislators, will automatically turn to the Society for the answer to any medical prob-Likewise, they will turn to the Society for help in finding a solution to any social. economic, or legislative question that touches upon our activities as members of the medical profession

If the medical profession expects the pub-

lic to look to it for information, the doctors. as Dr Bauer states, must train themselves And moreover, to supply it in to supply it attractive and comprehensible form haps the profession is deficient in training for public speaking Let this fact be recognized as a first step in correcting the omission one can speak for the medical profession as authoritatively as the doctors If it is now imperative that doctors prepare themselves to speak to groups of the public, it can be done, because it has to be done

We might suggest that training be commenced in the medical schools with a view to the better fulfillment of medicine's obligation in the future In the meantime, should you desire any information or assistance in planning the creation of a Committee on Public Education and Speakers' Bureau, Dr Bauer suggests that you contact our field representative, Mr Thomas E Walsh, of the Public Relations Bureau at the State Society's office, 292 Madison Avenue, New York, 17, New York

How to Choose a Doctor

Attracted by a full-page advertisement in the New York Times we have just read a most interesting article in the Woman's Home Companion under the above title 2

Every family in the country is advised in the article to get itself a family doctor in ad-Excellent counsel vance of illness and how will the family find one? By applying to the best hospital in town 3 Observe from now on the ever-constant narrowing of the medical field from which the public may seek advice and guidance, if the procedure recommended is followed

Some time ago in New York City there were four "best hospitals in town" Once a year, New York, Presbyterian, Roosevelt, and St Luke's achieved sufficient unity to offer combined examinations for the selection of interns For three days out of the year the four institutions conceded parity

¹ New York Times Oct. 25 1947 ² Albert Deutsch How to Pick a Doctor Home Companion November 1947, p 38 ³ Italics ours.—Ed

Woman s

Conditions have now changed of the Big Four in New York City the field has been narrowed down by two of the Big Four attracting to themselves other institutions, and, with the aid of medical schools, becoming medical centers These two great institutions stand like castles on the Rhine, dominating the approaches to the George Washington and Queensboro bridges

Smaller, most respectable hospitals, with their own traditions of professional excellence, are being absorbed into the maws of these octopi The good reason for their absorption is that it makes them so much more convenient for teaching purposes solidations also cut down the numbers on their staffs and tend to convert independent institutions which formerly fostered healthy rivalries into large conformist-monopolies

Mr Deutsch, the author of the article, lays much stress on picking a doctor who is a Fellow of the American College of Physicians or Surgeons, or is a diplomate of the fifteen Specialty Boards. The field thus is narrowed further

The best hospitals are tending increasingly to be staffed by full- or part-time professors in the medical schools with which they are affiliated, they soon achieve a certain deschment from the problems of the ordinary patient and the general practitioner. Indeed, some of them have never engaged in private practice. Thus they are hardly qualified as general practitioners. Many don't want to treat patients outside the hospital, and some probably wouldn't know how to if they did

Mr Deutsch's article is superficially so good, so plausible, so sweetly reasonable that it gave us to think of the matters which are not mentioned in it but which profoundly affect the result and of which the public should also be informed in choosing a doctor All is not necessarily gold that glitters.

In the plausible scheme propounded by Mr Deutsch, the humble but necessary county medical societies seem to have been entirely overlooked Why? These exist Why should not the public for which Mr Deutsch writes be informed, when choosing a doctor, that a call to the county medical society could be informative and helpful?

Presidents, past, present, and future, of county medical societies are men of broad human interest and understanding. With out having made a very wide acquaintance with all ranks of their profession they could scarcely have been elected to their offices. They are not made independent of human

problems by full-time salaries. They can understand why some very good doctors are not accepted, or may have been rejected by the conformists of the staffs of the best hospitals.

We think the public and the medical profession would both be better off if inquiring patients were referred to a panel of doctors possibly selected locally by such men, as well as to the informational facilities of the best hospital in town We see no reason to bypass entirely the widespread and readily available institutions of established medicine

There is an increasing tendency, among nonmedical writers for the public, to propose new ideas to improve the lot of the citizentaxpayer in his relation to the allegedly reactionary medical profession. We seem to remember a publication of the Public Relations Bureau of the Medical Society of the State of New York in 1942, When Doctors Are Rationed 4 Chapter XVII, p 241, is entitled "How to Choose a Doctor" and was written during the last war at the instigation of the medical profession of this State The book was distributed widely, but apparently not widely enough. Sometimes the more recent nonmedical writers overlook the prior efforts of the medical profession to solve for the public problems which are only apparently new and which are susceptible of other solutions than those advocated by the apostles of neo-liberalism-whatever that is at the moment

By Dwight Anderson and Margaret Baylous, Coward-McCann Inc. New York, 1942.

The Evaluation of Male Fertility

The propaganda wave for contraception which has been so prominent in recent years seems to be in the process of being halted by the thought that more attention should be accorded to relief of sterility as a balancing factor. All of this talk about "voluntary parenthood," "baby spacing," and other popular social measures so widely discussed in lay magasines seems about to be stopped by the thought that perhaps we have gone too far in proventive measures, that perhaps we should seek to increase rather than diminish the number of babies

It is encouraging to note that the birth rate as a matter of fact, has reached a high figure during these past few years. Still there are many barren marriages, and an interest has developed even among service men who are worried because they have no progeny.

Many of these returning servicemen fear that they have acquired sterility as the result of their war experiences, for it is no longer believed that the wife is always at fault As G A. Humphreys has said well in a recent article, "The soldier of yesterday is the father of tomorrow in a hurry to make up for lost time "1"

The causes of sterility of wartime origin may be remote, such as cord injuries or diseases of the genital tract However, accidents similar to those of civilian life, plus lacerating and penetrating wounds, were well cared for with plastic surgery Scrotal damage with shrapnel could be severe without disrupting the continuity of the spermatic passages, and retained fragments have been found to be innocuous Infections, including specific or nonspecific epididymitis, might cause obstruction, or orchitis from mumps, an atrophy Sterility seems unlikely in men who have had filariasis, scrub typhus, malaria, or prolonged atabrine prophylaxis

The evaluation of fertility is important and demands a complete study of the patient, physically and mentally. The man frequently is the cause in a barren marriage and his evaluation simple, although fertility of both partners is essential. Therapy must be based on both general and local factors. Vitamins are important, but hormone medication is of doubtful value except in endocrine dyscrasias. Vasoepididial anastamosis is helpful in obstructive cases.

Dr Humphreys, in this excellent review of the problem, states there is much that we do not know. It may be that in many cases there is a deficiency factor, and if we know what it is, the deficiency may be supplied. But there may be changes in the germinal epithelium itself which are irreversible. This constitutes a challenge to find out what causes bring about such changes and what underlying environmental factors may contribute to this state.

It is evident that a condition of sterility must be approached with understanding of the facts, that both partners, not only one of them, must be studied if we hope to avoid a barren marriage The practitioner may be most helpful in these situations, becoming thoroughly acquainted with a problem may disclose that marital adjustments must need be taken into consideration may be mental as well as physical, and sound advice may be needed rather than medicaments or more radical procedures cause of an individual state of infertility necessarily should be ascertained may not always be a simple procedure, yet we know a great deal more of possible means of relief than was formerly the case The point is to apply our knowledge with discretion.

Current Editorial Comment

Educational Indigestion Some of our readers may have suspected that we were much concerned with the prevalence of mental indigestion in the United States of We have remarked repeatedly the disinclination of employers to take candidates for any kind of position unless they bore a proper label affixed by someone else You can't become a college professor unless you are a Ph D You can't be a Ph D unless you are an AM You can't be an A M unless you are an A B In the army they call this "advancing through the grades" Seemingly, you not only get degrees, but you also brag about them Well, perhaps not exactly brag, but—you know you look down your nose at those who do not have them This is a fact our returned veteran comrades are finding out

It is a curious thing that the United States, a pioneer country, comparatively speaking, should thus become so dependent In a pioneer country a man was frequently judged by what he said he could do So, formerly in a western frontier town, with or without a college degree, it was thought madvisable, for example, to say you were a good shot unless you were. Otherwise, the already proved best shot in town might feel moved to try conclusions with you

Miss Gretta Palmer, in a most informative article, takes up the question of the difficulty sick people have in getting nurses to take care of them ¹ There are plenty of trained nurses The only trouble with them

¹ Pennsylvania M J June 1947

¹ Palmer Gretta What Happens When Trained Nurses Won t Nurse the Sick? Ladies Home Journal 44 50 (Dec.) 1947

is that they don't want to take care of sick people. And we don't much blame them The heads of your school of nursing insist that you have a college degree before you can even become a probationer in a hospital, and that while you are learning to make beds, take temperatures, make patients comfortable, you are whisked from the bedside to attend lecture courses in "physiology, anatomy, microbiology, materia medica, pathology, obstetrics, sociology, pediatrics, chemistry, psychiatry, diet therapy, and a half dozen other academic subjects"

That is what is meant by educating people out of their vocation. Fancy a young girl, a college graduate before she even started her three years' training course, a twenty five-year-old, scientifically trained intelligent acman, being asked on her way back from such a didatic, abstruse course, to stop and rub the back of a sixteen year-old primipara

expecting her first baby!

Florence Nightingale would not allow educational qualifications for her nurses She felt that either you were possessed of, or by, the qualifications that made you a successful nurse or you were not We suppose she felt herself to have intuition, or some such obsolete and unscientific quality. If we ever had to have a bad case of typhoid lever on a desert island, we should elect to have a nurse selected by Miss Nightingale rather than a college graduate primed with the latest nuances of microbiology.

It is not understood how higher education sneaked in and undermined the community judgment that once sized up a man by his ability to perform. But it has It is not known how it has destroyed the simple ambitions of the young men and women who used to aspire to careers in medicine and nursing just because they felt they had a vocation for them But it has Grievous are the results that higher education has already accomplished

The United States is infested, we had almost said is "lousy," with highly educated people who want to do everything except what they were educated to do In our darker moments we are not even sure that their educators know what they were educating them for

We have baby specialists coming out after five years in the Army possessed with the idea of blossoming forth suddenly as general surgeons. Doubtless they feel that those five years have matured both them and their patients too much to enable them to

follow their original vocation. Some holders of perfectly useful M D degrees are content to immure themselves in laboratories and spend much of their lives milking mice. Every qualified general surgeon comes out of the Army hell bent on becoming a specialist, certified by a Specialty Board, so that he can make money fast. Who can blame a man who has given five of his most productive and formative years to the service of his country for wanting to make money, but how many years is it going to take him to do it in that particular way?

Many years ago one of our leading universities started its course in Freshman English with the question "Who I am and why I came to " Many of the aspiring freshmen had great difficulty in answering either half of the question. It was a good question, but we think the students would have been better off had it been asked of them before they over reached the classic

shades of the university

We suggest that the question be revived and that it be asked of the prospective students. Then let it be asked also, and this is far more important, of the educators, "Who am I trying to educate? And what for?"

First Aid Is the present plan of teaching first aid in our public school system all that it might be? With the increasing trend toward higher accident rates in the home, on the farm, on the highways, the importance of a thorough knowledge of and training in first aid increases

It is our understanding that originally the New York State Health Syllabus of the Department of Education included twenty hours of first aid instruction equivalent to the American Red Cross standard course Apparently, more recently, first aid credit for other related subjects, such as science, biology, and the like, has been allowed so that the amount of first aid taught has been negligible

A correspondent comments "even when the full first and course was taught, each teacher was allowed to interpret the maternal as he understood it, therefore there was no standardization, and, to say the least, every opportunity to give out incorrect information which later might prove harmful in application"

Many police departments, apparently, are now recognizing the importance of first aid instruction for their personnel, so that

immediate and proper care may be given

to highway and other casualties

On the other hand, although school superintendents and principals have been agreed on the merits of a standardized course for which Red Cross certificates would be issued on successful completion of instruction, many have felt that they could not rightfully insist on their health education teachers taking a Red Cross instructor's course for the purpose of certification.

This reluctance on the part of school superintendents and principals might well stem from the absence of a definite policy concerning such teaching in the State Department of Education in Albany Certainly if first aid is to be taught in our public school system it should be taught effectively. The fact that the original New York State Health Syllabus included twenty hours of first aid instruction equivalent to the American Red Cross standard course seems to indicate that effective teaching of this subject was contemplated, but seemingly has not been effectively accomplished

Physicians, like other citizen-taxpayers, have children in the public schools and have an interest in the quality of the instruction they receive. If first aid is to be taught, should there be more effective implementation of instruction? We should like to see the matter given consideration by the various agencies concerned in the interest of better, early care of the injured

The Doctor Shoulders More Responsibility When suicide becomes a complaint that affects the young as well as the old, infirm, insane, and hopelessly diseased, it is time that someone paused and took account of stock. No reader of the daily papers can deny that such a situation exists. One hundred years ago it would have been laid at the door of the clergy. The generation would have been spoken of as one that had "lost faith"

The more the medical profession talks about psychosomatic medicine the more it will be called upon to shoulder its share of the blame for early suicides—those who can't or won't give time a chance to solve their difficulties. They will say "Why should I go to a doctor? He will spend an hour giving me a physical examination complete with blood tests and then tell me there is nothing the matter with me"

They will often be right, too There are too many doctors who ignore the fact that, for example, high speed transportation com-

prises two factors the automobile and its The machine may be perfect, but the driver crazy or "accident-prone" The conscientious doctor who tries to practice psychosomatic medicine may lose some important patients who are perfectly willing. even anxious, to admit to a physical disability and who flounce indignantly from his office when he insinuates that their troubles he, to continue the simile, not in the machine, but in its driver These patients will henceforth go about blasting the reputation of the honest doctor and end enthusiastically in the hands of the half-baked psychoanalyst or side-street psychiatrist, the walls of whose office are plastered with imposing looking parchment degrees from such institutions as the College of Universal Truth, or some dubious physiotherapy institute

Our older readers will wag their heads and say, "Our grandparents were never like that"

And they will be right The Atomic Age is a fearful age to live in If the human being has become so intelligent and scientific that he is in danger of blasting to pieces the planet upon which he lives, we can't blame any distracted person for choosing to end it all now of his own volition, rather than await his doom at the hand of some invisible, unknown, and incomprehensible enemy

The truth seems to be that man's intelligence is getting too big for its breeches. In 1870, let us say, children were born in large numbers. Their death rate was appalling. They were "raised naturally." But those who survived were "tough babies." We use

the term advisedly

Since then we have lowered the death rate almost beyond belief. In addition, we now consider the psyche of the child. One generation has not time to grow up before another system of child psychology is being tried upon its younger sibling. Small wonder that there is jealousy and contrasting behavior between brothers and sisters, and anxiety and confusion on the part of their parents.

We invite aspirants to the degree of Doctor of Medicine, and indeed, those who have already attained it, to return to the middle of the road. If they can learn not necessarily to practice psychosomatic medicine, but to recognize that every patient who comes to them is at once the car and its driver, and to treat both at the same time, they will earn for themselves a private and public appreciation that can never be measured or approached by academic degrees or financial remuneration.

TREATMENT OF POLIOMYELITIS IN THE ACUTE AND CONVALESCENT STAGES

Physical Therapy and Orthopedic Consideration

ARNO DAVID GUREWITSCH, M.D., New York City Halford Hallock, M.D. New York City, and Roder J. Dugan, M.D., West Haverstraw, New York

(From the New 1 ork State Reconstruction Home)

A LTHOUGH the return of muscle power in poliomyelitis depends upon the number of anterior horn cells that have been involved and the extent to which they have been damaged recovery can be facilitated and the effects of the disease mitigated by appropriate treatment in the acute and convalescent stages.

This discussion of therapy is based on the study of and experience with 552 paralytic partients in the acute and early convalescent stages who were treated from 1942 through 1946 at the New York State Reconstruction Home at West Haverstraw, New York. Until 1945 the patients admitted were under twenty-one years of age Since that time adults also have been admitted

The following treatment aims can be stated (1) to alleviate muscle pain, muscle shortening, and limited ffexibility, (2) to develop optimal function of the weakened muscles, (3) to re-babilitate the patient and make him as useful and independent as possible in the face of his handicap, and (4) to prevent the development of deformity in all stages of the disease.

Physical Therapy

Meat.—Pain is present in nearly every patient. We distinguish between spontaneous pain pain that is elicited when muscles are pressed or gently squeezed, and pain which is present on joint notion.

Spontaneous pain is brought about by posterior hori cell irritation and the pull on painful muscle fibers created by certain positions. Elimination of such pull can be accomplished by positioning the patient or by measures of support, for example, in the supine position a small pullow placed under the patient a shoulders will eliminate a painful pull of gravity exerted by the shoulders on the pectoral muscles.

on the pectoral muscles.

Promatal at the 141st Annual Meeting of the Medical Secrety of the and of New York, Buffal Section on Orthopedis Surgery May 8, 1947.

Pain on squeezing and on joint motion is best treated with most heat. We have been using hot packs extensively Since 1943, our method of choice has been daily baths at a temperature of 104 F for fifteen or twenty minutes repeated three to five times daily depending on the severity of symptoms (Fig. 1) Both packs and warm water are only partially effective. They are cumbersome and far from ideal but in the absence of anything better they represent the best method at present of reducing stiffness and freeing the patient from pain. It is our impression that the baths are more successful than the packs and less unpleasant for the patients. They also have the advantage of not requiring careful localizing of areas of pain and limited flexibility and can be given by any attendant, without knowing the rather intricate technic of hot packs

No exercises are given while the patient is in the bath Passive exercises to all joints are started from admission. With gradually subsiding pain the vigor of the passive motion is in creased and gradually, more and more firm stretching is applied to any joints that are stiff. The amount of existing pain and the status of joint flexibility are recorded at intervals on a special form using standard positions (Fig. 2). The baths or packs are continued as long as stiffness and muscle pain persist and as long as there is a favorable response. With improvement the number of daily packs or baths may be diminished gradually

In a number of instances we have found dry heat in the form of radiant light or short wave to be fully as effective as moist heat especially when the pain or muscle stiffness was localized to a relatively small area.

Exercise —Voluntary control of normal muscles can be educated to much greater efficiency, for example in the development of skills or in learning to play a musical instrument. In

Fig 1 Large swimming pool converted for hot bath routine. Note the head rests, which keep hair and ears dry and prevent the patient from slipping. Note also how carefully patient is being taken in and out of water.

diseases of the central nervous system voluntary control may be diminished or often confused A generally known example is a hemiplegic, who is apt to throw impulses simultaneously into the flexors and extensors of a joint. In infantile paralysis also we frequently see a lack of control in the use of individual muscles. Therefore, the first goal of muscle re-education in poliomyelitis is the restoration of exact control of individual muscles.

The second aim of muscle re-education is the development of maximal power in the remaining functional muscle fibers. By training, a vast reserve of function in muscles can be brought out if systematically increased effort is asked of the muscle fibers. This principle, which is true for

Fig 2 Record of flexibility and pain

healthy muscles, holds also for those in which a certain percentage of nerve and corresponding muscle fibers have been destroyed

Muscle re-education should be graded carefully, and care should be taken to avoid exhausting a weak muscle If possible, muscle training should be repeated several times a day daily performance of a muscle is the only guide to the optimal amount of effort to which it should be subjected A frequently repeated muscle test, employing the Lovett method of grading, provides a record of progress made. It helps to determine when and to what extent the patient is ready for increased effort (Fig. 3) Individual muscles are exercised for increase of strength as long as the record shows evidence of increasing power If there has been no return of power, we may give up hope in four to six If muscles are improving, we may conmonths tinue exercises up to two years

Special attention is given to the training of the respiratory muscles, which are frequently affected, and to well coordinated breathing

Walking—Since ambulation may represent a source of undue fatigue to weakened muscles, more or less extensively involved patients are started walking very gradually under water At first, they are placed on their feet in warm water up to the neck. This eliminates gravity and stimulates a multitude of postural reflexes without fatiguing muscles by weight bearing. By gradually reducing the level of the water, the amount of weight bearing is graded. If brace

Fig 3 One page of muscle chart

Fig 4. Walking under water

support for the weakened limbs is needed, the same type of brace that will eventually be used is employed in giving the preliminary under water instructions in walking (Fig 4). As facility increases the patients and gradually allowed to walk on land under supervision and finally, at will in the ward and out of doors.

Ambulation is allowed as soon as it is felt that the upright posture and the effort of walking will not affect recovering muscles unfavorably Braces should be provided when necessary for support or to prevent the development of deformity Preparatory exercises for balance and walking, including development of arm muscles if crutches will be needed are started long before the time for actual walking

Rehabilitation

As soon as no further improvement of strength in individual muscles can be reasonably expected -we take a standstill of three months as a guide—an attempt is made to fe-train as much useful function as possible. A wide range of reserve function is available and can be drawn upon to substitute for loss of muscles under water and awimning are useful aids to training substitution by other muscles, balance and coordinated movement. When the process of degeneration of the affected muscle fibers has reached its end, the fatigue element in handling muscles can be disregarded and training for useful function can be started The end point of the process of degeneration is ascertained clinically by the absence of quick fatigue when the muscle is exercised or more exactly by chronaue read ings

Again, we establish first a record for existing function, using a purely practical approach. The patient then is taught to perform necessary daily activities, such as getting out of bed into a wheel chair, dressing putting on braces, bath room necessities getting up and down stairs or curbs and getting in and out of buses.

There are few patients who cannot be improved by a methodical attempt to improve useful function. We have trained several patients with complete or extensive paralysis of the arms to perform almost all daily activities, like enting weshing dressing with special garments writing by using their feet entirely (Fig 5). Functional occupational therapy, given for the double purpose of recreation and of training of muscles and skills, is used extensively in this phase.

Psychologic Aspects

The importance which we attach to the psychologic aspects of infantale paralyses is emphasized in the setting aside of funds at the Home for study and treatment of the mental phases in the care of the patient. The psychologic impact of the disease with its paralytic and disabling effects is enormous. In the past this has not been given the study and attention that it should have had Recovery rehabilita

Fig. 5 Patient with fiall upper extremities.

tion, vocational training, and, in the adult, job re-training, will be facilitated greatly by a healthy psychologic readjustment

Deformities

Deformities can develop during any stage of the disease. They interfere with rehabilitation, and the ultimate degree of function of the individual depends upon the absence of deformities as well as on the return and development of muscle power. The prevention of deformity, therefore, cannot be overemphasized.

In the early stages deformities are produced by muscle shortening associated with muscle irritability and pain, by habitual faulty attitudes while in bed, and by muscle imbalance, the result of paralysis. They are prevented by the previously described measures of alleviating muscle pain, by not allowing joints to remain for any length of time in faulty positions, and by opposing with mechanical means the deforming pull of imbalanced muscles

Proper position in bed is important. The patient most of the time should be kept in a supine or prone position on a firm mattress with the arms at the side. Pillows or rolled towels should be used to prevent external rotation of the legs, and a cradle should be employed to prevent the weight of the bed clothes from pressing down the feet into equinus. Footboards are used to control foot drop. Variations of this position may be necessary in the early stage to relax a group of muscles that may be in marked spasmodic contraction. If imbalance is present between the

Fig 6 Neglected hip deflexion deformity

flexor and extensor muscles of the hip or if there is marked weakness of the anterior abdominal muscles, prolonged sitting up in bed should be avoided because of the increased danger of developing a hip flexion deformity (Fig 6) Prolonged resting of the hands on the chest or abdomen also should not be allowed, as in this position the wrists are flexed and, if muscle imbalance is present, flexion deformities may occur

Molded plaster of paris splints or bivalved casts are the best means of supporting joints while the patient is in bed to prevent deformity when this is necessary. When he is ready to get up, braces made of steel or duraluminum are employed for the same reason, and in severely paralyzed cases are used to provide stability so that the individual can walk. These must be worn as long as there is any tendency for deformity to develop or until this possibility, or the joint weakness, has been eliminated by reconstructive and stabilizing surgery in the residual stage.

The development of deformity should not be awaited, rather, it should be anticipated. It is far easier to prevent malposition than to correct it. If deformities occur or increase in spite of the early application of heat and stretching, they must be corrected by methods of traction, wedging, or turnbuckle casts.

Surgery

There should be little need for surgery in the convalescent stage, since deformity generally can be controlled by treatment and the appropriate use of splints and braces. If, however, deformities develop and will not yield to conservative means of therapy, surgical correction will be necessary. In the residual stage, surgery of a reconstructive and stabilizing nature plays a major role.

Statistics

Three hundred consecutive cases have been studied for development of deformities and for behavior of muscle strength of a few muscles

TABLE 1 -- DEFORMITIES

				====
	Mild	Moderate	Severe	Total
Scoliosis	40	16	1	57
Hip flexion	16	7	Ö	29
Recurvatum	10	5	1	16
Knee flexion	4	1		
Equinua	85	16	1	$\frac{102}{21}$
Cavus foot	18	3		21

We called deformities mild when no surgery was contemplated, in moderate deformities surgery was likely, and in the group of the severe deformities surgery had been decided upon

Table 2 demonstrates the average improvement of five muscles between the first and last examination We have used both symbols, letters, and figures The key for our evaluation is seen in Table 3

TABLE 2 .-- MUSCLE STRENGTH

	Number of Muscles	Early Strength	Late Strength	Differ
Auterior tibial Cali	303 382	3 17 P 3 50 P+	5 18 F-	2 1 6
Quadricepe Abdominals	40I 414	4 26 P+ 3 68 P+	6 60 F+	2 34 3 25
Deltoid	277	4 27 P.T	6 89 1 +	2 62

These figures are given without comment. The symptoms of infantile paralysis vary widely only much larger groups of patients can form the besis for valid conclusions. It is noteworthy however that the abdominals are the most frequently involved muscles, and that they show a better rate of improvement than the other muscles of the group. The anterior tibuli shows the least improvement of all muscles, which confirms the clinical impression we had. The del told, the only muscle of the upper extremity we followed, has been involved distinctly less frequently than the muscles of the lower extremities.

Summary

- 1 A discussion of the physical therapy and orthopedic management in the acute and con valescent stages of poliomyelitis has been presented.
- 2 This was based upon the study of and experience with 552 paralytic patients who were treated from 1942 through 1946 at the New York State Reconstruction Home, West Haver straw, New York.

Discussion

H J Behrend M.D., New 1 ork City — The treatment of poliomyelitis has become a serious probem for the hospitals and for the physicians. Because of the widespread publicity given to this disease, parents and relatives will frequently demand the application of certain methods of treatment for their patients.

The approach to treatment presented here follows threlly the lines of modern physical medicine including reliabilitation and orthopedies. In so doing the authors have clearly come to the conclusion, which coincides with our own, that the nature of the disease makes it impossible to follow the strict commandments of an individual method We agree that the conventional applications of most heat namely het packs and hot baths, are cumber

some and far from ideal. We have used hot baths only occasionally and then not more than once a day. It would interest me to learn the effect of baths of 104 F given for fifteen to twenty minutes and repeated 3 to 5 times daily on the circulation and on other systems of the body. In my opinion a bath of this temperature given so frequently constitutes a mild form of fever thrapy with all its possible complications and weakening effects.

Because we realized all the difficulties with which we were confronted in applying hot packs regularly over a long period of time we have also been look ing for different methods to releave muscle pain

In 1944 I published a report on the pain relieving effect of hydrogalvanism the galvanic bath in subacute pollomyellits. We have used this method ever since at the Hospital for John Diseases in Now York with satisfactory results. The theory of the physiologic effect of this method is based on the accepted physiology of the continuous galvanic current in combination with hydrotherapy. The method has been described in the Bulletin of the Hospital for Joint Diseases, October 1944

The problem of rehabilitation received consider able attention during the last world war. Much has been done in this respect for the injured the paraplegies and the homiplegies Very little has been done in this respect for the victims of polionyelits. The authors have realized the importance of this problem. The teaching of daily activities using the practical approach of vocational training and job training, has been more than neglected in the past. The authors are to be congratulated for their approach to the problem and for their fine presentation.

R. D Severance M.D., Syrucuse New 1 ork—I was interested in the eareful, continuous recording of the various symptoms especially pain stiffness muscle weakness and level of practical function. We too have given hot baths. I would be interested in the experience Dr. Gurewitsch had with the general systemic reactions of the patients to the warm water. We have developed as a guide for determining the end point of tolerance of each bath the appearance of pearls of sweat on the patients is forcheed. We have found that a warm bath acts as the best sedative for pain and discomfort making any medication unnecessary.

If muscles remain completely paralyzed for a few months we have given up treating them every day The muscles are checked by the head physical ther apist once a month for signs of returning power I wonder if Dr Gurewitsch thinks this practice to be adequate.

I believe it is a very good idea to start the stand ing and walking of patients under water climinating entirely the effort of weight bearing. We have found however, that the reastance of the water may interfore quife considerably. I would be interested in the criteria developed for evaluating the limit of fatigue in relation to the amount of effort to which the muscles should be exposed.

Dr Gurewitsch When I went out to Minneapolis to study Sister Kenny's work in 1943 I asked whether she could suggest a use for the three pools which we happened to have at our disposal at the Reconstruction Home in the treatment of polio "The best use I could make of the pools was to fill them with good garden earth and to plant beautiful flowers in them for the patients to enjoy," was the answer I received I am afraid we have not followed this advice

We have watched for systemic reactions care-The patients do develop some degree of fully fever Blonde, light-skinned patients may go up to 100 5 F, or even 101 F Dark-skinned or colored patients show less temperature rise. Since fever therapy has been advocated as a means of getting rid of pain and stiffness, this reaction may not be We give salt tablets, watch for replacement of lost fluid, and check the patient's appetite and weight

In very debilitated patients we have cut the time of immersion down to five minutes once or twice But on the whole we have found that the great majority of patients could withstand the routine described

The temperature of 104 F was chosen arbitrarily We have continued one routine for the entire series in order to get an impression from a large group of patients The coming year we will start, equally arbitrarily, another group treated with a temperature of only 101 F, and in due time we may be able to make a comparison

Sedatives were mentioned. I would like to utter a word of caution Sedatives are dangerous wherever there is respiratory distress We have seen patients become restless, fighting against falling asleep, because the lowered respiratory capacity during sleep got too close to their minimum requirements A further diminishing of the respiration by sedatives may, in severe cases, kill the patient in his

We treated zero muscles differently from zero ex-The prognosis of a zero muscle surrounded by functioning muscles is unpredictable It should receive more intensive muscle reduction than outlined by Dr Severance If the entire extremity is paralyzed, the prognosis is much more definite to the negative, and a speedy attempt, aiming at practical functional education of the patient, is justified

We have not found the resistance of the water for early walking exercises to be an important factor The movements are executed very slowly with attention put mostly on good coordination

Muscles which are still in the process of degeneration or regeneration show signs of fatigue very quickly, in this stage they should not be exhausted by nonsupervised activities like walking. If the exercise is stopped immediately when signs of exhaustion develop, demonstrated by decreasing function, renewed effort within only a few minutes is possible and desirable Treatment sessions, therefore, should be repeated several times daily and the patient, if old enough, should be instructed as much as possible to exercise the weak muscles by The time and type of his exercises should himself be checked daily by the therapist

If we see no improvement of strength after three months, we feel that the approach should be changed We have chosen three months arbitrarily

As to the testing of abdominal muscle strength, we have not been very fussy We have tested muscle groups rather than individual muscles by simple anterior and lateral flexion of head, trunk, and thighs

ANNOUNCE RADIO PROGRAM, "DOCTORS TODAY"

The A.M A.-N B C radio program "Doctors Today," which opened December 13, 1947, is scheduled to run for 26 consecutive weeks at 3 P M each Saturday, Central Standard time. The exact number of stations taking the program will be announced when available, the 1947 series, "Doctors-Then and Now," was broadcast by approximately 140 stations from coast to coast

"Doctors Today" is a program based on timeliness and therefore subject to change The following

schedule is tentative

Whenever possible programs cancelled in favor of more timely ones will be broadcast later in the

THE EFFECT OF DRILLING THE NECK OF THE FEMUR IN LEGG PERTHES' DISEASE

Isadore Zadek, MD, New York City, and Geoege DB Berkett, MD, New Orleans (From the Hospital for Joint Diseases)

THIS is an analysis of the end result of drilling through the epiphyseal cartilage of the neck of the femur in 10 patients suffering from Legg-Perthes' disease. This work was done in 1942, but its presentation was delayed because of more pressing activities incidental to the recent war

All of the patients were young boys time of operation the youngest patient was five and the oldest, ten years of age. The average age was seven years. Seven of these drillings were performed from within after dislocating the head of the femur from the acetabulum, and three from without, the channels being made through the neck of the femur in the same manner as one performs a blind nailing for fracture of the neck of the femur In order to facilitate this type of drilling, a window was cut in the lateral aspect of the femoral shaft just below the greater trochanter This procedure is not advised for so-called "blind nailing" of the fractured hips as the nail loses an important point of fixation. The window was replaced and countersunk with a bone set after the drill holes were made into the neck of the femur

There is so much more trauma associated with intra-articular drilling and interference with the local blood supply to the head and neck of the femur that this is less desirable than extra-articular drilling. With the former type the articular cartilage of the head of the femur is necessarily traumatized.

In 6 patients the right hip was involved and 4 had the condition on the left. The longest time that elapsed after operation was a check-up twelve years later. The shortest period for check-up was two years

The disease had existed for an average of ten to twelve months prior to drilling. Several cases were excluded for reasons such as insufficient drill holes, lack of conclusive evidence that the criphyseal cartilage had been traversed, or too short a period of observation after operation.

All of the operative incisions healed by primary umon and the only complication was a fracture of the upper third of the shaft of the femur that occurred in one case when the head of the femur was being dislocated from the acctribulum

All of the patients had some protection after operation including bed rest with traction They

remained in bed for about six months postoperatively, although some were kept there for a much longer period of time and were protected, more or less efficiently, for eighteen months to four years Subsequent protection was carried out by plaster of Pans spicas, crutches with a high shoe on the opposite side, or a caliper brace. The caliper brace does not remove the superincumbent weight to any appreciable degree and merely serves to lesson the individual's activity.

Six of the 10 patients had a limp at the time of the final examination Five patients were positive for Trendelenburg a sign, 5 were negative Two of them lacked 5 degrees of full extension while one of them lacked 35 degrees of complete flexion Five patients lacked abduction of 5 to 15 degrees Two cases had no shortening as measured from the anterior superior spine of the ilium to the internal malleolus. The remaining cases had shortening that varied from 1/2 inch to 1 inch and averaged 1/4 of an inch One patient showed atrophy of the thigh of 2 inches and in the others, it varied to as little as 1/4 of an inch In all of these cases but one, in which the epiphy seal line completely disappeared, the epiphyscal cartilage was still evident roentgenographically three to twelve years postoperatively

The patient in whom drilling apparently provoked fusion of the epiphyseal line was ten years old at the time of operation with the check-up x ray examination made four years postoperatively. This drilling was done intra-articularly, they in the end result being a flattened head of the femur. In one case in which the drilling was done extra-articularly at the age of ten the head of the femur was round and globular, and the epiphyseal line was still evident three years postoperatively. There was no shortening at the time of the check-up. The head of the femur in the remaining nine had become flattened and mushroomed to a more or less marked degree.

One of the cases was of particular interest. The disease was bilateral The left side was drilled extra-articularly. The patient remained in bed at our convalescent home for two years with skin traction to both lower extremities. At the end of the two years the side operated upon showed more flattening of the head of the femur than the one not operated upon while the neck of the femur was broader and shorter on the side operated upon

Presented at the 141st Annual Meeting of the Medical Sotiety of the State of New York Buffalo Section on Orthopodic Surgery M y 9 1947

Comment

This series of cases is too small to allow one to draw absolute conclusions

Assuming that the condition is a manifestation of aseptic necrosis with a local vascular disturbance, one might have expected that drilling through the defective area would have assisted in the process of resolution Our examination has not shown this to be true One would, therefore, conclude that the progress in the healing of this disease is not influenced by the drilling

Probably Legg's opinion is correct, i.e., that there are two distinct types of the disease, one in which the head becomes flattened and mushroomed centrally, and the other in which there is a tendency toward flattening associated with more fragmentation and migration of the flattened head toward the greater trochanter ¹ Legg felt that the ultimate result depended upon what type we happened to be dealing with, that the outcome was pretty well predestined, and that the change of shape was not influenced by weight-Notwithstanding this, it seems logical to avoid weight-bearing during the active period when softening is present, as has been recommended by Danforth and others ²

In contrast to the above, drilling through the epiphyseal cartilage does hasten its closure in slipping of the upper femoral epiphysis and in congenital coxa vara 3 It is not readily apparent why this does not occur in Legg-Perthes' disease

We wish to thank Dr S Kleinberg and Dr H Sonnenschein for the privilege of studying cases from their services

Discussion

Joseph Buchman, M.D., New York City-Dr Zadek is to be commended for his frank report on two operative approaches for the cure of Perthes' The drilling of the head and neck of the femur, whether it be via the extra-articular or the intra-articular route, has failed to modify the course of the disease My own experiences were concerned with the drilling of the head and neck from the articular surface of the head subsequent to its dislocation from the acetabulum in 12 instances none of these instances was the evolution of the disease modified to any appreciable degree either for the better or the worse

Dr Zadek rightly calls attention to the oftrepeated observation that drilling in congenital coxa vara and in slipped femoral epiphysis hastens the cycles of these disturbances by the production of early bony union between the head and neck of the femur In Legg-Perthes' disease drilling, no matter how thorough, is without effect planation for the difference in the behavior of the latter disturbance in contrast to the former disturbances may possibly be due to the fact that in Legg-Perthes' disease the area of aseptic necrosis is much more extensive and therefore is not so readily resolved by creeping substitutions as in the congenital cova vara and slipped femoral epiphysis A second explanation may rest in the fact that the area of aseptic necrosis in Legg-Perthes' disease is at the end of the bone and, consequently, presents less opportunity for revascularization than in congenital coxa vara and slipped femoral epiphysis where the disturbance lies between the head and the neck. Both of these consist of relatively normal bone with normal circulation and are, therefore, capable of acting as foci from which creeping substitution may develop

It is perhaps opportune at this time to describe the gross pathologic appearances, noted subsequent to the dislocation of the femoral head in Legg-Perthes' disease In every instance that I have observed the head was of relatively normal shape The overlying cartilage was at times discolored and presented a loss of its usual sheen. There were areas of softening deep to the articular cartilage and loss of attachment to the underlying bone to the extent that if sufficient care were not exercised during the drilling operation the cartilage could readily be pecled off the head much like the cracked shell of a hard-boiled egg The texture of the head, as demonstrated by its resistance to the drill point, was irregularly soft and hard at varying levels In several instances a wedge-shaped section was removed from the inferior aspect of the head These sections presented avascular, necrotic bone The area of juncture of the perichondrium of the neck and the articular cartilage usually presented a velvety cuff of edematous and congested synovial The ligamentum teres was usually thickened, edematous, and congested, and presented a similar appearance to that noted at the periphery of the head Section of the ligamentum teres did not produce any significant hemorrhage and in no instance was it necessary to tie off the contained vessels The point of attachment of the ligamentum teres to the head and its origin in the floor of the acetabulum was usually surrounded by the abovedescribed velvety-appearing edematous and congested synovial tissue

I mention these pathologic appearances to indicate the possible dangers inherent in drilling of the head and neck of the femur in Legg-Perthes' disease It is very possible that on drilling from the greater trochanteric region small fragments of articular cartilage may be torn off and dropped into the joint, with resultant development of cartilaginous bodies within the articulation

Dr Zadek's presentation is important, even though it does not speak of success. Actually it points to procedures which should be shunned. Avoidance of weight-bearing by prolonged bed rest, several years if necessary, yields the most satisfactory results

PERIARTERITIS NODOSA LIKE LESIONS IN TUBERCULOUS MENINGITIS

MILTON G BOHROD M D, Rochester, New York

(From the Pathology Laboratories of the Rochester General Hospital)

CTUDIES of the past few years in the patho-O genesis of periarteritis nodosa stimulated especially by the researches of Rich and his coworkers, have pointed to the importance of allergy as a mechanism concerned 1 According to this conception, penarteritis nodosa is the result of an anaphylactoid antigen-antibody reaction in which the arteries are the site (the so-called 'shock-organ') of the reaction The experi mental production of penartentis by methods which do not involve such reactions should warn one against accepting this mechanism as the only possible one. However, if periartentia nodosa cannot at this time be said to be the nathognomonic sign of vascular allergic reaction it can nevertheless be accepted as highly characteristic.

In experimental periartentis nodosa a very limited number of antigens have been employed. In the human disease it is rare to be able to designate the actual substance which is involved. The question remains unsettled therefore as to how wide a range of allergens is capable of electing the characteristic response. This in turn has a bearing on the whole question of the causative agents responsible for many allergic vascular, cardiac joint, and other diseases.

Case Report

Case 1—The patient was a twenty-six year-old colored man who entered the Rochester General Reputation July 12 in a stuprous state. The history obtained from his relatives was fragmentary and not too reliable. The patient had contracted a cold in February and since then had had a dull pain in the chest. Since March he had been weak and in the past few months had lost 15 pounds. Two weeks before admission he developed severe headache and lethargy and for some hours he had been semi stuprous.

Examination showed definite signs of meninguits. The spinal fluid, obtained at an initial pressure of 75 mm., was slightly cloudy and on standing developed a pellicle. There were 500 cells per cu mm. 75 per cent lymphocytes and 25 per cent neutrophils. Sagar 19 mg. per 100 cc., chlorides 460 and total protein 184 mg. per 100 cc. On subsequent spinal fluid examinations over a period of three days there was little change except that the pressure rose as high as 405 mm. No micro-organisms were seen in smears, but guinea pigs inoculated with two different fluids developed tuberculous lesions from which tubercle bacilli were recovered.

Presented at the 141st Annual Meeting of the Medical Fociety of the State of New York, B ff lo, Feethen on Pathology and Chinical Pathology May 7, 1947

The patient's condition became rapidly worse He died on July 17 his sixth hospital day

Necropsy revealed evidence of tuberculosis in the lungs hilar lymph nodes, prostate, and the men inges. The lungs showed small feet of acnosenedese involvement, larger areas of caseous pneu monia, and disseminated miliary tubercles. Military tubercles were not noted grossly in the spleen or liver but they were found on histologic examination. Most of the prostate was replaced by caseous material.

The brain weighted 1,280 Gm. The base was covered by fairly thick gelatinous exudate, which extended over the cerebollum pons and modula. The region of the exit of the fourth ventricle was obstructed and both the fourth and the third ventricles were dilated. Over the convex surface the leptomenings were only slightly thickened and cloudy and along the course of the blood vessels a few pinhead-size gray nodules could be seen.

Except for the vascular lesions the histologic find ings were typical of the usual tuberculous meningitis. The exudate contained considerable fibrin and many cells partly lymphocytes and histocytes, partly neutrophil leukocytes. There was a marked tendency for the exudate to become necrotic, and around the necrotic areas the histocytes tended to congregate and form abortive tuberculoid granulomas. Only rarely was a well-defined tubercic en countered

Vascular lesions were very prominent at the base of the brain where grosely the exudate was thickest every meningual vessel of moderate size and some amall vessels were involved The largest vessels showed no involvement. In the rest of the brain those vessels were involved which were close to regions of inflammatory infiltration. For the most part the typical lesion was a panartentis, less frequently it was simply a periarteritis and a few vessels were seen which showed only an endartentis, or fibrancid necrosis of a portion of the wall. All of these lesions recombled those seen in typical cases of periarteritis nodosa. There was a tendence in a very few vessels for greater necrosis than is usually encountered in periartentis nodosa The pan arteritic lesions caused great thickening of the vessel which stood out prominently in the sections.

The necrotic and granulomatous lemons of the meninges showed moderate numbers of tuberclo bacilli in sections, but the most careful search in many sections failed to disclose a single tubercle bacillus in the vascular lesions

No periarteritic or other arterial lesion was found in any other organ in the body

Discussion

While tuberculous lesions in general avoid blood vessels this tendency is not as marked in

the meninges as elsewhere Frequently, the lesions of tuberculous meningitis follow the course of the blood vessels, and sometimes the vessels themselves are thickened and infiltrated with inflammatory cells The only unusual factors in the case described are the extent of the vascular involvement and the presence of so many stages of lesions frequently seen in penarteritis nodosa

The vascular lesions may be explained as the result of the action of tuberculoprotein on meningeal blood vessels which had been sensitized to this substance, and with the production of perarteritis nodosa-like lesions The apparent absence of tubercle bacilli in the vascular lesions may be of some importance in support of this That the meninges can be sensitized experimentally to other proteins was shown long ago 3 The lesions produced were not dissimilar to the ones shown in this case

This has a bearing on the pathogenesis of tuberculous meningitis in general No one will deny that the condition may follow the rupture of a large tuberculoma into the subarachnoid space But the pinhead-sized or slightly larger lesions, found after painful search, if at all, are more easily explained as the formation of granulomas after the occurrence of the meningitis, for this disease frequently has a duration of several weeks or months The necrotizing character of the lesions, the frequency of vascular lesions, and the sparsity, in many instances, of tubercle bacilli in comparison with the degree of exudation, all these point to sensitization of the meninges as an important factor in producing the meningitis

There remains the problem of the identity of the lesions with those of the disease called periarteritis nodosa This latter condition not only has certain characteristic histologic features, but there is also a characteristic distribution of the lesions among the organs and, usually, a proneness to dissemination, both of which are absent in this instance Yet, isolated organ involvement been reported in periarteritis nodosa Furthermore, in the absence of an identifiable living or chemical agent in the usual case of periarteritis nodosa, the only criteria for naming the lesions are morphologic ones, and these are identical histologically in the well-defined case and in the one here reported

It is evident that tuberculo-allergen is only in exceptional instances a cause of periarteritis The fact that it is capable of eliciting the reaction in sensitized vessels points to the probability that in the more common dissemmated disease a variety of allergens are probably responsible

Summary

A case of tuberculous meningitis is reported in which there were an unusual number of unusually well-defined vascular lesions, histologically identical with those seen in periarteritis nodosa The vascular lesions were, however, limited to the meninges

It is suggested that this represents an instance of the allergic nature of periarteritis nodosa lesions in which the allergen was tuberculoprotem and in which the meningeal blood vessels were hypersensitive to this allergen

CONGRESS ON MEDICAL EDUCATION AND LICENSURE TO MELT

Some of the most important problems facing medical schools at this time will be discussed at the 44th annual Congress on Medical Education and Licensure, to be held under the auspices of the Council on Medical Education and Hospitals and the Federation of State Medical Boards at the Palmer House, Chicago, February 9 and 10, 1948 Papers on the financial support of medical educa-

tion will provide a highly significant discussion. The addition to the undergraduate curriculum of courses on the clinical effects of nuclear fission and on physical medicine and rehabilitation will be discussed by authorities in these fields The recent intense interest in the subject of general medicine makes the review of programs for preparing students for general practice of particular significance

In addition to the formal program of the congress, several national groups concerned with medical education, research, hospitals, and licensure will hold special meetings

These include the Executive Council of the Association of American Medical Colleges, the Advisory Board for Medical Specialties, the National Board of Medical Evaminers, the National Society for Medical Research, and others -A M A News, December 26, 1947

CRITERIA OF HEALING IN FRACTURES FOLLOWING INTERNAL FIXATION

EDGAR M BICK, M D, New York City (From the Mt Sinas Hospital)

THE problem of bone healing must begin with L definitions. This may appear to be an elemen tary cliché at first glance, but in recent yours those of us who have had contact with large num bers of men treating fractures have found that no actual criteria of healing exist and that most of us have but a hazy notion of what we mean by the phrase T P Murray remarked on one aspect of this fact when he wrote Tigures collected by different surgeons with respect to the normal rate of union of any particular fracture are of comparatively little value because the standard varies so greatly as to what clinical and v ray evidence constitutes union ' However, before a standard can be set, it is necessary to define what constitutes bone healing Does it refer, as some maintain, to the complete restoration of trabecular continuity across the fracture line, or does it refer to gross continuity of the rigid structure of the bone, regardless of its histologic components? Is bone union an anatomic phenom enon or a functional one? Obviously, the answer can be the affirmative in either form and must by the nature of the question be an arbi trary decision. This is not at all an academic question The two possible answers represent a serious discrepancy in time, which is of consi er able practical importance to the patient and to those responsible for his medical care

The process of healing in fractures is in its broader sensa, a problem of phases. There are a number of phases in the tissue reactions of reparative esteogenesis. Two of them are pertinent here. One is the phase of effective healing, that phase of reparative osteogenesis in which the resistance of healing bone to stress and strain is sufficient to permit renewal of its normal functions within reasonable limits. In fractures of the long bones of the upper extremity this means manual work short of severe pressure or torsion in the lower extremity it means ordinary unassisted weight bearing.

The second phase pertinent to the present problem is that of replacement, the phase of reparative osteogenesis during which the dense, fibrous fibrocartilaginous tusue of the internal or definitive callus is replaced by normally constructed bone trabeculae. This occurs concurrently with but much slower than the development of the uniting external callus which is the chief factor in the previously defined phase. Effective bone healing should be the primary concern of the surgeon, replacement in definitive callus is secondary and is for the most part the concern of the osteologist

That effective bone healing occurs in many cases long before the x ray film gives evidence of completion of replacement by definitive callus has become increasingly evident with the experience of recent years. Recognition of this fact has led to a significant reduction in the more or less arbitrary standards of morbidity-time in many types of fractures. This is particularly and strikingly true in fractures treated by internal fixation.

In a recently completed study of the structural patterns of callus following fractures of the long bones, it was found that the rather predictable rules which applied to healing fractures in general did not apply to those treated by methods of internal fixation 2 In fact, it was found that resumption of at least limited function was possible in uncomplicated cases, following rigid internal fixation, long before x-ray films showed any of the accepted criteria of bone healing. The absence or minimal quantity of demonstrable external callus was repeatedly noted in all uncomplicated cases treated by efficiently applied bone Fracture lines remained visible on x ray films long after the patient was actually ambula As early as 1942 Burns and Young reported fractures of the tibla and fibula, treated by internal fixation with plates and no external fixation and that patients were "walking at four weeks 'and 'you get early union with the quickest restoration of function " Such observations have appeared repeatedly during the past few years chiefly from military and naval installa tions publicising the impression gained by many of us who had the opportunities to observe such cases although "four weeks' was somewhat earlier than most allowed for fractures of the tibia.

The esteology behind these observations is important for without an understanding of the process of reparative esteogenesis clinical interpretation may become too facile. James Paget in England and Dupuytren in France recognized the different functions of the external or supportive callus and the internal or definitive callus over a hundred years ago. In fact, Dupuytren is credited with having first employed the latter term. The importance of this distinction has been repeatedly emphasized but seldom appre-

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Orthopedic Surgery May 9, 1947

ciated 1 In efficiently plated fractures the bone plate takes over the function of external callus and permits resumption of function of the bone as soon as its strength, plus that of the consolidated fibrous fibrocartilaginous material of the internal callus, establishes effective healing This internal callus, before the replacement phase defined above is completed, is radiotranslucent and, therefore, appears on x-ray films as an area too often described as "atrophy," "no sign of union," or is occasionally misinterpreted as fracture fragments kept apart by the plate It cannot be emphasized too strongly that this intersurface area does not normally collapse during bone union. it is filled with the firm components of the so-called soft callus and is ossified eventually by replacement with bone cells and trabeculae

Because of these osteogenetic processes, a study of x-ray films offer no positive criteria of effective healing in fractures treated by internal fixation There are, however, important observations of a negative sort Atrophy of the cortex beneath the plate or atrophy about the screws inevitably indicates that these have become loose in a locally This may or may not be necrotic environment the result of infection In recent years, since the introduction of chemotherapy, it most often is not infection In either case it is a sign that the fixation is no longer efficient. The appearance of a considerable external callus is another danger It means that fixation has been madequate or that the fracture was held in poor alignment so that the artificial support of the plate was insufficient to take the place of an external ossific mass In either of these instances the time factor for return to unsupported activity cannot be gaged as efficient internal fixation could

Certain other usual criteria of effective healing in fractures are likewise not applicable to cases treated by internal fixation The method of auscultatory percussion introduced by Lippmann in 1932, which has proved a valuable means of gaging the progress of bone union, is not dependable in these cases 4 The transmission of sound waves through a dense medium upon which the test depends is complicated by the presence of the fixed rigid metal and varies with factors other than ossification Local tenderness, another classic symptom by which healing has been gaged ever since the days of Hippocrates, is likewise not a criterion of effective healing following internal fixation, since tissues over the metal or in its vicinity are apt to remain tender to pressure for a long time

What then are the positive criteria of effective healing in fractures following internal fixation? Until some method is devised in which resistance to stress and strain of a long bone can be mechani-

cally measured in situ without danger of refracture, no accurate determination is possible Since it has been shown that the usual clinical and x-ray criteria are not useful, the matter rests entirely upon the tenuous factors of personal judgment and experience at present Certain of the common fractures have now been observed in sufficient numbers by a wide enough variety of investigators to establish tentative arbitrary standards For example, fractures of the tibia and fibula, efficiently plated, and manifesting no contrary indications, may be permitted the test of guarded weight bearing in six weeks safely After one week of this, an x-ray picture should be In uncomplicated well-healed cases there will be no change in alignment. if further restriction is necessary because effective healing is not vet attained, a slight shift or angulation will be observed on the film Fractures of the humerus treated by internal fixation require no plaster immobilization and in uncomplicated cases may be allowed the test of guarded motion between the fifth and sixth week safely (It may not be long before further observation decreases this time factor by a week) We find that fractures of the shafts of the radius and ulna with either one or both bones plated require six weeks to cover a reasonable margin of safety. The thinness of the shafts in proportion to the length of the leverage upon which the pull of the intrinsic muscles is effected requires a firmer strength of union before activity can be resumed without fear of serious angulation than do fractures in which the apposed surfaces offer a larger area I am not prepared to suggest a time factor for fractures of the femurs as vet. since in these cases the enormous stresses and strains require considerable resistance at the fracture site Most cases of fractures of the shaft of the femur in which internal fixation was applied were complicated open fractures, often severely comminuted or with some loss of substance seldom that bone plates are used in simple fracture of the femur, so that further experience will be required to establish the expected duration of morbidity

The criteria of healing in fractures following internal fixation, then, are special and cannot be interpreted in terms of the criteria of healing in fractures treated by other methods At present, these are chiefly negative in character, that is, x-ray evidences of the absence of complications which indicate weakening of the fixation evidences are local atrophy about the metal or the appearance of significant amounts of external ossific callus A narrow strip of external callus along the plate or on the opposite surface, or a small knob at the fracture line in all that is permissible in normal healing. The only positive criterion is observation for perceptible change of alignment during a short period of guarded function. With these concepts in mind it is not impossible to entertain the hope that the time factor for return to restricted activity, at least, following internal fixation will, with further experience, continue to be reduced in the general civilus population 30 East 60th Street

NATIONAL CONFERENCE ON RURAL HEALTH IN CHICAGO FEBRUARY 6-7

Featuring the health problems of the rural child, the third annual National Conference on Rural Health will be held in Chicago Friday and Saturday February 6 and 7 1948 More than 500 delegates leaders in child health and welfare work throughout the country representatives of the farm groups and the medical profession and others interested in securing for every child a happy healthy futureare expected to attend

The conference will be sponsored by the Commit-tee on Rural Medical Service of the American Medical Association in cooperation with the American Academy of Pediatries and representative farm organizations. The A.M.A committee, headed by F. S. Crockett M. D. of Lafayette Indiana, is composed of 11 physicians.

More than 40 speakers are on the program for the two-day session Among the speakers on the open-ing morning will be George F Lull M.D. Chicago secretary and general manager of the A.M.A., who will deliver the addresss of welcome Lee Forest will deliver the address of welcome Lee Forest
Hill, M D Dea Moines Iowa, president of the
American Academy of Pediatries, who will discuss
bealth problems of the rural child and John P
Hubbard M D Washington, D C director of Child Health Studies of the American Academy of Pediatrics who will participate in a discussion of child health services.

On Friday afternoon four representatives from

the youth committees of the National Farmers Union, the American Farm Bureau Federation, the National Grange and the National Cooperative Milk Producers Federation will discuss the sub-ject Rural Youth Looks at Health. They will be guests of the American Medical Association dur-ing their stay in Chicago

On Saturday the program will include a discussion of the rural school health program and another on medical service in rural areas. Two of the many participants will be Dean F Smiley M.D., Chicago consultant on health and fitness of the Bureau of Health Education of the A.M.A. and Ralph V Platou M.D., New Orleans, head of the Depart ment of Pediatrics of the Tulane University School of Medicine Speakers at the Saturday lumbeon will be the Honorable Joseph H. Ball U.S. Senator from Milnesots, and Edward L. Bortz M.D. Philadelphia, president of the A.M.A.

The National Health Program of the American Medical Association states that "every child should have proper attention including scientific nutrition immunization, and other services included in infant welfare." In extending this program to the rural areas of the United States the American physician invites the help of the American farm family in protecting the rural child so that his future will be built on a heritage carefully and intelligently

planned .- 4.M.A News December 28 1947

UNTOWARD EFFECTS OF THE NEWER DRUGS

JOHN H TALBOTT, M D, Buffalo, New York*

(From the Department of Medicine, University of Buffalo Medical School, and Buffalo General Hospital)

DRIOR to the current era of medical science I the physician was largely dependent upon naturally occurring botanicals and minerals for his dispensable therapeutic agents. Bromides were employed for convulsions, colchicum for gouty arthritis, guinine for malana and other fevers, iron salts for anemia, iodine for thyroid disorders, forglove for heart disease, opium for pain, mercury for syphilis, ergot for contraction of the uterus, caffein for diuresis, and a variety of herbs and minerals for purgation Each therapeutic agent was effective in selected instances. sometimes the efficiency was high, at other times Most of these preparations are still in use and continue to accomplish great thera-On the other hand, and without peutic good exception, new and improved drugs, which have come largely from the chemical laboratory, have been introduced either to enhance or to replace each of the above-noted agents No wellinformed physician will deny the value of these never drugs Some small loss has accompanied a tremendous gain, however, and the untoward reactions of certain of the preparations in a percentage of the patients receiving accepted therapeutic amounts has led to serious or even fatal results

It is only human to minimize the untoward reactions of a new therapeutic substance in the enthusiasm of discovering and subjecting it to clinical trial It has been observed also that the full significance of an untoward reaction may not be appreciated until after months or even years of clinical trial have elapsed. On the other hand, if the drug were withheld from extensive use during such a period of collection of controlled statistics, patients not included in the control study would be deprived An approximate solution to the problem is essentially in effect New drugs are tried in selected patients by a small group of qualified clinical investigators Following this, if the new preparation has ment, a larger number of physicians is allowed the drug, having been informed of the possible sideeffects as well as the good effects Finally, full and complete evaluation is possible only after a prolonged period of time, meanwhile physicians and manufacturers should be as interested in untoward reactions as in favorable reactions Only in this manner is the comprehensive appraisal of the new preparation achieved

* Presented before the Scientific Session of the Alumni Clinical Day April 19, 1947 Buffalo, New York No attempt will be made to consider all the preparations that have been introduced for clinical use in recent years. Nine only will be considered in this communication. In many instances personal interest has prompted inclusion of the untoward effects of a particular substance. In other instances, extensive clinical use warrants discussion. The untoward reactions of the antibiotics in general use will be presented first.

Penicillin

The direct toxic or irritant effect of penicillin is unimportant except when given intrathecally Amounts as great as 30 million units per day have been administered parenterally with no recognized demonstrable local harm. Quantities of 1 to 3 million units per day may be given daily for several weeks with minimal local effects.

A tabulation of the systemic reactions of penicillin modified from Morginson is as follows ¹ Erythema, blotchy or diffuse, dermatitis medicamentosa, exfoliative dermatitis, angioneurotic edema, urticaria, pruntus, erythema multiforme, erythema nodosa, malaise, chills, fever, nausea, vomiting, mental depression, excitation, confusion, nervousness, dizziness, convulsions, peripheral nerve palsy, epistaxis, petechiae, purpura, serum sickness-like syndrome, eosinophilia, hematuria, and azotemia

The use of large single amounts (30,000 to 100,000 units) of penicillin intrathecally may be accompanied by serious local irritation such as arachnoiditis and transverse myelopathy2 and followed by headache, nausea, vomiting, muscle spasms, convulsions, or unconsciousness reaction is believed to be a direct toxic one for nervous tissue, is not an allergic response, and presumably is a function of the quantity of penicillin employed rather than the concentration It has been recommended, therefore, that not more than 10,000 units of penicillin in 10 cc of fluid be given intrathecally per dose daily injection of this quantity and concentration of penicillin for several consecutive days has not been associated in this clinic with any untoward responses Instances of peripheral neuritis of arms and legs have been reported following parenteral penicillin. The development of neuritis appeared to be unrelated to the site of injection Recovery begins rapidly following cessation of the drug but may not be complete for several months

Tissue sensitivity is probably the most serious reaction to be encountered in the general use of penicillin The antigenic property may be demonstrated by patch tests as well as by the Arthus phenomenon Sensitivity may follow the use of even crystalline preparations It may be immediate or delayed natural or acquired Obviously it is difficult to exclude sensitivity to penicillin as a result of acquired sensitivity to Acquired sensitivity may be produced by parenteral or local application and may not be evident until after a lapse of several weeks Patients with dermatologic conditions demon strate greater sensitivity than others. Particularly important in this respect is the application of penicillin directly to the cutaneous surfaces of the body Evidence is accumulating which suggests that the cutaneous use of penicillin should be condemned as a routine procedure First, it is doubtful whether the topical application of penicillin is endowed with any particular merit. Second, the possibility of sensitizing the patient appears to be greater following cutaneous application than by other routes Finally, a direct sensitivity reaction may be induced which defeats or complicates the intended therapeutic procedure It is concluded that if penicillin is indicated in the treatment of cutaneous lesions it should be administered parenterally in most instances.

The incidence of penicillin sensitivity in pa tients without an allergic history is not more than 2 or 3 per cent. It is considerably higher in patients who have had penicillin previously or who have an allergic history If a patient is sensitive to penicillin and the need for the drug is considered to be great small doses followed by increasingly larger quantities are advisable. Benadryl or pyrabenzamine is recommended as an adjuvant during therapy and for several days thereafter to control certain symptoms of sensitivity The incidence of Hercheimer reactions to penicillin is high in patients with tertiary luce particularly in debilitated persons. Desensitization doses should be considered in Yew of the high incidence of reactions, although they are not necessarily prevented by such a proredure.

Streptomycin

The most comprehensive summary of the toxicity of streptomycin was presented by Keefer in a survey of 1000 cases. The over-all incidence of side-effects was reported as 20 5 per cent. The larger the daily does the greater the incidence. When the daily does was 4 Gm. or greater the incidence of toxicity was 60 per cent. The toxicity of this antibiotic as was

noted with penicillin, is considered to be inherent in the active material rather than in impurities

Although streptomycin has been recommended in the troatment of certain acute and chronic bacterial infections, it is believed that it should not be used if other agents are equally effective and available. In regard to the treatment of tuberculosis specifically it is well to appreciate that streptomycin is no more than a bacteriostatic agent and tends to suppress toxicity but not necessarily to eradicate the infectious process. The greatest value at the moment appears to be in patients with tuberculous meningitis or acute disseminated miliary tuberculosis.

The untoward manifestations of streptomycin may be either acute or chronic Local irritation at the site of injection tends to be more aggravating than following the use of penicillin may be alleviated by the use of procesine in the injection fluid without inactivating streptomycin Central nervous system irritation from the intrathecal use of as great a quantity as 01 Gm. daily has not been reported Headache and flushing of the skin were more common in the preparations used initially and usually appeared within the first few days. Skin eruptions and fever are other symptoms of acute toxicity which may appear early in the course of treatment. The skin rash is nonspecific and promptly subsides after cessation of the drug. Streptomyon may be resumed in a few days if very small amounts are given and the quantity increased slowly and with caution to the previous level The development of econophilia as high as 10 per cent is evidence that streptomycin produces sensitivity. The appearance of hyaline and granular casts in the urine following the prolonged use of the preparation is noteworthy and deserves further study before adequate evalua-The tendency to form casts is reported to be greater in an acid urine

Vertigo and tinnitus are disturbing neurologic complaints Tinnitus appears early, while vertigo may not be noted for two or three weeks after beginning treatment. Deafness has been reported, but according to Keefer this symptom developed in patients with typhoid fever or meningitis and should be attributed to the disease and not to streptomycin ! Vertigo is the most troublesome symptom encountered during the prolonged use of the drug Clinical evidence indicates that most patients who-have received the drug for a period of weeks show some interference with vestibular function The changes are considered by some to be permanent, by others to be transient," but they are not looked upon necessarily as serious in view of the fact that a compensatory mechanism develops by

which visual and proprioceptive functions substitute for vestibular loss

Sulfonamides

Approximately ten years have elapsed since the sulfonamides were introduced into this Each newly discovered preparation offered fresh hope that it would be more effective in combatting infection and possess a minimum Realization of this hope has been of toxicity partial only, and the latest and most efficient sulfonamides still are endowed with toxic proper-Furthermore, the increasing number of persons who are given sulfonamides therapeutically or prophylactically may eventually sensitize a sufficient mass of people so as to constitute a threat to their health should there be a need for reuse of a sulfonamide Dowling and Lepper have reported the incidence of toxic reactions to each of the three commonly used sulfonamides 6 Reactions occurred in 299 per cent of a group of 498 patients treated with sulfapyridine. 11.8 per cent of 321 patients receiving sulfathiazole suffered from toxic effects, while only 7.7 per cent of 660 patients who were given sulfadiazine were so affected The reactions varied greatly in their study, some were serious. most of them were mild

The untoward reactions may be divided into direct toxic, mechanical, and allergic, respectively A more satisfactory means of presenting evidence against the sulfonamides, however, is to discuss the subject according to the organ or system A person receiving sulfonamides for the first time may note a general effect, such as nausea, vomiting, cyanosis, headache, dizziness, or mental confusion, which subsides if the drug is In some patients these symptoms may subside in spite of continuation of the drug Fever, another general reaction, may appear with the initial course of therapy or it may develop later as a sensitization phenomenon cidence of fever with a second course of sulfathiazole is considerably higher than with other sulfonamides Skin eruptions, varying from a mild erythema or erythema nodosa to a generalized exfoliative dermatitis or a generalized bullous eruption, may appear either with the first or second course of a sulfonamide

The use of sulfonamides applied directly to the skin for cutaneous ailments is fraught with even greater danger than with penicillin because of skin sensitization. It is believed that the local application of sulfonamides should be reserved for those few conditions which respond to this form of therapy and do not respond to other forms of treatment

The direct toxic effect of sulfonamides upon blood-forming organs has been held responsible

for the reduction of number of circulating red cells, white cells, and platelets, phenomena not infrequently observed during treatment 8 There is increasing evidence to suggest, however, that some of these changes may be related to sensitiza-Acute hemolytic anemia occurs particularly after the use of sulfandamide and sulfanyri-Evidence of anemia may be noted as early as the first day and usually before the fifth day Anemia develops rapidly and may be severe, but when the drug is stopped and whole blood transfusions given, recovery is prompt Agranulocytosis and leukopenia are prone to follow the use of sulfanilamide and sulfapyridine and, when they appear, do so between the second and third week. Twenty per cent of all children who received sulfonamides in a series reported by Menten had a neutropenia 8 A few had agranulocytosis Large amounts of one of the preparations over a prolonged period of time was held responsible in each instance for a fatal reaction Prior to the use of penreillin, pyridoxine, and folic acid in combatting agranulocytosis from sulfonamide intoxication, the mortality rate was high

There is increasing evidence that sulfonamides affect nervous tissue as well as other types of tissue. Optic neuritis and peripheral neuritis have been observed since the early days of use of these substances. Psychologic disturbances include psychoses, hallucinosis, delusions, and schizophrenic symptoms which usually disappear upon withholding the drug. One case of encephalopathy and renal damage has been reported by Maisel, Kubik, and Ayer. Death followed the intake of relatively small amounts of sulfamilamide, sulfathiazole, and sulfadiazine. Diffuse cerebral and cerebellar changes were noted postmortem.

A considerable volume of data has accumulated concerning the renal changes associated with sulfonamide intoxication 10-12 Hematuria, oliguria, anuria, and azotemia have been reported and in many instances crystals of sulfonamides or the acetylated forms are observed in the urinary Careful pathologic preparations have demonstrated similar accumulations of crystals in renal tubules and ureters - It is assumed from a study of patients who have succumbed as a result of this complication that the crystals are precipitated out in the distal portions of the renal tubules as the urne becomes acid chanical insult and obstruction follow chain of events may occur with sulfapyridine, sulfathuazole, or sulfadiazine Since precipitation in the tubules is enhanced by an inadequate urmary output combined with acidification of urine, the prophylactic and therapeutic indications in the prevention of sulfonamide precipitation include an adequate fluid intake and ingestion of alkaline substances In addition to the mechanical and irritative effects of obstruction from deposition of crystals, the kidneys may be the locus of tissue sensitization. Kidneys of patients dying from sulfonamide into acation in such instances have been examined with par ticular attention being given to the identification of precipitated crystals and none has been found Instead focal necrosis, vascular changes, thrombi in the interrenal veins, and an arteritis point to a sensitization phenomena as being responsible Interesting variations in the acid-base balance of the blood have been studied by Luetscher and Blackman in a small sories of cases of renal failure associated with sulfonamide intoxication 12 Ex tremely high serum sodium and chloride con centrations progressed, meanwhile azotemia and oliguria decreased under appropriate therapy

The occurrence of hepatic damage in children following sulfonamide therapy has been studied by Menten and Andersch 14 They observed various types of lesions at pathologic examination The incidence of liver damage in children suggests that this organ may be more susceptible to toxins in the young than in adults. The insult did not appear to be related directly to the quantity of drug taken A toxic colitis has been observed by Gauss and Weinstein in three patients 18 In one patient sulfathiazole was believed responsible in the two others, sulfapyridine was the offender With the withdrawal of the sul fonamides all symptoms subsided and the colon resumed its normal appearance Cardiac arr hythmias have been observed in sulfonamide in toxication, but otherwise little note has been made of the action of these drugs upon the heart.

The factor of tissue sensitivity has been noted in the preceding discussion of organ pathology and is demanding increasing attention in conaderations of sulfonamide intoxication reactions in this category are interpreted as an allergic response to foreign substances unlike those that may follow the parenteral administration of foreign proteins Subsequent to the use of the drug for the first time the sensitization phenomenon máy not appear for eight or ten days. On the other hand patients who have had a previous course may have an immediate or anaphylactic reaction within twenty four hours The difficulty in diagnosing a senattvity reaction to sulfonamides in a patient under treatment for an acute infection is readily apparent. Several of the signs and symptoms of a toxic reaction are similar to those of the initial The development of urticaria may be of diagnostic help. Also the time of development of symptoms may be a useful cue administration of one sulfonamide does not appear to sensitize a person to one of the other

sulfonamides, nevertheless, the incidence of reactions following the intake of a second sulfonamide is greater in persons who have experienced a reaction with a previously ingested preparation than in those who have a negative history for such a reaction. It is apparent that if a person has had a reaction with one sulfonamide and the need arises subsequently for additional sulfonamides, a different preparation should be considered.

One of the best pathologic studies of sulfon amide sensitivity has been reported by Rich 17 He observed an acute arteritis and penartentis pathologically in patients who had received antipneumococcus horse or rabbit serum and sulfadiasine usually the two were prescribed to-The pathologic findings similar to perartentis nodosa present convincing evidence of the potential harm from sulfonamide sensitiza This problem has been investigated also by French who examined the pathologic material in the Army Medical Museum from 76 autopsies and 2 biopsies from patients who had been sensitized to sulfonamides 13 Acidophilic histiocytes were present in focal and diffuse infiltra tions throughout the body He concluded that 'sensitization of large groups of patients with prophylactic doses of sulfonamide drugs may result in an increase in the number of histopathologic lesions encountered at autopsy Many of the lesions are significant causes of death Increased caution must be observed in the prophylactic and therapeutic use of the sul fonamide drugs for minor infections "18

Sulfonamides should not be prescribed unless there is adequate clinical evidence to warrant their therapeutic use. Optimal amounts only should be given and an excess avoided drug should be discontinued as early as possible. Finally sulfonamides should not be given if other methods of therapy are equally efficacious. It is apparent that the incidence and severity of untoward reactions from sulfonamides have caused them to be considered potentially a more harmful preparation than penicillin. Standardization of doses for penicillin has not yet become precise but no evidence has been forthcoming which shows that an excess of penicillin does any particular harm. Sulfonamides on the other hand become increasingly toxic as the quantity increases.10

Benadryl

Drowiness, nervousness, fatigue nausea hypotension, paresthesias, confusion blurred vision, coloma and chilliness respectively, have been reported as untoward symptoms following intake of bonadryl. In one series, 63 per cent of the patients reported one or more of these symptoms. In a few instances the side-reactions have been

severe and with increasing use of this preparation. or similar ones, other untoward results may be observed 20 Mental lethargy, drowsiness, and paresthesias are presumably intensified side-Vasomotor collapse and a shock-like syndrome have followed the use of benadrvl in acceptable therapeutic quantities Difficulty in coordination and muscular twitchings to the extent of epileptiform movements have been noted on one instance The prompt cessation of untoward symptoms following discontinuance of the drug has tended to reassure physicians in prescribing it The body presumably does not store benadryl, and the possibility of an accumulative action is minimal

Demerol (Meperidine hydrochloride)

The side-effects of demerol usually are not disturbing but include dizziness, sweating, syncope, nausea with or without vomiting, vomiting without nausea, euphoria, headache, and anxiety ²¹ Intravenous injection may be followed by a marked drop in systolic and diastolic blood pressure, hence demerol should not be prescribed by this route. The decrease in respiratory rate following administration of demerol to patients with increased intracranial pressure has led Guttman to issue a note of caution in this condition ²²

Since demerol is effective in the control of pain, it is not surprising that patients may become addicted to the use of this drug without a previous history of opium addiction 23 Not only have patients developed a striking tolerance to demerol but they become physically dependent upon it and develop an intense desire for repetition of pleasant sensations associated with its use The usual therapeutic dose is approximately 100 mg, given not oftener than every three hours From 300 to 500 mg every three hours is not unusual in demerol addiction and in certain cases as much as 4,000 mg per day have been required for satiation The same precautions in regard to addiction should be exercised in prescribing demerol as are routine in prescribing an opiate 24

Thiouracil

A diverse type of reaction is associated with thiouracil therapy in an occasional person Williams has reviewed this subject and lists as possible reactions edema of the legs, headache, nausea, vomiting, diarrhea, jaundice, purpura, hematuria, fever, urticaria, maculopapular rash, arthritis, lymphadenopathy, oral sepsis, and psychosis ²⁵ None of these reactions has led to serious or fatal complications, and cessation of the drug usually is associated with subsidence of the untoward effects. A more serious sequela of thiouracil therapy is leukopenia, which occa-

sionally progresses into agranulocytosis Van Winkle and associates observed an incidence of 2 5 per cent of agranulocytosis in a series of more than 5,000 patients under observation in 328 clinics ²⁶ The appearance of agranulocytosis is most frequent during the second month after beginning treatment ²⁵ It is believed that the time element is more important than dosage in development of agranulocytosis. Age and sex appear to be unimportant. Approximately 30 per cent of the patients with agranulocytosis in the above-noted series died.

Precautionary measures are important in patients receiving thiouracil During the second and third months, particularly, blood counts taken weekly or oftener should be routine other times, and as long as the patient continues taking the drug, complete blood studies should be performed at least once a month first indication of leukopenia or agranulocytopenia, thiouracil should be discontinued the first sign or symptom of systemic toxicity. such as fever, malaise, or sore throat, rigorous anti-agranulocytosis therapy should be started From 500,000 to 1,000,000 units of penicilin daily in divided doses are recommended until evidence of infection has disappeared usually requires a minimum of one week value of other agents is less definitive blood transfusions undoubtedly are helpful Pentonucleotid long has been used for agranu-The value of this drug continues to locytosis be uncertain Crude liver extract and folic acid also have been given a trial Newman and Jones report the development of agranulocytosis during thiouracil therapy combined with folic acid as a prophylactic drug 27 Pyridoxine hydrochloride has been reported by Williams to be of value 25 Since the sulfonamides may depress bone marrow, their use in the treatment of agranulocytosis is contraindicated Propyl or methyl thiouracil has been used too short a time to determine the type and incidence of toxicity, although from preliminary reports they appear to be considerably less toxic than thiouracil

Tridione

The use of tridione was accompanied by few untoward symptoms during the first eighteen months of clinical trial. Skin rashes, lightheadedness, nausea, and blurring of vision in bright light were usually sufficiently mild to justify continuation of the drug in view of its great value in control of petit mal. Recently, several deaths following the development of agranulocytosis, aplastic anemia, and thrombocytopenia have been noted in association with tridione therapy. The severe insult to the hematopoietic system develops several months

after beginning treatment. Once symptoms of profound toxicity have appeared, heroic measures have been instituted without success Large amounts of penicillin and whole blood transfusions have been of no avail. In view of the fatal result of the reported cases a closer control of patients receiving tridione should be maintained Mackay and Gottstein suggest the following precautionary routine tient with a blood dyscrasic should receive this drug Other anticonvulsive drugs should be given a trial first. A complete blood count should be obtained at least once a month on each patient. In women at the time of the menses the blood elements should be watched particularly Patients should report any untoward symptom, especially in relation to symptoms of anemia, agranulocytosis and thrombocytopenia "20 It is also stated that the drug should not be given to patients with renal or liver disease

Bal

Bal, 2,3-dimercaptopropanol or British anti lewinte, a product of war research has been recommended for the treatment of arsenic pol soning, especially arsenical dermatitis acute bichloride of mercury poisoning and chronic gold, cadmium, zinc or copper poisoning 11 The intramuscular or subcutaneous routes com prise the usual means of administration in the treatment of civilian medical conditions. Toxicity has been reported as minimal when prescribed in the recommended doses of less than 3 mg per Kg of body weight for arsenic poisoning and less than 5 mg per Kg in acute mercury poisoning. In a few instances nausea, vomiting headache burning sensation about the face lac rimation salivation, paresthesias of the extremitles, a constriction of the throat and chest and an elevation of systolic and diastolic blood pressure have been observed They appear within fifteen or twenty minutes after the injection Each of these effects is temporary in duration

Nitrogen Mustard

The use of nitrogen mustard methyl-bis(schlorethyl)-amine hydrochloride in patients with neoplastic diseases has opened a new approach to the treatment of selected conditions. It also has given the physician a powerful drug with important side-reactions. Unless great care is exercised during injection local irritation of the sum or thrombophlebitis of the vein may follow. The best preventive is to inject the material into the rubber tubing after an intravenous infusion is running in good order. Nausea and vomiting may appear within one or two hours and persist for a similar length of time. ¹² These symptoms

are less prone to develop if the patient has been fasting for twelve or more hours

The delayed systemic effects may be senous but are interpreted as exaggerated therapeutle responses. The lymphoid tissue may be insulated severely with disappearance of circulating lymphocytes, leukopenia, and granulocytopenia without signs or symptoms of agranulocytosis Thrombocytopenia, purpura, and anemia are additional evidences of toxicity to the hematopoietic system The changes in the peripheral blood may appear within twenty four hours after the first injection The total leukocyte count declines progressively for fifteen to twenty days During the third week there may be a morbid reduction in platelets. Recovery from the leukopenia is not influenced by pentonucleotid, folic acid, or transfusion of whole blood 32 In view of the narrow margin of safety, great caution should be exercised in using the drug and the peripheral blood should be studied every three or four days during and for three weeks after completion of the course The use of nitrogen mustard is still in a highly experimental stage and is not recommended as yet for general use even in those diseases which appear to be benefited, i.e. lymphosarcoma, Hodgkin's disease and polycythemia vera

Summary

The untoward reactions of several of the newer drugs have been recounted. In most instances the side-effects are inconvenient and not serious and subside with cossation of the use of the drug On the other hand irreparable and mortal changes have followed the use of some of the substances in an occasional instance. Prophylactic and precautionary measures should be observed with each drug that has been shown to be potentially harmful. Careful watch should be maintained in each patient even though there is no visible evidence of toxicity To know when to stop a drug is frequently as important as to know when to prescribe it. Finally, it is the duty of every physician who is prescribing either new or established preparations to observe carefully untoward reactions and to report them either to the manufacturer or in a medical publication the number of new drugs increases and we know that this will be a fact, continued vigilance should be practiced

NATIONAL MENTAL HEALTH PROGRAM IS LAUNCHED

The national mental health program, authorized by Congress in 1946 and implemented on July 8. 1947 by an appropriation of seven and a half million dollars, is now underway, Dr Thomas Parran, Surgeon General of the US Public Health Service has announced

The program calls for activity in three major (1) increased research into problems of fields mental health, (2) increased training of urgently needed personnel, and (3) increased support and stimulation of state efforts to develop adequate mental health programs, particularly in the field of

prevention and early treatment Approximately \$400,000 will be spent during the fiscal year 1948 for research Grants-in-aid are provided to universities, hospitals, laboratories, and other public and private institutions and to qualified individuals With these grants 25 research projects will be conducted in such fields as biochemistry, neurophysiology, delinquency, child psychology, alcoholism, psychosomatic medicine, psychotherapy, shock thorapy The fund also provides research fellowships in fields related to mental

health, of which 14 have been awarded Over one million dollars will be spent for grants to

public and other nonprofit institutions for the development and improvement of facilities for training mental health personnel Grants include 17 in the field of psychiatry, 16 in clinical psychology, 9 in psychiatric social work, and 9 in psychiatric nursing This fund will also provide for training stipends for 70 graduate students in psychiatry, 41 in clinical psychology, 40 in social work, and 58 in psychiatric nursing

Institutions in New York State receiving the grants for psychiatry include Babies Hospital of the Presbyterian Hospital, Columbia University, College of Physicians and Surgeons, Columbia University, and Cornell University Medical College A grant for clinical psychology was awarded the University of Rochester and a grant for psychiatric social work was given to the New York School of Social Work, Columbia University — Mental Hy-

giene News, Oclober, 1947

THE OCCURRENCE OF WATER-SOLUBLE Rh SUBSTANCES IN BODY SECRETIONS

JAMES F MOHN, M D and ERNEST WITEBSKY M D . Buffalo New York

(From the Department of Bacteriology and Immunology University of Buffalo School of Medicine and the Laboratories of the Buffalo General Hospital)

THE blood group specific characteristics A and B occur in large concentrations in most of the They also are present in the body secretions majority of the tissue cells of the human body The name "blood groups," therefore, is a missit and should be changed to 'tissue groups". In contrast, the occurrence of the Rh factors outside the red blood cells has been the subject of much discussion and many disagreements Wiener and Forer,1 as well as Levine and Katzin,2 claimed that human raliva is free of water-soluble Rh substances On the other hand, Boorman and Dodd found evidences of small amounts of Rh soluble substances in half of the saliva specimens. obtained from Rh-positive individuals. We have demonstrated the occurrence of water soluble Rh substances in the majority of amniotic fluids although only in low concentrations.4 Because of the importance of the subject and the discrepancy of opinions, three human secretions, namely, saliva, gastric juice, and further amniotic fluids, were examined for their content of Rh substances.

Examination of Saliva

Thirty saliva specimens were examined undiluted saliva specimens in many cases were too viscous to be used and had to be diluted with at least equal volumes of physiologic saline solution The diluted saliva specimens were then thor oughly centrifuged and the supernatants used for examination. In order to counteract the possible presence of enzymes known to be active against blood group specific substances in saliva the specimens were divided into two parts. One part was boiled in a water bath from one to five minutes, the other part was not boiled or three instances the results gave the impression that small amounts of Rh substances were present in both the boiled and unboiled preparations but because of the viscosity of the material and the impossibility of further dilution of the specimens the presence of Rh substances in appreciable amounts in saliva could not be determined

Examination of Gastric Juices

An entirely different picture resulted when sastric juices were examined for the presence of

water-soluble Rh substances Specimens of gustric juice for this study were obtained from patients subjected to the procedure of gastric analysis Immediately upon being received in the laboratory, the specimens were tested for acidity or alkalinity with intrazine paper. Acid specimens were neutralized with tenth-normal or normal NaOH solutions to a pH of 72-74 by using phenol red papers. The specimens were then centrifuged thoroughly, and the supernatant fluids used for testing.

The results of the examination of 22 specimens are recorded in Table 1. Two of these came from Rh negative individuals, 20 from Rh positive individuals. Of the 20 specimens obtained from Rh positive individuals, 12 showed the presence of Rh substances and 8 failed to do so. Seven of the positive specimens showed relatively large amounts of Rh substances.

TABLE 1 —Analysis of a Series of 22 Specimens of Gasteic Juice for Re Secretion

•	Non-secretion	5
	Mon-poctetion	

The method used for the demonstration of water-soluble Rh substances was the inhibition of agglutination technic. An example illustrating this type of exporiment is shown in Table 2

Undiluted and 5 times diluted gastric juices (volume 0.05 cc.) were mixed with 0.05 cc of anti-Rh globulin (Kru) diluted 1.20 and incubated for two hours in the feebox (4 C). After standing for ten minutes at room temperature, 0.05 cc of a 3 per cent suspension of Rhi cells belonging to blood group O was added. The mix tures were allowed to remain at room temperature

Presented at the 141 t Annual Meeting of the Medical Society of the State of N w York Buffalo, Secti a on I athorogy and Clinical Pathology May 8, 1947

for one hour and then were centrifuged at medium speed for one minute and read macroscopically for agglutination

This experiment revealed the following facts (1) Gastric nuice No 22 from an Rh-negative individual did not inhibit the agglutination of Rh-positive cells by anti-Rh globulin Neither did the gastric juice from Rh-positive (3) On the other hand, speciindividual No 15 mens Nos 19 and 17 definitely prevented agglutination of Rh-positive cells by anti-Rh globulin. indicating the presence in these gastric juices of Rh substances which combine with the Rh anti-(4) Gastric juice No 16 prevented agglutination of Rh-positive cells to a certain, but not Such gastric juices have been definite, extent labeled weakly positive for Rh substances

In addition to the 22 gastric juice specimens, obtained from individuals with a known Rh type, 24 specimens were procured from individuals from whom we could not obtain blood for the determination of the Rh factor * A few of these gastric juices contained rather remarkable amounts of soluble Rh substances as shown in Table 3 In this experiment three gastric juice specimens were examined for their content of Rh substances

TABLE 3 —Agglutination of Rh Positive Human Red Blood Cells by Anti-Rh Globulin After Treatment of the Latter with Gastric Juices

Part I —Agglutination Human Red Blood Cells (Rh. Type) by Anti-Rh Globulin

Neutralized Gastric Juice Supernatants	No 5B	Hooper	No 1
Undiluted 1 3 1 9 1 27	 ++ +++	 + +++ +++	+++ +++ +++ +++

Part II.—Agglutination Human Red Blood Cells (Rh₁ Type) by Anti-Rh Globulin

Neutralized Gastric Juice Supernatants	No 5B	Hooper	No 1
Undiluted 1 3 1 9 1 27	- - - + +++	- ++ ++ +++	+++ +++ +++ +++

PART III.—Agglutination Human Red Blood Cells (Rh. Type) by Anti Rh Globulin

Neutralized Gastric Juice Supernatants	No 5B	Hooper	No 1
Undiluted 1 3 1 9 1 27	- - - + +++	++ +++ +++ +++	+++ +++ +++ +++

Decreasing amounts of gastric juice (volume 0.05 cc) were mixed with 0.05 cc of anti-Rh

globulin (Dem) diluted 1 50 and were kept for two hours in the icebox (4 C) After standing for ten minutes at room temperature, 005 cc of a 3 per cent suspension of Rh-positive cells was The mixtures were allowed to remain for one hour at room temperature and were then The experiment was carried out in centrifuged three parts In Part I, Rho group O cells were added, in Part II, Rh, group O cells, and in Part III, Rh2 group B cells For use with the Rh. group B cells, the anti-Rh globulin was neutralized by the addition of the isolated blood group specific substances A and B 5 The results are recorded in Table 3

This table clearly indicates the following facts (1) Gastric juice No 1 failed to inhibit the agglutination of Rh-positive cells by this respective anti-Rh globulin (2) Gastric juice No 5B definitely inhibited the agglutination of all three Rh-positive cells, namely Rh₁, Rh₂, and Rh₀, by the anti-Rh globulin (3) Gastric juice Hooper inhibited the agglutination of Rh, and Rh, cells. but did not at all inhibit the agglutination of Rh2 cells, indicating the qualitative differences of the subtypes of the Rh factor in gastric juices However, this marked specificity as shown in Table 3 by gastric juice Hooper was not the rule, for the majority of gastric juices inhibited both the agglutination of Rh1 and Rh2 cells, provided they contained any Rh substances at all

Examination of Amniotic Fluids

The occurrence of water-soluble Rh substances in amniotic fluids has been reported previously In contrast with saliva, and even gastric juice, amniotic fluid is easy to work with, since it is usually not viscous and is relatively poor in pro-By means of one anti-Rh serum, which was obtained from a patient in large amounts and which proved to be most suitable for examining amniotic fluids, the presence of Rh substances could be demonstrated in at least 4 out of 5 amniotic fluids originating from Rh-positive babies At that time the following conclusions were drawn (1) Rh substances do occur in amniotic fluid Careful selection of Rh antisera is essential, as not all such sera are suitable for the detection of Rh substances in amniotic fluid (2) The baby's and not the mother's Rh type determines the presence of Rh substances in amni-(3) There are Rh positive cases in which the Rh substances are not secreted, so-(4) The secretion of Rh called non-secretors substances into amniotic fluid is independent of the secretion of the blood group specific substances (5) Amniotic fluids of three erythroblastotic babies did not contain water-soluble Rh substances, and thus these Rh-positive babies belonged to the group of non-secretors

^{*} We are obligated to Dr Ellen Eckstein for obtaining the material under discussion.

TABLE 4.—ADDITINATION OF REI CELLS BY ANTI RE GLOBULIN APPER TERATMENT OF THE LATTER WITH NATIVE AND CONCENTRATED AMPRIOTIC FLUIDS

Amniotic Fluids from Rh-Positive Babies							Amniot from E blastoti	ie Fluid rythro- le Baby		
Liquor Amnii	No.	247	No.	356	No.	259	No.	B09	No.	170
Preparations	Native	Cone.	Native	Cone.	Native	Cona,	Nativo	Cone.	Native	Сове.
Undiluted 1:3 1:4 1:5 1:16 1:32 0	##	1111+++	###	##		1 - 1 - 44+	## ### ###	‡‡‡ ‡‡‡ ‡‡‡	† † † † † † † † † † † † † † † † † † †	### ### ### ###

However, two major difficulties were encoun tered in examining ammiotic fluids for Rh substances. First of all, in certain instances the content of Rh substances was so weak that the interpretation of the results was not definite Secondly, there seemed to be considerable difficulty regarding the Rh antiscrum used for the examination. As a matter of fact, many anti-Rh sera were not suitable at all for these determina

In order to clarify and further strengthen the evidence submitted, attempts were made to con centrate and purify the Rh substances occurring in amniotic fluids. At first, purification of the material by chemical means, such as precipitation with alcohol, acetone, and other agents used for concentration purposes, was attempted ever, the Rh substances seem to be rather clusive and sensitive when exposed to chemical reagents For that reason we finally used the following procedure Amniotic fluids were first spun down in the centrifuge at high speed and sedimental material removed as far as was possible. The fluids were then filtered through a hard paper filter, using gentle suction, and were dialyzed for approximately twenty hours against cold running tap water and for two hours against distilled Water (4 C) Any precipitates occurring were removed by centrifugation, and the remaining clear fluids were dried by lyophilization purification, amniotic fluids were concentrated 10 times, that is for each original volume of 100 co d annuotic fluid that was dried, 10 cc of physiclogic saline solution was added for resolution

The next experiment, as shown in Table 4, was carried out in the following manner Decreasing amounts of (a) native amniotic fluids, and (b) 10 times concentrated amniotic fluids (volume of each 0.05 cc.) were mixed with 0.05 cc. of anti-Rh globulm (Kru) diluted 1 12 and moubated for two hours in the icebox (4 C) After standing for ten minutes at room temperature, 0 05 cc. of a 3 per cent suspension of Rh; cells belonging to blood group O was added After being shaken well, the mixtures were allowed to remain at room temperature for one hour and were then centrifuged at medium speed for one minute and read macroscopically for agglutination.

The experiment shows that the specificity of the reaction is maintained inasmuch as the amniotic fluid (No 179) obtained from an erythroblastotic baby, known to be a non-secretor. did not inhibit the application of Rh positive cells by anti-Rh globulin even after the fluid was concentrated 10 times. On the other hand, one of the amniotic fluids (No 259), known to contain Rh substances, considerably increased its inhibitory power following concentration inhibitory power of amniotic fluid (No 256) increased only slightly The examination of the native amniotic fluid (No 247) would appear to reveal the presence of very slight amounts, if any, of Rh substance However after purifica tion and 10 times concentration, excellent inhibition resulted Amniotic fluid (No 309) did not change at all, as a matter of fact, it proved less inhibitory than before dialysis and concentration We are inclined to interpret this result as an indication that this amniotic fluid does not contain Rh substance and must be considered a non-

secretor The simple method of dialysis and concentra tion seems to allow more definite differentiation between secretors and non-secretors of Rh substances as far as amniotic fluids are concerned The problem of weak secretors can be decided one way or another Concentration has shown, as was expected, that some of the weakly inhibiting native amniotic fluids actually contain Rh substances which could easily be demonstrated by this procedure. This is in direct contrast with others which, after processing, failed to do so and, therefore, could definitely be classified as nonsecretors.

Conclusions

The occurrence of Rh substances in saliva could not be determined with any degree of cer-

no aggiutination
to faint aggiutination
dist aggiutination
marked aggiutination
the strong aggiutinati

tainty If present, they were in such low concentrations as to make their demonstration impossible, at least by the methods used in these studies, because of the viscosity of the material

2 Rh substances in a water-soluble form are excreted into at least half of gastric juices and into an even larger percentage of amniotic fluids. Whether this difference in percentage distribution is an actual one or due only to the possible damage to the Rh substances caused by the chemical treatment of gastric juices before they can be examined, cannot be determined at present

3 The simple method of purification and concentration of amniotic fluids, as described, seems to allow more definite differentiation between secretors and non-secretors of watersoluble Rh substances

DISCUSS HUMAN HEALTH BEHAVIOR

Dr Dean F Smiley of the AMA. Bureau of Health Education took part in a symposium held in connection with the annual meeting of the National Association of Biology Teachers, December 30, in Chicago The meeting was held in conjunction with the annual session of the American Association for the Advancement of Science and was particularly for teachers of the secondary schools on the subject of behavior

In his paper on "The Contributions of Medicine to Human Health Behavior," Dr Smiley pointed out the error of the traditional belief that the medical profession is only incidentally interested in preventing disease and developing positive health. On the contrary, among physicians themselves, it is well recognized that the most effective way to attack disease is to apply constructive and preventive

The medical profession not only provides many facts as a basis for establishing new habits or modifying old habits, but it also makes it its business to apply these new facts. Among the ways in which medicine applies new found facts are (1) in advising patients regarding their personal hygiene, (2) in administering the public health programs, (3) in carrying on public health education, and (4) in contributing to school and college education

Dr Smiley made a plea to scientists, physicians, biology teachers, science teachers, health educators, and physical educators to set about equipping our young people with the kind of health knowledge that will enable them not only to better understand the modern world's increasing complexity but also to utilize to the fullest its increasing opportunities—A M.A. Secretary's Letter, January 5, 1948

INTERNATIONAL SURGICAL ASSEMBLY

The Sixth International Assembly of the International College of Surgeons will be held in Rome, Italy, at the invitation of the Italian Government, during the week of May 16 to 23, 1948, under the presidency of Professors Raffaele Bastianelli and Raffaele Paolucci of Rome, and Mario Dogliotti of Turin The secretary of the Assembly is Prof Giuseppe Bendandi of Rome

Attendance is not limited to the membership of the college, all surgeons in good standing in their medical organizations are invited. Scientific meetings, scientific and commercial exhibits, visits to the Universities of Turin and Milan have been arranged, together with tours to other medical centers in Europe.

A special evhibit of ancient texts on surgery is being arranged by Prof Davide Giordano of Venice, honorary president, under the active presidency of Prof Adalberto Pazzini, professor of history at the University of Rome. This extraordinary exhibit dealing with ancient surgery will be on display in the Vallicelliana Library in one of the historical buildings of the Vatican.

Detailed information may be obtained from Dr Max Thorek, general secretary, 850 Irving Park Road, Chicago 13 For travel information, address the All Nations Travel Bureau, 38 South Dearborn Street, Chicago, the official travel representatives for this Assembly

Those desiring to present scientific papers address Dr Karl Meyer, Cook County Hospital, Chicago, Dr Henry W Meyerding, Mayo Foundation, Rochester, Minnesota, or Dr Herbert Acuff, Acuff Clinic, 514 West Church Street, Knoxville, Tennes see

PROTHROMBIN TIME IN RHEUMATOID ARTHRITIS

Louis W Granters MD, Broad Channel, New York

(From the New York Post-Graduate Medical Achool and Hospital)

THE use of gold salts in rheumatoid arthritis I may cause hepatic cell damage in any one of three ways direct injury to liver cells, hemolyals with injury to liver cells either directly or by products of hemolysis, or by means of hypersensitivity or allergy 1 While it is true that 25 per cent of patients treated with gold salts sooner or later develop a akın rash, stomatitis, or gustrointestinal symptoms, most of these reactions are of a mild character Since the publication of Hartung's and Freyberg's studies, the trend in this country is toward smaller doses of gold salts 43 Large doses of gold salts by mouth or intravenously given to animals produce destructive and fatal legions in the liver and kidneys. Tone hepatitis, however, is an infrequent sequela. The toxicity of gold, like that of other heavy metallic salts, depends to some extent on the dosage employed

On the whole a laboratory test in liver disease is not very distinctive and its chief value lies in its revealing in a rough measure the ability of the liver to perform a certain specific function. Our problem was to determine whether or not there would be prothrombin deficiency following the use of gold salts and if so, whether the administration of vitamin K with bile salts would be

ational therapy

Method

In the laboratory of the New York Post-Graduate Medical School and Hospital the Link Shapiro modification of Quick's method for determining blood prothrombin levels is used 4.8

Blood samples were taken by mixing 0.9 cc. of blood quickly with 0.1 cc of tenth molar sodium coalstc. The exalated blood was centrifuged at 1.700 revolutions per minute for ten minutes. The clear plasma was then transferred with a pipet to a test tube. The clotting time of the plasma should be determined at once, but if it is stored in a refrigerator, the plasma will remain fairly stable for several hours.

If diluted plasma is to be used, 0 1 cc is transferred into a 75- by 10-mm test tube and diluted with 0.85 per cent sodium chloride. To obtain a plasma concentration of 12 5 per cent, 0 1 cc of plasma is diluted with 0.7 cc. of saline solution The diluted plasma is mixed thoroughly and placed in a constant temperature water bath at 7 C. The plasma is mixed conveniently by

holding the test tube firmly near the top with the thumb and index finger, and striking the lower end sharply with glancing blows with the index finger of the other hand. This accomplishes a thorough mixing without contamination.

With a 0.2 co pipet (micro blood sugar), 0.2 cc. of the thromboplastin-calcium chloride suspension is transferred into 100- by 12-mm test tubes. These tubes are placed in a rack beside the diluted (or whole) plasma samples in the constant temperature bath. As soon as the contents of the tubes have reached the bath temperature, the clotting time of the plasma is deter

mined as follows

The diluted (or whole) plasma is shaken again and transferred with a 0 1 cc. pipet (micro blood sugar) to a tube containing 0.2 co of the thromboplastin-calcium chloride suspension The diluted plasma is blown quickly from the pipet same time the stop watch is started. (The stop watch is conveniently operated by a foot treadle.) The tube is tapped sharply to mix the solutions This insures a uniform initiation of the clotting process throughout the solution stirrer made of No 22 nichrome wire with a loop on the end is now introduced During the clotting process the solution is stirred at such a rate the the stirrer loop sweeps across the test tube from one side to the other two times per second. The end point (formation of the clot) is that point at which the fibrin clot is sufficiently stable to be drawn to one side by the stirrer, thus bring ing into view a clear area. The clot is usually somewhat turbid, since the calcium ovalate formed upon calcifying the oxalated plasma is enmeshed in the clot. The formation of fibrils which impart a viscous appearance to the solu tion before the clot forms, can be disregarded The number of seconds required for clot formation 15 recorded

Normal standards are as follows whole plasma prothrombin time—14-17 seconds, di luted (12 5 per cent) plasma prothrombin time—37-42 seconds. It is always advisable to determine the activity of the thromboplastin by determining the prothrombin plasma elotting time for whole as well as diluted plasma in order to determine whether the figure falls between the above values. (This material should be kept under refrigeration as its activity decreases if not properly stored.)

TABLE 1

Normal-14-17 seconds. † Normal-37-42 seconds.

Discussion

Prothrombin is a constitutent of blood plasma formed in the liver and is believed to be a pseudo-An adequate supply of vitamin K is essential for a normal blood coagulation 6 Consequently, adequate hepatocellular function and vitamin K absorption are essential for normal plasma prothrombin concentration wide range of safety in the prothrombin factor so that the coagulation time may remain within normal limits until 80 per cent of the prothrombin

of the blood has been lost. When the concentration of the plasma prothrombin falls below 30 per cent of normal, the prothrombin time becomes longer than 20 seconds, the upper limit of normal All of the following patients treated at the Arthritis Clinic were on continuous gold therapy for at least one year with solganal B and crude liver extract intramuscularly. The first and eighth patients had had a mild gold dermatitis

Summary

(Table 1)

In 15 patients treated for one year with therapeutic doses of solganal B and crude liver extract, there was no increase in the prothrombin

which disappeared when the gold was stopped

1002 Cross-Bay Boulevard

"DOCTOR JONES" SAYS-

A fellow, awhile ago, was telling me about some of this new airconditioning business. If you wanted it warmer or cooler or wanted more ventilation or more or less humidity, all you had to do was turn a knob or something And, you know, I was thinking if we could regulate our mental attitudes like that we'd live longer, accomplish a lot more in life and do it easier

There's no doubt but what a considerable part of our difficulties, our failures, and the wear and tear on our system-it's the result of fear that we won't be able to do the things we want to do or think we ought to More or less unconsciously we build up obstacles that don't exist 'til we've created 'em

Remember the little poem (I learned it when I as a boy) about the fellow "Somebody said that was a boy) about the fellow it couldn't be done But he, with a chuckle, replied That maybe it couldn't but he'd not be one To say so 'til he tried' —and so on' My mother, when I was small, told me there was 'no such word as 'can't'' Well, like some other things, I took it too literally I found it, later, in the dictionary, so I concluded she must've been wrong. But the idea she was trying to convey-I recognize now word that's greatly overworked

When we get some understanding of how our minds work and the part our imaginations play in our lives it's possible, if we've got the intelligence, backbone, and perseverance, to cultivate healthy mental attitudes It ain't as easy as just moving a switch or turning a knob but it can be done—up to a certain point Anyway, it's worth trying and 'l'll try' is a lot more stimulating slogan than "I can't"

If we can sift out the imaginary and unnecessary obstacles we'll be in better shape to deal with the unavoidable ones Like the old fellow I heard of down in the Ozarks He was sitting on the porch rocking due north and south. On the other end, in another rocking chair, his son, age forty, was rocking due east and west Finally the old man spoke up "Listen, Zeke, don't rock that-away," he said "Turn your chair round Rock with the grain and save your strength"—Paul P Brooks, MD, in Health News, December 22, 1947

THE OXYTOCIC USE OF METHERGINE IN THE THIRD STAGE OF LABOR

John E. Tritsch, M D , Edward Schneider, M D , and Edmund F Longworth, M.D , New York City

(From the Department of Obstetrics and Gynecology, Metropolitan Hospital)

IN AN effort to substantiate further our ex periences in a preliminary series previously reported by us, we are presenting at this time 711 additional cases in which the new ergonovinelike substance, known as methylergonovine,* has been used

The partial synthesis of an ergot alkaloid has been successful for the first time and has made it possible to produce a large series of isomers and homologues of ergonovine. These have been subjected to accurate pharmacologic analysis and it was found that great differences exist in their effect on the uterus of animals

Among the most powerful of these partially synthetic substances, methylergonovine (Methergine) stands out particularly In comparison with the natural ergonovine, its effect is somewhat stronger and more prolonged in laboratory animals. It also was shown to be the most potent among fifteen derivatives which were subjected to pharmacologic examination in the rabbit uterus.

Third Stage Technic

In our preliminary series of 200 cases, 101 were tiven 1 ce, of Methergine containing 0.2 mg, per cubic continued in the control of the placenta. In the other 99 cases, the same preparation and does were given intravenously immediately following birth of the child and before the placenta was delivered. In both groups, the blood loss was measured for thirty minutes after delivery of the placents.

In the cases handled by the intramuscular method, a modified Credé maneuver was used to deliver the placents. In the cases handled by the intravenous method, the placenta was delivered by the Brandt maneuver?

In all cases, the blood loss was measured accurately in the following manner. A sterile metal parawas placed beneath the patient set buttoeks. Extending from this pan was a trough emptying into a raduated container which was at all times under the direct vision of the accoucheur. This container was on a movable arm which could be maneuvered by the operator's knee in order to avoid inclusion of amniotic fluid and other possible dilluonts.

Clinically in this further study of the 711 cases, there were 209 primiparae and 442 multiparae The operative including elective low forceps in primigravidas was as follows

* Methergine was supplied by the Sandos Chemical Works. Inc., New York City

Primigravidas Multigravidas	New Series 136 23	Old Series 15 5	Total 151 25	Percentage of Total 50 50 5 47
Total Series			179	23 07

The average blood less in this series of 711 cases, in which the drug was administered intravenously immediately after the birth of the infant, was as follows

	Primiparae	Multiparae	
Operative	190 55 co.	142 64 cc.	
Nonoperative	101 02 cc.	93 41 ca.	

It is interesting to note the incidence of blood loss over 500 cc. in this series. The preliminary series of 200 cases had 5 cases or an incidence of 2.5 per cent. The present series has 10 cases or an incidence of 2.68 per cent, or a total of 2.4 cases in both groups for an incidence of 2.65 per cent.

The average blood loss in each series was as follows In the group of 101 cases receiving Mether gine intramuscularly the average blood loss was 183.07 cc. (gross) In the first series of 99 cases receiving Methergine intravenously, the blood loss was 113.24 cc. (gross) In this series of 711 cases in which Methergine was given intravenously the average blood less was 116 17 cc. (gross)

The blood lose calculated on a percentage basis in 100's of cc. is presented in Table 1. A number of interesting observations can be made from this table. For example, 617 per cent of the patients who had Methergine by the intravenous route at the delivery of the baby and before delivery of the placenta lost less than 100 cc. of blood, whereas, in those where Methergine was given after delivery of the placenta, only 31 6 per cent lost less than 100 cc. There were 21 cases out of 810 (intravenous route) and 3 cases out of 810 (intravenous route) and 3 cases out of 101 (intramesular route) in which the postportum bemorrhage was over 500 cc. The highest blood loss in any case was 2,050 cc. There were no fatallities in this series.

TABLE 1.—Calculation of Blood Loss on Percentage Basis

Blood Loss	Intravano Number of Cases	us (810) Percent- age of Total	Intramuse Number of Cases	Percent-
0-100 ec. 101 200 ec. 201-300 ec.	498 178	01 7 21 9 8 3	32 38 15	31 6 37 6 14 8
301-400 cc. 401 500 cc. 501 cc. and over	66 32 17 21	8 9 2 1 2 6	5 5	7 8 4 8

It may also be interesting to note the effect of general anothesia upon blood loss. In Table 2, the cases are divided into two categories, those which received general anothesia and those which did not. Original Series

TABLE 2—Supplemental Data on the Effect of General Anesthesia on Postpartum Hemorrhage

	General No General	
	General Anesthesia	No General Anesthesia
Primiparae	130 55 cc	71 63 cc
Multiparae All Patients	143 33 cc. 131 65 cc	92 13 cc 88 32 cc.

The latter included local, caudal, pudendal block, etc. as well as patients who received no anesthesia either because of precipitated delivery or some other It is clear that general anesthesia increases by about 50 cc the average blood loss

Average Length of Third Stage-Minutes 7 68 (intravenous group) 10 38 (intramuscular group) Original Series

6 91 7 01 (intravenous group only) New Series Total Series There were no constitutional or local reactions in any of the cases However, manual removal of the placenta was necessary in 4 cases of the final series

and 3 cases of the preliminary series, for a total of 7 cases and a percentage of 0 86 per cent Davin and Morris, using ergonovine (Basergin) with the same technic, state "In the entire series

of 1,600 cases, retained placentae requiring manual removal occurred in 20 cases, an incidence of 1 2 per cent "3

According to Monrad E Asberg and Duncan E Reid (Harvard University), manual removal of a retained placenta following delivery of a viable infant was performed 217 times at Boston Lying-in Hospital from 1929 to 1943 During that period, 45,602 patients were delivered of viable infants Thus, manual removal was performed once in every

210 deliveries (0 47 per cent) Indications were hemorrhage per se and retention with hemorrhage "Use of oxytocic drugs These authors further state following delivery did not appear to be significant in retention of the placenta"

Comments

- After further clinical experience with 711 additional cases, plus the 200 previously presented, we find Methergine nontoxic
- The drug seemed definitely to reduce postpartum blood loss as compared to most available statistics
- 3 The administration by intravenous route accelerated the delivery of the placenta by about 31/2 minutes on the average and further reduced blood loss
- Incarceration of the placenta occurred in 0 86 per cent cases, all easily removed

Conclusions

We continue to be of the opinion, after a trial in 911 cases, that Methergine is an efficient and a nontoxic ovytocic drug

ATOMIC ENERGY EXHIBIT AT MUSEUM

A comprehensive exhibit on atomic energy, the largest of its kind in the country, is now on display at the American Museum of Natural History, Central Park West at 77th Street, New York City, where it opened January 21 and will continue for two months through April 5 The exhibit is sponsored by the Brookhaven National Laboratory, nuclear research center for the Northeast, under the auspices of the US Atomic Energy Commission

Installed in Education Hall of the Museum, the exhibit is open to the public during regular Museum hours, which are on weekdays and Saturdays, from 10 AM. to 5 PM, and on Sundays, from 1 to 5 PM Special group tours of the exhibit may be arranged by organizations, by request to the Museum The exhibit includes a demonstration of nuclear

fission as it occurs in an atomic pile, with striking visual and sound effects caused by the actual breakup of uranium atoms A radium-beryllium source valued at \$10,000 is the neutron source in the "model atomic pile" The model was conceived by Dr John R. Dunning, scientific director of Columbia

Beneficial applications of nuclear energy are suggested by exhibits such as an "atomic power plant, which shows by special lighting effects how an atomic pile may be adapted to provide heat energy to drive electric turbo-generators An animated "pin ball" panel shows the breakup of U-235 atoms in a chain reaction

"Mr Atom," a large silhouette, demonstrates how a radioactive substance may be introduced into the human system to guide doctors in the diagnosis and treatment of ills Other demonstrations show further uses of these radioactive "tracers," and include the special instruments which are used to follow the course of radioisotopes used in biologic, chemical, and medical investigations

INTRACUTANEOUS INFLUENZA VACCINATION

HERMANN VOLLMER, M.D., New York City

THE value of immunication with inactivated influenza virus vaccine has been well established for adults.1-3 Similar data for children are lacking. We do not know the proper age nor the optimum desage for immunication, nor are we informed about the duration of an effective immunity We do know, however, that the procedure requires repeated injections and that the resulting reactions are quite discouraging The mjection is painful, and severe general reactions ensue in a great percentage of cases. Even generalized convulsions have been observed 4

An attempt was made first to find a method which avoided such untoward reactions and was more acceptable for the unmunication of children Absence of general reactions and satisfactory immunologie responses have been reported in the past following the intracutaneous administration of typhoid vaccine 1-11 diphtheria toxoid,12-14 and scarlet fever toxin,13-14 Smaller amounts of antigen injected intracutaneously seemed to produce the same degree of immunity as larger subcutaneous doses of the same substances. A clinical trial of intracutaneous influ enra vaccination therefore suggested itself

One hundred and twenty three children between the ages of 2 and 16 years received a single intracutaneous injection of 0.1 cc of influensa virus vaccine, type A and B, prepared by centrifugation from the extra-embryonic fluid of the chick embryo and formalin killed . The vaccine was injected into the extensor surface of the forearm None of the children had a history of egg allergy

The intracutaneous injection was followed in every case by an immediate burning pain lasting for about one minute. No one complained of pain at any later period Within five minutes after the injection, an erythema of 2 to 8 cm in diameter developed, followed by induration which gradually disappeared within two to five days. While this local reaction faded, slight Itching was noticed by about 10 per cent of the children. A moderate swelling and tenderness of the regional lymph nodes occurred in 21 children. Only 3 children developed a tempera ture up to 100.5 F within twenty four hours following and probably due to the immunization

This intracutaneous method of influenza *Supplied through the courtesy of Dr. H. D. Pierama, Lederle Laboratories Pearl River New York.

immunization is relatively free from disagreeable Whether it gives adequate protection could not be determined. While this study was being completed, a report of van Gelder, Greenspan, and Dufresne appeared, comparing the effects of subcutaneous and intracutaneous in fluenza vaccination 10 The antibody titers were determined by a modification of the Hirst red cell agglutination inhibition test in large groups of Navy personnel.20 These authors found that following a single intracutaneous dose of 0.1 cc of influenza virus vaccine a considerable rise in the serum antibody titer occurred rapidly, reaching a level in one month of several times that obtained by a single dose of 10 cc of the same vaccine administered subcutaneously

Conclusions

A single intracutaneous injection of 0.1 cc. of influenza virus vaccine in 123 children was not followed by disagreeable local or general reactions which occur frequently after the subcutaneous injection of larger doses of this agent.

According to van Gelder, Greenspan, and Du fresne, this intracutaneous immunization produces higher serum antibody titers than the subcutaneous administration of 10 cc. of the same vaccine

A clinical trial of this method appears desirable

PEDIATRIC APPROACH TO THE MANAGEMENT OF ALLERGIC ECZEMA IN CHILDREN

BRET RATNER, M D, New York

(From the Department of Pediatrics, New York University College of Medicine)

MANY of the papers on eczema have left out of consideration the needs of the pediatrician who first sees these cases. It is he who must make the diagnosis and give some relief for this malady, which is a trying experience both for the affected child and its parents. I shall not attempt to cover the subject fully, but rather to emphasize some of the salient features in an effort to orient the pediatrician and to offer some suggestions for the immediate management of this condition.

General Considerations

A typical infantile eczema usually presents an erythematous and oozing appearance and may involve the face and scattered areas on the body and extremities. The condition is highly pruritic, and evidence of bleeding scratch marks are the rule. At times it may be localized, but in other instances it may be so widespread as to affect practically the entire body. Many infantile eczemas clear up before the end of the second year without any recurrence. However, the dermal manifestations may be succeeded by asthma, a respiratory expression of allergy.

Eczema may persist in recurrent episodes throughout childhood and even into adult life, either in conjunction with asthma, or as a dermal allergic entity This chronic form of eczema, which is best designated as allergic disseminated neurodermatitis, and is perhaps the most difficult form of eczema to eradicate, tends to become localized in the neck, the flexures of arms and legs, and the dorsa of the hands assume chronic characteristics in the form of papules, fissures, excorations, lichemfication, and dark grayish plaques The lesions are very pruntic, and the skin shows the evidences of scratching Positive allergic skin tests are the rule, and the causative substances are multiple Psychogenic disturbances are present in most

Secondary bacterial infection is often present, but mycotic involvement, although present at times, is not the rule. It is important to appraise

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on Pediatrics, May 8 1947

the character of the lesions carefully to determine whether there is a superimposed infectious derma-Even when the dermatitis is allergic, one should bear in mind the possibility of concurrent skin infections such as impetigo, trichophytosis, epidermophytosis, pyogenic infection, scabies, pityriasis, dermatitis venenata, dermatitis resulting from overtreatment with medicaments, e.g., phenol, the mercurials, and other substances, and skin irritations due to mechanical factors Specific treatment must be instituted for their correction before the allergic phase is tackled A case comes readily to mind of a young infant who was recently sent to me for the treatment of a diffuse infantile eczema The condition gave all the appearance of allergic dermatitis, but careful study proved it to be a widespread case of scabies It was gratifying to discover later that the young father, who had recently returned from the war, had scabies, and that the mother as well as other members of the family acquired it anti-scabetic therapy resulted in a marked recession and gradual clearing of the skin. Had laborious allergic studies been attempted, they would have proved futile

While one may have to admit that a greater susceptibility to allergy does exist in certain children born of highly allergic families, it does not appear that the actual age of onset of eczema is greatly influenced by genetic factors fants under one year of age we found that eczema was the presenting syndrome in 90 per cent of the The average age of onset of eczema in infants under a year was one and nine-tenths months, and the average age at the time of observation was six and five-tenths months further of interest to note that of all the allergic syndromes, the period between the age of onset and the time that medical attention is sought is shortest for eczema In a study of 250 allergic children we found that 45 per cent suffered from eczema, whereas in the adult allergic antecedents of these patients the number of eczema cases was only about 10 per cent, showing that this disease is particularly related to childhood From these figures it is apparent that eczema is the prevailing allergic condition in infancy and that it starts considerably earlier than any other allergic syndrome

Positive allergic akin reactions were obtained in 85 per cent of the patients under one year of age While 100 per cent of these positive reactors were sensitive to foods, only 41 per cent reacted to foods alone, and 59 per cent reacted to a combination of foods, inhalants, and contactants

Much as been done to solve the riddle of eczema in infants and children since the advent of the allergy concept. Despite the large number of papers concerned with this problem, there is per haps more confused thinking here than in any other field of allergy. Much of the confusion anses from the use of the terms eczema and der matitis. Let, because of such extensive usage both terms will have to be retained, to be used interchangeably at times and at times specifically

One can use the term irritative dermatitis or contact dermatitis to signify a skin condition due to any irritant that will in given concentration and under given circumstances affect practically all human skins Thus, a nonallergic dermatitis can be caused in the normal skin by contact with a physical or chemical agent. Examples are the typical diaper rash seen in early infancy as a result of chemical irritation, or the dermatitis resulting from the mechanical rubbing of the child's clothing These are characterized by varying degrees of inflammation which may cause the destruction of the cutaneous layers and even the subjacent tissue The localization and relation to the causative factors make them readily recog nizable, and simple treatment by climination of the offending agents affords complete relief

With a dermatitis due to allergic sensitization, variously known as eczema, infantile eczema, atopic eczema, atopic dermatitis, allergic derma titis or disseminate neurodermatitis, contact dermatitis or contact eczema, the problem becomes particularly muddled, for one investigator or another has set up criteria sharply differentiating one from the other For example the following criteria have been set up for an atopic derma titis or atopic eczema (1) positive family history for allergy (2) specific reaguns (circulating antibodies) demonstrable by passive transfer (3) positive scratch or intracutaneous tests, (4) usu ally negative patch tests, and (5) the offending substances should be protein in nature other hand, cases suffering from contact derma titis are characterized by (1) a negative family history (2) absence of circulating antibodies, (3) absence of positive intracutaneous reaction, (4) positive patch tests and (5) sensitivity to substances not necessarily protein in nature Hence, they would have us differentiate these two types of dermatitis, even though both are allergic in character and arise from an antigen-antibody cellular union

We shall not enter into the controversy which

has emanated from this differentiation. Rather, we shall state categorically that unless more con vincing proof can be offered in support of the thesis that contact dermatitis and atopic eczema do differ in their basic mechanism, we shall adhere to our opinion, held for many years, that they are both mediated by the same mechanism and should be designated as allergic dermatitis, to be studied and treated on the basis of antigen-antibody interactions. They differ only in the mode of sensitiantion, so-called atopic eczema usually resulting from intrinsic contact with antigens and contact dermatitis from extrinsic contact.

It is little wonder that it is difficult to engage the interest of the pediatrician in all the phases of The time must soon arrive, how this subject ever, when the salient facts, gleaned from the maze of work that is being carried on, will be formulated into broad principles that can be more readily applied in general everyday practice. The present paper is offered to the general pedia trician as a tentative working basis for the management of the allergic case of eczema he so frequently encounters. The problem is difficult, but the immediate treatment can be handled intelligently without elaborate allergy testing If the ecrema is to be firmly rooted out, however, after the skin is cleared, the child should be studied intensively to determine the exact offend ing substances not only to eradicate the eczema but also to prevent asthma from developing

Management

The following are the procedures which I use preliminary to skin testing to clear the skin.

Food -All eczema cases are immediately placed on an allergenically denatured diet fitting the needs of the patient. These denatured foods, in which the albumin and globulin fractions have been coagulated by moist heat are as follows evaporated milk, pablum, pabena, thoroughly cooked cereals thoroughly cooked vegetables thoroughly boiled meats, hard-boiled eggs and stewed fruits. In addition, the following foods are eliminated raw fruits fish, nuts condiments chocolate, as well as the raw or lightly cooked forms of the permitted foods diet is essential to reduce or negate the entrance of any native proteins into the blood stream via the intestinal wall. Ascorbic acid is prescribed to satisfy the vitamin C needs

A careful history may help to relate the onset of the eczema to the ingestion of a new food. If the food is one in which the mother overindulged during the latter months of pregnancy the infant may have been sensitized in utero. Particular questioning should be directed to excessive indulgence in eggs, and egg-containing foods, milk, wheat fish nuts, candles, fruit and vegetables.

Sensitization to foods may also take place via the breast milk Occasional feedings of raw milk during the neonatal period, raw foods taken during convalescence from disease, overfeeding, the too early introduction of solid foods, excessive indulgence in seasonal or bizarre foods, may all help to explain sensitization Questions along these lines may point to the incriminating food

Environment -Animals should be removed

All dust producing articles should be eliminated as far as possible, including stuffed toys. All pillows and mattresses that are retained should be covered with some impervious material, e.g., down-proof Egyptian cotton. The rubberized materials available on the market have a tendency to produce sweating, and in addition are very expensive. Fuzzy woolen garments, rough materials in general, and pure silk should be eliminated. Garments should be made of soft cotton materials.

Medication —Local medication must be aimed at healing the damaged skin and relieving the itching. The following are a few of the remedies I use, but ingenuity must be exercised in the choice and application in the individual case

(A) For secondarily infected wet, oozing skin I have found a 2 to 4 per cent aequeous solution of gentian violet an excellent compound. It should be used freely and frequently and can be aided in its drying affect by applying calamine lotion over it. Its healing properties are good, and at times it proves the most gratifying compound.

Calamine lotion, in single or double concentration, with phenol up to 3 per cent, or without it, may be used for every case as an adjuvant, aiding in drying the wet areas and in the relief of itching

Lotio alba is also of value when a thin application is desirable. An equal mixture of lotio alba and calamine lotion makes an excellent preparation, particularly for the face and intertrigenous parts, for erythema and sudamina

Wet dressings advocated by many dermatologists are not of as much value in infants and children as in adults. They may lead to unnecessary chilling of the body. The difficulty of applying them must also be considered.

(B) Ointments are useful for the healing of the irritated and dry crusted forms of eczema. For the most part, it is not necessary to use proprietary ointments. With a little application of thought the physician can devise appropriate medication for the particular dermatitis. If one consults the United States Dispensatory, he will find practically every ointment in common use and by a proper utilization of this information ointments can be created to fit the needs of the individual patient.

For example, phenol (1 to 3 per cent), valued because it allays itching, and crude tar (1 to 3 per cent), for its healing properties, are important ingredients in most ointments devised for the treatment of eczema

The basic ointments are zinc oxide (Ung Zinc Oxid) and rose water (Ung Aq Ros) Now, if one wishes to add a softening agent, one can use white ointment (Ung Alb) which contains lanolin, or one can use Aquaphor Ointment of coal tar (Ung Pic Carbon) or compound ointment of tar (Ung Pic Co) may also be prescribed

If the skin is impetiginous, or infected, ammoniated mercury ointment (Ung Hydrarg Ammon) should be prescribed

If the skin appears to be trichophytotic, or infected, one can prescribe Whitfield's ointment, ointment of benzoic and salicylic acid (Ung Acid Benz et Salicyl)

If one is dealing with a scabetic or other parasitic involvement, sulfur ointment (Ung Sulfur) is indicated

Another excellent preparation is ichthyol ointment (Ung Ichtham)

Instead of commercial cold cream, one can use rose water ointment (Ung Aq Ros) which has a cooling effect

Vanishing cream, which contains sodium stearate, is excellent because it is greaseless, and it is gaining in popularity as a base for compounding various ointments

Because of the toxicity of boric acid it is best not to use boric acid wet dressings or boric acid ointment for young infants

Various combinations of these standard pharmacopoeial ointments may be prescribed to fit the needs of the particular child's skin. The pharmacist has little difficulty in compounding them, and the obvious advantage is the small dosage of the individual ingredients when prescribed in such varied combinations.

If large areas are to be covered, it may be advisable to prescribe the basic ointments individually—that is ichthyol ointment, zinc oxide ointment, sulfur ointment, etc., as such—and the nurse or parent can experiment with them in equal or varying proportions (mixing with the aid of a tongue depressor) to discover what combination is most healing

These suggestions will take care of the majority of skin lesions

While the child is being treated with ointments, the body should be completely covered. At times complete restraint may be essential, the hands and legs being secured to the crib slats. In my experience I have not found that bathing with a bland soap and water is contraindicated. A soapless agent, such as Acidolate, may be of

value The removal of dried crusts is often admirably affected by the free use of hydrogen perovide and sterile cotton

Sedatives of greatest value are phenobarbital in small doees, e.g., 1/4 grain, and acctyl salicylic acid in 3 to 5 grain doees. A combination of both is often most effective.

If the child has a real retardation in bone age as determined by x ray of the wrists, the administration of thyroid in judicious quantity is indicated.

Unsaturated fatty acids, found particularly in lard, soybean and inseed oils have been advocated by some workers. Whether these are proved mentorious agents or not no harm can come from their addition to the diet, and some good may accrue. They should be used in con junction with the allergenically denatured diet.

Under no circumstance should an eczema case be vaccinated against smallpox, because a serious

or fatal consequence may result

The question about antibiotics will undoubtedly be raised. It is hazardous to use sulfona mides, penicillin, streptomycin and tyrothricin continents for the reason that in infantile eczema absorption may result in sensitization numerable cases have already been reported of marked skin sensitization, resulting from the use of one or other of these substances, with serious and at times a dangerous outcome. However, in a severe case of secondary infection these antiblotics should be used as they are in all severe infections, and they should be used intensively They should be given preferably by mouth or inlection. This does not condone the general Adminupromiscuous use so prevalent today tration in the absence of infection should be frowned upon

The so-called antihistamine drugs benadryl

pyribanzamina, and so on, while they do allay itching to some extent, do not control the itching of a severo case. They should be used circumspectly if they are employed and prescribed to be taken at night because of the marked effect of drowsiness which they produce in some cases, or of cerebral etimulation in other instances. As an adjuvant they are permissible. They do not in any sense correct the external

Conclusions

1 Infantile or childhood eczemas, as defined herein, whether they are initiated by intrinsic or extrinsic factors are viewed as an allergic dermatitis.

2 Of all the allergic syndromes, the age of

onset is earliest for infantile eczema

3 Eczema may be self limited and clear spontaneously without any residual sensitivity

4 Many allergic dermatidities however, are

5 Persistent cases should be studied thor oughly from an allergic standpoint and specific anti-allergic preventive measures instituted

6 The early eczema is often a pediatric problem and the salient features of its management

are detailed

7 In the management of eexema the best results are obtained if the case is viewed from the standpoint of diet, environment, psychosomatic and constitutional phases in conjunction with local dermal therapy

8 The use of local antibiotic therapy is not

approved as a routine measure

9 The antihistamine drugs are pallintive and do not correct the underlying pathology of allergic dermatitis

50 East 78th Street

OFFER FELLOWSHIPS FOR PUBLIC HEALTH DEGREE

Fellowships leading to a master's degree in public health are again being offered to any qualified United States citizen between the ages of 22 and 40 according to a statement released January 16 by the United States Public Health Service Federal Security Agency Funds are available through a grant from the National Foundation for Infantile Paralysis.

Candidates must hold a bachelor's degree from a recognized college or university at the time the application is filed, and must be able to meet the entrance

requirements of the accredited school of public health of their choice Proof of acceptance at such a school must be furnished before applications are submitted to the Pellowship Awards Committee for consideration.

In addition to the back-lor's degree courses in the biological sciences, sociology and education are required Training in public speaking, journalism, psychology and work in public health or a rolated field is considered desurable

AN IMPROVED DEVICE FOR EXTENSIVE ECG EXPLORATION OF THE CHEST

H R MILLER, M D, New York City

(From the Medical Service of the Montefiore Hospital, New York City)

THE use of multiple precordial leads is well Lestablished The number of placements is limited, as a rule, to 6, the electrodes $(V_1 \text{ to } V_6)$ are affixed to the anterior chest wall at the level of the fourth intercostal space and extend to the left midaxillary line 1 A switchbox has been utilized to facilitate taking these leads 2 Groedel explored the entire chest,3-5 Kisch and Richman employed 6 to 8 electrodes on each side of the chest and a central electrode over the midsternum 6 The value of placing electrodes high in the left axillary territory when lateral wall infarction is suspected was stressed by Wilson and his coworkers 7 Complete systematic ECG examination of the entire chest topography was still, however, an uncommon practice, chiefly because of technical difficulties The following device and procedure were developed to overcome these difficulties

- 1 A rubber harness is constructed of 4 horizontal rubber belts ($2.5 \times 100 \times 0.2$ cm) fastened by metal collar buttons to several vertical rubber strips ($2.5 \times 15 \times 0.2$ cm) The horizontal belts are held 1.5 cm and the vertical strips 8 cm apart. All rubber parts have perforations 2 mm in diameter and 9 mm apart. A small metal hook is attached to one end of each horizontal belt. Shoulder straps of the same rubber strips may be employed
- 2 Electrodes are made of brass with a flat disk 2×0.1 cm and a shaft 2 to 2.5×0.6 cm
- 3 Sponge rubber is trimmed to segments $2 \times 1.5 \times 1.5$ cm
- 4~ A switchbox, or several if required, $20~\times~30~\times~35~$ cm , has selector switches with dials on the upper panel, rows of sockets in the front panel for 80 chest leads, and 1 or 2 sockets for wires to the ECG machine
- 5 Connections are of insulated multiple strand copper wire, approximately 12 gage Each wire is 120 cm long with a banana plug soldered to one end and a small Mueller bulldog grasping clamp at the other end

The apparatus is assembled by inserting 20 electrodes in each of the 4 horizontal belts Around each circular chest level, the designated electrodes are placed as follows #1 lies over the midsternum, #6 over the left midsxillary line, #11 over the spine, #16 over the right midsxillary line Interposed between #1 and #6, #6 and #11, #11 and #16, #16 and #1 are 4 equidis-

tantly spaced electrodes Irregularities of chest contour are filled in at all levels by affixing a segment of sponge rubber to the shafts of electrodes #20, #1, #2, in contact, respectively, with right sternal border, midsternum, and left sternal border, and electrodes #12, #11, and #10, in contact, respectively, with right paravertebral, vertebral, and left paravertebral areas The shafts of these electrodes are pushed through perforations in the belts, the sponge rubber filling the space between electrode disk and rubber belt. The banana plugs, suitably numbered, are inserted into the correspondingly numbered sockets of the switchbox.

Procedure

The patient is seated on a round stool and the harness, mounted with 80 electrodes, secured around the chest The metal hook of each horizontal rubber belt is fastened to a perforation in the same belt at a point close to the right midaxillary line The electrode, sixth in series from the metal hook, lies over the midsternum and is designated #1, the successive electrodes are numbered 2 to 20 in rotation paste is delivered by a 10 cc glass syringe to the The Mueller undersurface of each electrode clamp of each numbered wire is attached to the shaft of a correspondingly numbered electrode The ECG machine is adjusted to standard lead 3 The cable of the left leg electrode is connected to the switchbox, and the cable of the left arm electrode to the left leg A record of 2 to 3 heartbeats is taken in rapid succession with each electrode The instomatic device of the standard ECG machine will enable the operator to secure 80 records in ten to fifteen minutes, covering 4 circumferential levels of the chest, thus providing a consecutive ECG record of the entire spherical cardiac surface A fifth series of electrodes may be applied at the ensiform level

About 100 cases were studied with this procedure. Fifty patients whose ages ranged from sixteen to sixty-two were normal, the rest were patients with hypertensive cardiovascular disease, rheumatic heart disease, and myocardial disease associated with arteriosclerotic changes.

Results

All the complexes in the normal subjects with vertical hearts, showing right axis deviation, were

Fig. 1. Rear view of rubber harness with electrodes in place and connected to 2 selector switchboxes, each accommodating 40 connections (a angle switchbox for 80 connections may be employed instead)

Upper right a single electrode with and without segment of rubber sponge.

Upper left side view of harness showing metal hooks.

apt to be inverted in all or most placements at circumferential level 1 and often at level 2 as well. The records resembled those taken with VR or esophageal leads. In advanced mitral disease with right axis deviation the ECG pleture was practically identical at levels 1 and 2 but at levels 3 and 4 the full inscription of the left ventricle made its first appearance as late as placement 8 or 10 or not at all. The record was dominated by QS, R appearing if at all, at the right axilla and right chest.

Normal subjects, many of whom had semi transverse or horizontal hearts, and most subjects with right axis deviation disclosed the following T pattern at levels 3 and 4 T was upright, but the voltage steadily declined from about placements 1 to 10 then T became negative, the voltage steadily rising from placements 11 to 20.

This was observed with CF but not with CR leads.

In contrast all 4 circumferential levels in left axis deviation with left ventricular hypertrophy associated with hypertension disclosed an opposite picture. The was negative in placements 1 to 10 approximately and became upright from 11 to 20. This was observed not only with CF but with CR, CL, and CW leads. Hypertensive cases unaccompanied by left ventricular hypertrophy showed the T pattern observed in the normal group.

Discussion

Records taken from right to left on the anterior chest often reveal a small R which enlarges across the transition zone i.e., the area in which the potentials of both ventricles are mixed. As the left side of the chest is approached, a full R is likely to appear, this is the insigne of the left Sometimes the R remains small or absent over the right side of the chest and across the transition zone as well, the left ventricle appearing suddenly, well on the left side tinuing around the back, the R wave of the left ventricle steadily dwindles and Q or QS may dominate the picture

It might be argued that since the R produced by the right ventricle is small in most cases, it follows that the mass of the right ventricle does not develop enough electromotive force to cause a The right ventricle, however, good-sized R should be expected to produce an effective R, because, although the thickness of the chamber seldom surpasses that of the left ventricle, it is, nevertheless, fairly thick. As a matter of fact, the R is of good size in about 25 to 30 per cent of cases in which the right ventricle is normal or It is also of good size in right hypertrophied bundle branch block where the impulse, arriving at the unblocked left ventricle, touches off this chamber, the impulse then reaches the right ventricle from which a very effective R wave arises, since this chamber remained unaffected by the potentials of the left ventricle

The R wave obtained in the cavity of the right ventricle, on the other hand, is often small 8 We may, therefore, infer that the R wave is already small before the right ventricular mass gets

into action and that the smallness of this wave is not a reflection of a small amount of electromotive force developed by the ventricular mass The wave is small because its excursion is cut short by the powerful potential of the left ven-The negative deflection (QS complex), often observed in such circumstances, is due to the potential of the left ventricle travelling away from the precordial electrode

Conclusion

- 1 A simplified, efficient device and technic have been developed for securing 80 or more chest lead
- 2 ECG findings obtained by this method have been briefly discussed

PLAN PROGRAM FOR LEPROSY RESEARCH

The Advisory Medical Board of the Leonard Wood Memorial and a group of consulting chemotherapists, nominated by the chairman of the medical division of the National Research Council, recently met in New York City, for the purpose of planning a program for extensive research to find improved drugs or methods for treating leprosy

This meeting was probably the first at which a large group of distinguished scientists, most of whom were not leprologists, has met to consider this health problem from the strictly scientific viewpoint

There was general approval of two plans One is to establish a cooperative scheme with selected workers in various countries, under a central coordinating committee, whereby the new drugs now in use may be evaluated scientifically, by uniform methods of procedure and recording. Another is to establish, in connection with some suitable leprosy institution, a testing unit with special personnel to make preliminary tests of new drugs which appear to be of promise, but which have not yet been used in the treatment of leprosy

HIATUS HERNIA CONFUSED WITH CORONARY THROMBOSIS

GEORGE C LINN MD FACP, New York City

(From the Morrisania Hospital)

THERE are many patients whose chief com-plaint is pain in the left chest. The cause is often considered to be coronary insufficiency with myocardial damage If an electrocardiogram is done and evidence of myocardial damage is found, the patient is condemned as a cardiac case, and no further search for the cause of pain is made. At times the diagnosis of coronary throm bods is adhered to despite the lack of confirming evidence. Because of the serious prognostic im plication in the diagnosis of angina pectoris or coronary thrombosis, it is essential to emphasize one of the sources of diagnostic errors, namely histus or diaphragmatic hernia. It has often been demonstrated that gastrointestinal disease may amulate cardiac ailments. Wakefield in discussing gallbladder discase as related to cardiac disease, mentions a sixty year-old white woman, who gave a perfect history of acute coronary thrombosis, but because of the lack of confirmatory evidence gallbladder and gastrointestinal x ray series were done and revealed an esophageal hiatus hernin.1 One must remember, however that heatus herma and coronary occlu sion may coexist Widmer states that herma of the abdominal contents into the thorax may take place through any natural opening in the diaphragm which has weakened or dilated ' He further states that sixty per cent of these are through the esophageal opening

There is a definite anatomic and physiologic relationship between the cardiovascular and gastrointestunal systems. Both are innervated by the sympathetic and parasympathetic nervous systems and are subject to reflexes in either of these systems. According to Head's work, pain from the heart is referred to the third and fifth cervical segments, and the seventh and eighth dorsal segments, predominantly on the left side but sometimes bilaterally: Pain from the stomach is referred to the seventh, eighth, and amth dorsal segments, bilaterally This explains why pain from either stomach or heart may be referred to the substernal and epigastric areas and to the neck and left clavicular regions. Pain due to disturbance in the diaphragm heart esophagus, and stomach, is carried over the Visceral afferent nerves, and results in so-called viscerocutaneous or referred, pain. ments involved are the ones described above. However, the stimuli may be spread to several levels above and below the original levels of **s**timulation

- direct011

The painful stimuli in hiatus hornia may be due to irritation of the hernia wall itself or to that of the marginal portion of the histus in the dia nbraem There may even be some painful stimuli referred from the terminal end of the esophagus. Not only may irritation of these three areas cause pain, but they may also cause various arrhythmias. If the work of such observers as Gilbert, Fenn, LeRoy, and Green is to be accepted, irritation or distention of the areas mentioned may even cause a reflex vasoconstruction of the coronary arteries 7 This is supposed to occur as a result of a reflex, set up by the stimula tion of the vagus nerves in the stomach and esophagus.

Many patients with diaphragmatic hernias frequently go through life without being aware that anything is amiss. Symptoms occur when a restricted portion of the stomach or other abdominal viscera are caught in one of the small openings in the diaphragm. The symptoms are more often related to the gastrointestinal tract with acute pain, vomiting, or dysphagia. Occasionally, the symptoms are referred to the cardiac region and are difficult to explain, unless the real cause is found Physical signs are rarely present, unless the part of the viscus herniated is large and contains air or fluid Most frequently, the diag nosis is made on suspicion and confirmed by x-ray study This is particularly true in a patient with cardiac pain but in whom there is no confirmatory evidence of myocardial disease such as lack of progressive changes in serial electrocardiograms. elevated sedimentation rate, leukocytosis, or temperature rise.

The patient a story may be typical of an acute coronary thrombods, including severe pain in the left chest sensation of choking and pressure and even radiation of pain to the left neck and shoul der areas. In addition to the above symptoms. the patient complains of a good deal of eructation and does not have the feeling of impending death Until the diagnosis of higtus hernia is established. the patients are treated as a case of coronary thrombosis However efforts to keep patients quiet and at bed rest are in vain. They claim that they are more comfortable in an erect position Ingestion of food makes them more uncomfortable if they eat or rest while in a horizontal or semi horizontal position Being up and around after a meal gives them more comfort particularly if they are able to belch. Within a short period of time I had the opportunity of seeing three

patients whose chief complaints were related to the chest and who were diagnosed as having myocardial disease due to coronary occlusion

Case Reports

Case 1 —H O, a forty-nine-year-old white man, was an electrical contractor On January 8, 1945, while installing some x-ray equipment, he was seized with an attack of pain, in the substernal area, which radiated to the neck and both arms He also complained of choking sensation and palpitation Associated with this there was a good deal of eructa-Blood pressure at this time was supposed to have been 100/70 An electrocardiogram revealed minimal changes, suggestive of myocardial damage (Fig 1) The patient was told that he probably had a coronary thrombosis and was advised to go to bed On January 28, the electrocardiogram was repeated, and it was thought to show some prolongation of the QRS in L₂ However, close study showed this to be well within the normal range

On February 27, 1945, I saw the patient for the first time With the previous history in mind, I accepted the diagnosis of coronary thrombosis and repeated the electrocardiogram which showed no further changes except for a few extrasystoles. Sedimentation rate was 9 mm in one hour White blood count was 7,900 with polymorphonuclears 68 per cent, lymphocytes 30 per cent, eosinophils 1 per cent, and monocytes 1 per cent Blood pressure was 138/80 I ordered the patient to bed, and the usual cardiac regime was instituted This consisted of a bland, low gas-forming diet, and medication containing papavarine hydrochloride, atropine sulfate, phenobarbital, and aminophyllin The patient seemed to improve somewhat

On April 9, 1945, the patient again complained of severe epigastric and substernal pain radiating to the neck and arms, choking, and palpitation Blood pressure was 130/78 An electrocardiogram repeated at this time showed no change Sedimentation rate was again 9 mm in one hour patient was still treated as a possible case of coronary thrombosis, despite the fact that during all this time there was no temperature rise, and the blood pressure varied from 138/78 to 146/92 The outstanding complaint between attacks of pain was eructation, and the patient claimed that he felt better in an upright position, having at times gotten out of the bed against orders, because he felt better when up and around An electrocardiogram on May 5, 1945, still failed to show any evidence of progressive myocardial changes At this time, I felt that another cause for his complaints should be sought and advised gallbladder and gastrointestinal studies with the possibility of hiatus hernia in mind The gallbladder series was negative, and the gastrointestinal series was reported as negative, except for a redundant large bowel The patient was continued on a bland, low gas-forming diet with antispasmotics (bellandonal), but he still complained of vague epigastric pain and belching On May 21, 1945, the gastrointestinal series was repeated and this time revealed a hiatus hernia (Fig. 1)

Frg 1

then, this patient has been reassured that there is no evidence of coronary thrombosis and has been kept on similar diet and medication. He has been instructed not to eat large meals, nor drink fluids with his meals. When he adheres to this regime, he feels comfortable, and there are no further episodes of severe substernal pain.

Case 2 -A physician, H L, in 1937, at the age of thirty, while serving his residency, experienced a severe attack of epigastric and substernal pain, with a desire to belch but could not Neither alkalı nor food gave relief The patient passed a stomach tube himself, which resulted in expulsion of gas and fluid material and gave him complete relief for one year In 1938, he began to have attacks of precordial pain, related to walking and radiating down to the biceps areas of both arms These were typical of attacks of angina pectoris, and, if they occurred with activity, they were relieved by rest. Emotional excitement also caused these attacks In addition, he noticed that there was a good deal of eructation and that he felt better when he was up and around than when lying down These attacks subsided completely without any definite therapy

He was well until 1941, when, while driving his car, he developed in his left chest a very severe constricting pain which radiated to both arms. Associated with this was a marked desire to belch. He was sure that he had an attack of coronary occlusion.

but noted that there was no feeling of impending death. He drove home and was given morphine sulfate, 1/4 grain, which relieved him completely An electrocardiogram taken in the sitting position was negative This was repeated the next day and showed in inverted T: It was thought that he had had an acute coronary thrombosis and he was kept in bed for six weeks, despite the fact that he felt well showed no drop in blood pressure no temperature rise, a normal sedimentation rate, and normal white blood count. At the end of six weeks the only change in the electrocardiogram was reversion of the Ti wave to upright. During his six weeks in bed he was greatly troubled by the feeling of distention and cructation. At the end of the six week period he felt so well that he resumed full physical activities returning to a full and active medical practice.

He remained well until August 1944 when he again began having similar attacks of angina pectors. Associated with his chest pains, there was marked belching, and the feeling of abdominal distention. Because of his previous episodes another cause for his symptoms was sought Gallbladder eries was negative. An electrocardiogram (Fig 2) done in August, 1944 in the upright position showed flat T in L-1 low voltage of the QS complex in L-2 and an inverted QRS and T in L-4 There was also an apparent left axis deviation and strain mentation rate was 11 mm, in one hour blood count was 7 900 with a normal differential These remained the same from then until the present. At no time was there a rise in temperature X-rays of his chest showed that the left dome of his disphragm was as high as the right, causing an apparent enlargement in the transverse diameter of Serial electrocardiograms showed no further changes, except that the once taken in the borizontal positions showed an inverted T₁ (Fig. 2) while those taken in a sitting position showed a low to isoelectric Tr

At this time it was felt that the patient did not have a coronary occlusion because of the marked eruciation and relief in the upright position A hiatas herma was suspected and confirmed by gastrointestinal x-ray studies (Fig. 3)

It is interesting to note that when he had an

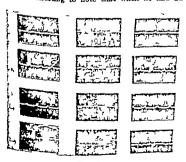

Fig 2.

Tro 3

attack of severe chest pain there was distention of the upper abdomen and protrusion of the left anterior chest wall. There was loss of hair over this area, which may have been caused by increased pressure on the inner surface of the anterior chest wall. interfering with the intercostal vessels and nerves which supply the nutrition to that area. The electrographic changes which simulated that of an terior wall damage may be due to the tamponade action of hernia, causing the anterior surface of the heart to press against the anterior chest wall with actual damage to the myocardium from this pressure. Or the changes may be due to torsion and rotation of the heart. The electrocardiographic changes might also be explained by the vasoconstriction reflex, via the vagus nerve resulting in coronary ischemia, as previously described

On a regime similar to that of the first patient plus changing of the intestinal flora by the addition of acidophilous milk and milk sugar to the diet, the patient is leading an unrestricted professional and social life

Case 3—Y F a sixty-nine-year-old white woman was admitted to Morrisania City Hospita in March 1946 because of rheumatoid arthritis and vague obdominal complaints. While in the ward, she developed an attack of severe constructing pain in the left chest, radiating to the neck and left arm. Along with this there was a great deal of cructation and the patient stated that she felt better in an upright position

An electrocardiogram was negative. At this time

Fig 4.

the case was diagnosed as coronary occlusion However, because of lack of confirmatory electrocardiographic findings and a normal sedimentation rate, and normal white blood count, gallbladder and gastrointestinal x-ray studies were made to seek another cause for her chest pain Gastrointestinal series in April, 1946, revealed a small hiatus hernia (Fig 4)

Summary

Three cases of hiatus hernia, which were originally diagnosed as coronary thrombosis, are presented to demonstrate that histus herma may mimic angina pectoris and coronary thrombosis It is because of the serious prognostic outlook in the diagnosis of coronary thrombosis or angina pectons, that the true cause for chest pain must be ascertained The diagnosis of histus herma can be confirmed with comparative ease, once it is suspected

An attempt is made to explain the cause of pain in hiatus hernia similar to that of coronary The pain of thrombosis or angina pectoris hiatus hernia is probably initiated over the

visceral afferent fibers supplying the esophagus and cardiac portion of the stomach, or, over the sensory afferent fibers from the diaphragm, contained in the phrenic, or middle or lower thoracic nerves, and, thus, is referred to the same segments as cardiac pain. Thus, overdistention or irritation of the hermated portion of the stomach may be responsible for the production of the anginal or coronary type of pain

The second case reported is of special interest, because of the area denuded of hair and the changes in the electrocardiogram. An attempt to explain these changes has been made in the discussion of the case The varying T1 may be explained by torsion or by actual myocardial damage, caused by tamponade of the herma with pressure myocarditis or by the vasoconstriction Although the patient did not act as a true coronary thrombosis, there is always a possibility that it may have coexisted

When surgery is contra-indicated or refused, it may be worthwhile to attempt to allay gastric distention by changing the intestinal flora, thereby decreasing the amount of fermentation

It is important to remember that the anginalike pain of hiatus hernia is more apt to be associated with eating than with effort. The patient usually complains of a good deal of eructation and feels better when he is up and around It is important to bear in mind that when a patient has symptoms of angina pectoris and coronary thrombosis, but stresses the facts just mentioned and fails to show confirmatory evidence of coronary disease, other causes for his complaints must be sought, among these, hiatus hernia should always be considered

PUBLISH NEW MAGAZINE FOR DIABETICS

On December 12 a national magazine for diabetics and the general public was launched by the American Diabetes Association, which is publishing the new periodical, called A.D.A Forccast Its publication is made possible chiefly through a three-year grant by an interested family to the American Diabetes Association.

A D A Forecast will contain articles by authorities on diabetes, but presented in language suited to nonmedical readers, its contests will also include infor-mation on diet, inspirational articles, question and answer columns, and news of progress in the control The magazine will also disseminate of diabetes facts on prevention of diabetes.

UVEITIS OF UNDETERMINED ORIGIN, WITH CERTAIN ETIOLOGIC CONSIDERATIONS*

JAMES A. INCIARDI, M.D., F.A.C.S., Brooklyn, New York

HEREWITH is reported a case of uveitis which occurred under a somewhat unusual set of cir cumstances. The peculiar background not only made this case something of a medical emergency but also introduced problems regarding etlology and decision as to therapeutic approach

Case Report

F G., a 37 year-old white man, came to the office on May 9 1946, complaining that his left eye had been 'inflamed and irritated' for the preceding six months and that more recently there had been slight blurring of vision. This was his only seeing eye. The right eye had been struck by a snowball twenty fire years before. Vision was reduced considerably in this injured eye after the accident but five years ago it had blacked out altogether. The only other past history of possible significance is the fact that he had had a severe cold ten days before I first saw him.

Examination.—Tension was 25 mm (Schiotz) in a right eye and 13 mm. in the left. The right, or the right eye and 13 mm. in the left. noncenng, eye revealed a 15-degree divergence, a mature, cataractous, subluxated lens, an atrophic hm, and light perception only with poor projection in the left eye there were a moderate number of grayla-white, small, round, posterior corneal depoits, fairly uniformly distributed. Slight aqueous intro was present, and there were some dust-like depoits. posits on the anternor lens surface. Moderate-sixed opacities floated in the anterior vitreous, and the tundos showed changes of high myopia. A weak 20/40 was obtainable with—10 00 S - 2.50 C × 140

The patient was admitted to the Brooklyn Eye

and Ear Hospital for work-up to determine etiology

and for observation and treatment.

Several blood counts urinalyses, sedimentation tests, and blood chemistries were normal. General physical examination, urologic survey chest plate, payaca examination, urologic survey cases prace, and dental check, including x-rays, revealed no abnormality Arguitanation tests for brucellosis, Mantoux tests, Rahn, gonorrhea complement first tion tests protein sears, and stools were negative. Three different field studies of the left eye were within newest little and togeneous testings. within normal limits, and tonometric testings throughout the month of hospitalisation were the same as the original readings. To rule out sar-coidosis, radiologic studies of the hands and feet were made and albumin-globulin ratios determined These were normal. There was 3 plus involvement of the left antrum and a large amount of fluid pus was expressed from the left tonsil.

Because of the history of injury twenty five years previously, further deterioration in vision five years before additional of dislocated before admission, with the findings of dislocated cataractors less and an almost totally blind right ere the problems of lens protein sensitivity and sympathetic ophthalmia, though possibly far fetched, were also considered. The bones of the orbit were radiographically negative and no opaque foreign body was demonstrable. Skin tosts with bans protein stabilizations toring and uves pith the sympathetic stabilizations toring and uvest pig kens protein, staphylococcus toxin and uveal pig

ment were made These showed slightly positive reactions in twenty-four and forty-eight hours Eleven days after the skin tests a full thickness section of skin containing the area injected with uveal pigment was excised from the arm. By microscopic study of this section Dr J Arnold de Veer demon-

strated a slightly positive reaction.

Treatment—Penicillin was administered intra muscularly for the first two weeks. At the end of this time a tonsillectomy was performed and the left antrum opened The patient also was given six courses of intravenous typhoid therapy boiled milk intramuscularly salicylates by mouth, and atropine

and heat locally

Course -The first week in the hospital produced no noticeable change in the eye condition. In the second week the corneal deposits in the left eye increased in number. In the third week a few dustlike opacities were seen for the first time on the posterior cornes of the right eye. The deposits in the left eye did not increase and a few of them became slightly brownish in color There was no keratic precipitate increase in the fourth week and a greater number of the deposits in the left eye became brownish. By the time the patient was discharged from the hospital corrected vision in the left eye had improved from 20/40 to 20/30

Since the patient s discharge there has been a very ow but steady improvement. The dust-like opaci slow but steady improvement. ties in the right eye slowly disappeared. The deposits in the left eye gradually became thinner and fewer. The only after-discharge treatment has been the occasional use of atropine and a two-month rest. One year after the original visit the right comes was The left cornea showed about one half the original number of deposits. These were thin brown, and had a dried out appearance. Vision was 20/25 with -9 50 S -2.50 C × 145

Comment

The progress of the disease while the patient was under intensive treatment was such that it would be difficult to relegate the improvement to any one form of treatment. There was no clear-cut flare-up or decrease in pathology with any one procedure. The only possible therapeutic relationship was the appearance of deposits for the first time in the right eye after the tonsil and sinus surgery and one can not be sure but that this may have occurred without the surgical intervention. Dr Walter V Moore. who saw this case in consultation, concurred with the procedure followed and was of the opinion that there may have been a relationship. Dr. Bernard Samuels, after examining the patient suggested the possibility of a low-grade tuberculous lesion, probably in the flat part of the ciliary body His ex perience has been that these cases do well with complate rest for several months 1

It is conceded that sympathetic ophthalmia is rare without rupture of the globe that the interval between injury and onset is a short one, and that the exciting eye usually shows a persistent low-grade uveitis, with periodic painful exacerbations iris

^{*} Presented before the Brooklyn Ophthalmological Society April 17, 1947

nodules, and a tendency to phthisis bulbi 2 However, there have been published cases where sympathetic disease has been reported without perforation 34 As to time intervals, Fuchs, 5 Weeks, 6 and Knapp' reported cases having their onset as late as twenty, forty-two, and forty-five years, respectively Duke Elder states that sympathetic ophthalmia may follow almost any type of condition, even a clean wound that has apparently healed rapidly and without complications? For these reasons it was felt necessary to include sympathetic ophthalmia in the investigations

Nongranulomatous disease of the anterior uvea is usually acute, with slight iris but marked ciliary reaction, and with no nodule or synechia formation 8 The evudation, being lymphocytic, manifests itself in small, pinpoint corneal deposits, and the eyes recover with few residua This type is believed to be The granulomatous type has a infective in nature more insidious onset, ciliary reaction is slight, and organic changes occur in the iris, with nodule and synechia formation. The evudation, being episynechia formation theliod, manifests itself in mutton-fat corneal deposits, and more or less ocular destruction occurs The recognized causes for this type are syphilis. tuberculosis, lymphogranuloma venereum, fungus infections, sarcoid, and brucellosis In a few cases in which differentiation is difficult, characteristics of both types appear in the same eye

The case under consideration, although apparently manifesting signs of both types, seemed to fall chiefly into the nongranulomatous category most frequent positive findings in this class are rheumatoid arthritis, old gonococcal infection, a

small active focus, or a recent acute infection of some This patient had had a recent cold, and investigation also uncovered infected tonsils and sinuses Since complete work-up eliminated all possible causes of nongranulomatous and granulomatous uveitis except the upper respiratory tract, the logical line of reasoning would lead one to accuse this organ

A case of this type always brings up the subject of hypersensitivity to bacterial protein If organisms of low virulence or in small numbers invade the eve. they can be destroyed by the normal bacteriocidal action of the ocular fluids, but this primary invasion may produce local hypersensitivity to bacterial pro-When the bacterial antigens again reach the eve, through reinfection or absorption from an infected focus, a hypersensitive reaction results Experimental production of such a state has resulted in a nonpurulent ocular reaction similar to the case which came under my observation If this is so, the patient, having had the only possible reactivating foci eliminated, should be more permanently benefited than he might have been by desensitization

SIX REGIONAL HEALTH OFFICES PLANNED FOR STATE

The State Department of Health plans to establish by February 1, 1948, five upstate regions with offices located in Buffalo, Rochester, Syracuse, Albany, and New York City, and a sixth region, with head-quarters also in New York City, to serve the metropolitan area The plan was announced by Dr Herman E Hilleboe, state commissioner of health, in an address, "Planning for Health in the State of New York," which he presented at the Seventy-Fifth Annual Meeting of the State Charities Aid Asso-ciation at the Waldorf-Astoria Hotel, New York City, on December 8, 1947

Explaining the purposes of the proposed offices, Doctor Hilleboe pointed out that the expansion of health services in the modern world suggests a regrouping of the traditional activities of local health departments to permit an enlarged scope of program and the application of multiple technics that will bring improved health and services to the people To reach this important goal, local health services should be directed toward three specific objectives

Prevention and control of mass diseases, including maternal and infant hygiene

- Collection and analysis of vital records, including analysis of morbidity and mortality of the principal killers
- Maintenance and improvement of a healthy environment This includes a continuation of safeguarding food and water supplies, sewage disposal, good housing and the maintenance of healthy environment for recreation and labor

The proposed regional offices will carry these technics into effect. They will provide consultation service to the staff of the district, county, and city health departments within the region, assistance in program planning, development, and operation, guidance to local health departments and observations, for the State Department of Health, of the local health departments located within the region

No direct services to local residents will be given by any of the personnel assigned to these regional offices except in the unorganized district on a temporary basis until permanent plans have been made —Health News, December 22, 1947

A FOREIGN BODY FATALITY

CHARLES C WOLCOTT, M D , Bronxville, New York

(From the Grasslands Hospital)

THE presence of a foreign body in the air or food passages of the body may offer adifficult diagnostic problem. Even an opaque foreign body may be rendered nonopaque by an inflammatory condition. A nonopaque substance may disclose its presence by producing an obstructive emphysema if it prevents the escape of air on expiration or an atelectasis if it prevents the by passage of air on inspiration it is imperative that reentgen examination be made at the beginning and end of respiration. A foreign body must be suspected if a wheere is heard. This wheere may be best heard at the open mouth. Also

In a child who has acquired a foreign body with anyone's knowledge the problem becomes more difficult. This is especially true of esophageal cases. The case herein reported illustrates this situation in

a very dramatic and tragic manner

Care Report

An eleven-month-old child swallowed a large, open safety pin without anyone a knowledge. For the first lew days he presented a progressive anorexia and irritability. His symptoms were not specifically indicative. On the third day emesis developed, followed by refusal of food and a moderate rise in temperature. Early in the morning of the fourth day he became seriously ill with chills, emesis, and supor. The family physician made a diagnosis of precumonla and congenital heart disease.

A reenigen ray examination revealed a large open safety pin in the lower cooplagus with point to the left, and an enormous cardiac shadow the heart occupying most of the left thorax. The patient was admitted to Grassiands Hospital in a moribund state with temperature of 103 4 F. He was given adrenalin, an infusion of 250 cc. of 5 per cent glucose in normal saline 1 Gm. sulfadiasine intravenously and placed in an ovygen tent. His condition improved rapidly and one hour later a clysis of 400 cc. normal saline was started. Two hours later 200 cc. of whole blood was given. This was followed by marked improvement. An esophagoscopy was performed, but the safety pin was not in the esophagus by this time. An area on the left wall adjacent to the heart was swollen and covered with granulations granifying that the pin had been in sile several days Despite intensive indicated therapy the child expired the following morning.

the following morning.

An autopsy was performed a summary of which follows

The pericardial cavity was distended, measuring 7 cm, in its major diameter It contained 150 cc. of coudy gray fluid and many fibrin clots. Both visceral and parietal perseardia were covered by a heavy shaggy grayish, fibrinous membrane. In the interior aspect of the pericardium where it is attached to the posterior mediastnum, a 0.5 cm, laccration, alightly reddened about its edges could be seen. A track could be traced through the abherent mediastinal connective tissue to the cooph agus at its junction with the cardia of the stomach.

Fig. 1 Pericarditis from puncture of pericardium by safety pin in esophagus.

In the right anterolateral wall of the esophagus there were two lacerated areas which extended through the thickness of the wall. One, about 1 cm. long was situated 1 cm. above the cardial opening, the other smaller one lay directly above the first, about 0.5 cm. distant. Both showed reddened and alightly edematous edges. These lacerations correspond to the position of the safety pin as visualized in the x-ray and undoubtedly demonstrate that the pin perforated the copinagus in two places penetrated through the incidiatinum and into the pericardial sac.

The right pleural cavity contained 75 cc. of cloudy

Interignit pictural cavity contained a control fluid, the left about the same. The peritoneal cavity contained a small amount of thin fluid. Aside from the fibrinous pericarditis the heart was remarkable only for its contracted state and rather pallid about the property of the property

Both lungs were atelectatic containing only seat tered crepitant areas. Both were moderately congested. The coophagus, as described, contained a few streaks of fresh blood locally. The stomach was dilated, contained gas and a brownish gray fluid, apparently with occult blood. Just beyond the pyloric spinieter the duodenum was stretched over a 3 cm. ordinary open safety pm, orientated with the closed end distally the point and head toward the stomach. There was some local laceration and the nuccess was strenked with blood. No ponetration of the bowel was noted. Much of the small bowel and all of the large bowel was distended with gas its wall pale and of purchment thinness and transparency. Peyor's patches and mesenteric lymph nodes were readily seen but not much enlarged.

Cultures were taken of heart's blood and pencar-

dial exudate

Gross Findings —Fibrinopurulent pericarditis, traumatic laceration of the lower esophagus by a safety pin with penetration into the pericardial sac, traumatic laceration of the duodenum, safety pin in situ, pulmonary atelectasis, bilateral, pleural effusion, bilateral, and marked ileus of the stomach, small and large bowels

Microscopic Examination—Study of the tissue sections verified the gross diagnosis and added nothing of fresh diagnostic import

Staphylococcus aureus was obtained from both the postmortem blood culture and the culture of

the pericardial fluid

This case illustrates the necessity of early roentgen study in all illnesses of obscure etiology which present themselves

CIVILIAN DOCTORS MAY GET NAVY COMMISSIONS

The statutory authority contained in the Army-Navy-Public Health Service Medical Officer Procurement Act of 1947 makes it possible now for civilian doctors to become commissioned officers in the regular Navy, provided they meet the professional and physical qualifications. This law is unique in that it does away with, for the first time, the age limitation of 32 years, and permits doctors in civilian practice to enter the Navy and be commissioned with the rank up to and including captain. The law considers all strata of the medical profession, interns, residents, reserves, former medical officers who have resigned, and present practicing physicians.

In order to make application, a doctor must be a citizen of the United States, a graduate from a Class "A" medical school, and have served at least one year's internship in an approved hospital. Candidates will then be judged on a number of qualifications, such as being a member of a specialty board, his teaching connections, number of years of professional or scientific practice, hospital or laboratory connections, a statement of military service, and others

Doctors interested should write to the Bureau of Naval Personnel, via the Bureau of Medicine and Surgery, Navy Department, Washington, D C

US DEATH RATES

The year 1946 marks a new record low for the crude death rate in the United States, according to figures of the National Office of Vital Statistics recently released. The death rate for the year was 100 per 1,000 population as compared with the rate of 10 6 for 1945 and the previous lowest rate of 10 4 in 1942. The total number of deaths in 1946 was 1,395,617 or 6,102 fewer than in 1945.

The estimated death rate for the United States in 1947, based on data for the first ten months of the

vear, was 10 1

All figures are for the continental United States

and exclude armed forces overseas

During 1946 deaths from diseases of the heart increased for the third consecutive year. There were 429,230 deaths from heart diseases, or 4,902 more than in 1945, and 11,168 more than in 1944. This cause alone accounted for 30 8 per cent of the total number of deaths in 1946 as compared with 30 3 per cent in 1945 and 29 6 per cent in 1944.

Cancer and other malignant tumors continued to increase in importance as a cause of death. This disease caused 182,005 deaths or 13 0 per cent of the

total number of deaths in 1946

The number of deaths from the other major chronic diseases decreased from those for the previous year. There were 125,646 deaths from intracranial lesions of vascular origin in 1946 as compared with 129,144 in 1945, 81,701 deaths from nephritis

as compared with 88,078 in 1945, and 34,731 deaths from diabetes mellitus as compared with

35,160 in 1945

In 1946 as in 1945 new record lows were set for deaths from the major infectious diseases—pneumonia and influenza, and tuberculosis. The total of 62,234 deaths from pneumonia and influenza was 6,062 or 8 9 per cent fewer than the total of 68,386 in 1945. Tuberculosis caused 50,911 deaths in 1946, 2,005 or 3 8 per cent fewer than the total of 52,916 in 1945.

Maternal mortality also declined to a new low in 1946 Despite the tremendous increase in the birth rate, maternal deaths decreased from 5,668 in 1945 to 5,153 in 1946 From 1945 to 1946, the number of births increased approximately 20 per cent, while the number of deaths resulting from diseases of pregnancy, childbirth, and the puerperium decreased 9 1 per cent

Ninety-eight thousand thirty-three deaths from accidents occurred in 1946, 33,411 as a result of motor vehicle accidents and 64,622 from other accidents. The number of accidental deaths in the United States increased by 2,115 from 95,918 in 1945. This was due entirely to the large increase of 5,335, or 190 per cent, in deaths resulting from motor vehicle accidents.

Other types of accidents caused 3,220 fewer deaths

ın 1946 than ın 1945

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

ATITS meeting on December 11 1947 the Council considered various matters, taking action or directing further study and reports as indicated under the following headings

Secretary & Report

Remassion of State Assessments —Remission of State assessments was voted on account of service with the armed forces for 397 members for 1947 and 68 for 1946, also on account of illness for Drs.
William M Findley, Rudolph D Orth Bernard B
Schnapper and H. F Strongin. The refunding of dues for two members was authorized

Nominations for Affiliate Fellowship in A.M.A.— The following retired members were nominated for

Affiliate Fellowship in A.M.A.

Herbert Richard Charlton Raymond Clark, John A. Conway George P Coopernail, Nathan W Greene, Jacob Heller William H Dodge, H Lyman Hooker, Frederick L. Keays Earl H. Mayne, Joseph Day Olin, William A. Randel, Charles Hich, Henry Schumer, James S. Slavin, William G Sprague, Harold Stearns Vaughn, Augustus B Wadsworth Ceorge Barclay Wallace, and Herbert Budington Wilcox Wilcox.

Meetings -The week following your last meeting it was my privilege to attend two delicious dinors and to hear interesting speeches. First at the one hundred and fiftleth anniversary dinner of the Westchester County Medical Society at the Wal dorf Astoria, and the second at a dinner given by the United Medical Service Inc. and the Associated

Hospital Service.

On November 20 your Secretary attended the Middle Atlantic States Conference of the American Medical Association Council on Medical Service, Along with Drs. Louis H. Baner, Thomas A. Mo-Goldrick, and J. Stanley Kenney and Mr. George P. Farrell. Dr. Frederick E. Lane, a member of our Society connected with the U.S. Veterans Administration, was also present. An outstanding presents tion on the program was made by Dr Bauer entitled "What Can We Do About the Practice of Medicine Within the Hospitals?

Your Secretary has also attended various committee meeting, including the first meeting of the new Subcommittee on Nutrition of the Public Health and Education Committee In Albany on November 28 Health Commissioner Hilleboo and other members of his department met with this com-

mittea

NY State Institute of Applied Arts and Sciences -A request has come from the New York State Institute of Applied Arts and Sciences for nomination of a member of their Advisory Commission. This Com mission consists of representatives of various pro-fessions and businesses and will assist in establishing courses of technical training, such as for medical secretaries.

After discussion, it was soled to table the request for a month in order to obtain more information

Request for Subcommittee on Accident Prevention.—
Request for Subcommittee on Accident Prevention.—
We vork State Health Commissioner Herman E.
Illieboe has requested that a subcommittee be
appointed on accident prevention. It has occurred
to me the commissioner than the contract the to me that perhaps you might like to increase the name and scope of your Subcommittee on Industrial Health Health, of the Committee on Public Health and Education, to include this function. That Sub-

committee consists of Dr Leon H. Griggs Syra cuse, chairman, Dr David J Kalaski New York, Dr Stuart A Good, Buffalo, Dr Leonard Green-burg New York, and Dr Stanley E. Alderson, Albany

After discussion it was rotal that the Subcommittee on Industrial Health be also designated as the Subcommittee on Accident Prevention with the possibility of nominating two or three additional men to it.

Communications.—1 Letter from Dr Harold A. Solomon chairman, Cancer Communitee, Dental Society of the State of New York, dated November 18, 1947, offering to cooperate with our Cancer Committee

After discussion at was voted that someone be designated from the Dental Society to serve on the Subcommittee on Cancer and that the president of the Dental Society be asked to make the designation

Letter from Dr John J Bourke, under date of December 1 1947 requesting nomination to fill vacancy left by the death of Dr F Leelie Sullivan, on the State Advisory Council to the Joint Hospital Survey and Planning Commission representing upstate medical interests.

It was noted that Dr O W H. Mitchell be nomi nated to fill the vacancy

3 Letter from Mr Royal W Ryan executive vice-president, New York Convention and Visitors Bureau Inc., dated December 21 1947, requestion that the Medical Society of the State of New York extend to the American Medical Association an invitation to hold their interim session in New York, in 1949 or 1950

After discussion, 11 was roted to extend the invita tion, but that it not be sent until after the January meeting of the House of Delegates of the A.M.A unless, in the opinion of the delegates attending that meeting, it seems advisable to introduce it at any time.

4 Letter from Dr Norman S Moore of Cornell University Ithaca, under date of December 8, 1947 regarding a letter from Dr Mary B Spatr protesting a resolution of the House of Delegates requiring the submission for censorship of articles written for the

This came up at the preceding meeting of the Council and it was voted that an editorial—it was on the question of writing an editorial-be withheld, and that the Council be requested to submit to the House of Delegates the question of the advisability of continuing this part of the Principles of Profes-

sional Conduct.

After discussion, it was roted that the Council rescind the action that was taken at the last meeting and make a statement that in the opinion of the Council, which is also the opinion of the Counsel of the Bocrety this particular part of Section 31-b may involve infringement of the constitutional right of free speech, and to refer it back to the House of Delegates with the recommendation that it be rescinded, and that an article replace it in the Princi ples of Professional Conduct to the effect that mem here who write for the laity are requested to submit for approval any advertising matter expected to be connected with their writings so that there will be no

danger of their contravening the Principles of Ethics in the advertising

It was roted that Dr Moore's letter be answered and that a letter be sent also to Dr Spahr quoting this action taken by the Council.

Treasurer's Report was accepted

Report of Executive Officer

Dr Hannon reported that he had attended meetings of the Committees of the Society Also he attended the annual meeting of the Schenectady County Society on December 4, and the Chenango County Society annual meeting on December 9

Activities of Committees

Legislation -Dr Harry Aranow, chairman, reported that he had attended a hearing of the Joint Committee of the State Legislature on a proposed bill to insure people for expenses due to illness and unemployment not connected with their work.

Constitution and Bylaws -Dr James R Reuling, chairman, reported that the Medical Society of the County of Erie requested approval of a change in By laws regarding dues

Approval was roted Economics—The following report of the Director of the Bureau of Medical Care Insurance was submitted

Mr Farrell, director, attended a dinner at the Hotel Biltmore, November 19, 1947, at which a report on the progress of United Medical Service was The guest speaker was Mr Bernard M Baruch, who outlined a fifteen-point program to improve medical care

November 20, 1947 Mr Farrell was present at the Middle Atlantic States Conference in Philadelphia, sponsored by the Council on Medical Service of the A M A

November 24, 1947 The Director spoke before the Medical Society of the County of Clinton on the topic "Socialized Medicine and Medical Care Insur-ance" The interest shown by members of the Clinton County Medical Society in the Northeastern New York Medical Service Plan, Albany, was most gratifying It was suggested that a public relations campaign be launched from the county society level through the doctors, to increase enrollment as rapidly as possible

November 25, 1947 In the forenoon, Mr Farrell spoke before two senior sociology classes at Champlain College, Plattsburg That evening he de-bated with Dr Francis Wilson, Ph D, head of the Biology Department of the Associated Colleges of Upper New York, before the Faculty Club of Cham-plan College The subject was "Resolved, That Socialized Medicine Should Be Instituted in the

United States" Your Director, in conjunction December 1, 1947 with Mr Harry G Waltner, Jr, of the Standard Oil Company of New Jersey, spoke before the Mid-Hudson Industrial Association at Poughkeepsie Mr Waltner discussed "Compulsory Sickness Com-pensation" He gave a clear and thorough explanation of the programs which are now in operation in the states of Rhode Island and California, and outlined the fundamental differences in the programs He also described the so-called New Jersey program on which hearings were held in 1946

Fundamentally the difference in the New Jersey program, as compared to California and Rhode Island, is that the state only legislates the minimum standard benefits which will be underwritten by independent commercial insurance companies on a free enterprise and competitive basis The Medical Society of the State of New Jersey was in accord with the proposed program.

Mr Farrell discussed the compulsory health insurance angle, and questions from the floor were answered by both speakers on the two phases dis-

December 2, 1947 By invitation, Mr Farrell spoke before the Port Jervis Community Club, an affiliate of the Federation of Women's Clubs, on the subject of "Health Insurance" It was interesting to the speaker to note how little the group knew about compulsory health insurance and its implications

Finance -- Dr Albert F R. Andresen, chairman, reported that the budget submitted at the November meeting was to be voted upon.

It was roted that the budget as submitted at the November meeting be referred to the Board of Trustees with recommendation for its approval.

Defense and Insurance.—Dr Thomas M D'Angelo, chairman of the board and Mr Wanvig, insurance representative, and Mr Hackeling, auditor, were present Mr Wanvig pre-sented detailed facts and figures on charts Mr Hackeling spoke on the audit There was much discussion, but action was postponed until the Council has had time to study the facts

Office Administration and Policies -The Committee submitted a lengthy report on proposed changes and changes already in operation in office

procedure

Planning Committee for Medical Policies.—Dr Stanley Kenney, chairman, reported that the Committee held an important meeting on December 10 at which all members were present Group practice, possible reorganization of the District Branches, and the State of New York Program for the Care of the Chronically Ill were discussed A report will be presented at a subsequent meeting

Public Health and Education --Dr O W H.

Mitchell, chairman, reported as follows

Activities of the Chairman—On December 10
1947, in New York City, a meeting of the Council
Committee on Public Health and Education with representatives of the State Departments of Health and Labor and some of the officers of the Medical Society of the State of New York was held Areport on the activities of the Committee in the field of postgraduate education since the last annual meetmg was made and plans for the rest of the year, mcluding the Teaching Day on Tuesday of the next annual meeting, were discussed

Study Committee on Gernatrics —A meeting of the Study Committee on Gernatrics was held in New York City on Wednesday, November 19, 1947 Mimeographed copies of Dr. Monteith's report to be given at the hearing of the New York State Joint Legislative Committee on Problems of the Aging to be held on Thursday, December 11, 1947, in New York City, called by Senator Thomas C Desmond, will be distributed at a later date
Subcommittee on Nutrition—Norman S Moore,

M D , chairman "A meeting of the Subcommittee on Nutrition

was held in Albany on Friday, November 28 1947 Present for the State Society were Drs Anderton, Hannon, Beck, Jolliffe, Mitchell, and Moore, for the State Department of Health were Drs Hilleboe, Larimore, and Schlesinger

"The Commissioner of Health, Dr Hilleboe, outlined the objectives of the Food Commission in two

parts

The immediate 10b of saving grain which the Food Commission is handling but would like the cooperation and support of the Medical Society in such matters in which physicians can lend support during the emergency

'2 A long range program of the Food Commission which should involve long range planning in the State Department of Health with the

medical profession.

Considerable discussion about ways and means by which the medical group would be of assistance in the long range program crystallized into the follow ing possible ways that the Medical Society might be of assistance

Support the creation of a Nutrition Divi

sion in the State Health Department.

"2. Support the plea to the curricula committees of the various medical schools of the state to introduce more subject matter concerning nutrition in medical education.

Attempt to inform the physicians of the State regarding, nutrition and attempt to at imulate their interest particularly at the level of the general practitioner. This might be done

(a) Educational articles in the New York STATE JOURNAL OF MEDICINE using as a guide the Handbook of the Food and Autrition Board.

"(b) At annual meetings of Medical Societies work in special reports on the anthropological aspects of nutrition in various cultures and particularly our own culture as a means of stimulating interest.

(c) In the Committee on Public Health and Education, stimulate more programs on the subject of nutrition, perhaps changing the

formula to stimulate more interest.

'(d) Disseminate information regarding the importance of nutrition in all ago groups to the specialists in obstotrics, pediatrics, and geriatrics particularly and bring to the general practitioners of the state the value of a thera pcutic weapon in nutrition in all disease condi-

tions.
"4. Work out with the State Health Depart ment stipends for doctors who take advanced work in nutrition similar to the way in which plans have been worked out for special training in

cancer study

Support the State Health Department s request and the Food Commission's request, for appropriations for research to be carried out in the State at places where qualified nutrition clinics and educational facilities are adequate for special studios

It was roled that the report be approved.

The following is a report submitted by Dr William b. Ayling as a representative of the Medical Society of the State of New York to the conference on the Cooperation of the Physician in the School Health and Physical Education held at Hotel Moraine Highland Park, Illinois on October 16 to 18, 1947

This Conference was attended by prominent physicians health educators, and physical educators from all over the United States and even from Puerto Rico There was free discussion of the topics listed in the program and the general summary was made on Saturday morning Copies of this sum-mary will be available in the near future and as soon

as received one will be sent to you

Postgraduate Instruction —Postgraduate instruction is being presented in the following counties

Chonango, Clinton, Jefferson, Nassau Onondaga Ontario, Otsego St. Lawrenco Ulster and Wayne Requests for instruction to be given in the near

future have been received from Richmond, Schenectady and Sullivan County Medical Societies

Instruction has been completed in the following Broome, Cortland Dutchess Madison. Monroe Orange Oswego Steuben, and Tompkins Subcommittee on Rheumatic Fever -Dr Mitch

clistated that a proposal to give organized attention to rheumatic fever in his committee has been made The Tederal Government through the Children s Bureau has a program The State Health Depart ment also has one. Various foundations are being instituted to finance the study of rheumatic fever The latest one has and rheumatic heart disease. just been announced by the Masonic Lodge are said to be 750,000 Masons in the State of New lork who will probably contribute They have an Advisory Council to help them with their program It is recommended that we have a Subcommittee on Rheumatic Fever to help advise on rheumatic fover programs

It was roted that this recommendation be adopted

It was roted that Dr. Herman E. Hilleboo New 1 ork State Commissioner of Health be named as an advisor to the Council Committee on Public Health and Education.

Publication.-Dr George W Losmak, chairman, reported that the Publication Committee held its regular meeting on December 11 1947 at which time many details were discussed.

Liaison with the Veterans Administration.-Dr Herbert H. Bauckus chairman, reported regarding proposed changes in the fee schedule, as discussed at the meeting of the committee on November 13 1947 These changes will be discussed later with Dr Ethan Flagg Butler Branch Medical Director of the Veterans Administration. To further acquaint the Council I quote from my letter of December 2 to Dr Butler

"I have your note on the duties of the coordi nators Apparently this notice had been re-ceived by the coordinators sometimes before without our knowledge or approval, so I do not know that this makes any difference. I do, in general, approve of the duties as outlined in fact, to have them do anything that would enhance vetorans

I should like to comment upon the supervision of the medical care that the Veterans Medical Service Plan of New York, Inc. is supposed to have over the professional activities. Following the agreement of the first contract in September 1946, opinion spread among the veterans and the public in general that here was a type of service that the medical profession approved of as first class. Our coordinators were specifically directed to observe carefully the professional activities in

the program
I now want to point out that our coordinators have nothing to say about the professional care rendered in Isolities other than by the private practicing physician The recent great diversion from the home town personal care in New York State emphasizes this deficiency Thus the part program vitates much of the responsibility of the Medical Society for upholding high standards of medical practice

Steps should be taken to inform the veterans and the public of this fact We can no longer instances they are the only specialists available in

rural areas

"Under date of August 1, 1947, an opinion of the Attorney General was requested by Miss Donlon as to whether it was within the discretion of the Chairman of the Workmen's Compensation Board to deny authorization to a physician to render medical care under the Workmen's Compensation Law upon the ground that his other full-time employment by the State of New York would make him unavailable at all times to testify at referee and board hearings In this request the Attorney General was informed that the physicians had been recommended as duly qualified by the Medical Society

"Under date of August 19, 1947, Nathaniel L Goldstein, the Attorney General, submitted his reply, a copy of which was received in our office on

November 19, reading as follows

"Your letter of August 1 asks my opinion as to whether it is within the discretion of the Chairman of the Workmen's Compensation Board to decline authorization to a physician to render medical care under the Workmen's Compensation Law, upon the ground that his other full-time employment by the State of New York would make him unavailable at all times to testify at referee and board hearings form me that the physician has been recommended to you as duly qualified by the medical society of the county in which his office is lo-

"Section 13-b of the Workmen's Compensation Law provides that upon the recommendation by a medical practice committee or medical society or board, as the case may be, the Chairman of the Workmen's Compensation Board 'may' authorize physicians to render medical care under the Workmen's Compensation Law (subd 1), and that the recommendations 'shall be advisory to the chairman only and not be binding or conclusive upon him' (subd 2)

"The chairman thus has discretion to determine whether or not a physician recommended to him has the qualifications to merit authoriza-

"I cannot find that the mere fact that a physician is a full-time employee of the state is, without more, adequate reason for denying his application for authorization, since the bases of the application, and accordingly of the authorization, are 'training and qualifications' ization, are 'training and qualifications' (Workmen's Compensation Law Sec 13-b (2)

"Without doubt, the appearance of a physician at workmen's compensation hearings is an integral part of his rendering of medical service to employees. The fact that a physician is a full-time employee of the state does not, however, definitely presuppose that he would be unable to fulfill this obligation to patients whom he has treated under the Workmen's Compensa-

"A question might exist as to whether the conditions of a physician's employment in state service would permit him to accept private practice at all And there are certain positions held by physicians in state service which would be wholly inconsistent with their engaging in private workmen's compensation practice

"Where the physician at the time of making application is engaged in such inconsistent state employment as to affect his qualifications to render full medical service in workmen's compensation cases, including the obligation to

appear when necessary at workmen's compensation hearings, it would appear to me to be within the discretion of the chairman to decline to grant him authorization during the continuance of such employment Of course, each case would require determination upon its own particular facts '

Continuing

"The opinion of the Attorney General sustains the position taken by the State Society, and it would appear that we are on sound legal ground

"Section 19-b of the law prohibits physicians in the employ of the Workmen's Compensation Board, as examiners or director or as a member of the Industrial Council, from engaging in any form of insurance practice No such restrictions, it would seem, are placed upon the physicians in the employ of the state mental hospitals, as evidenced by the Civil Practice Act of this state The Commissioner of Mental Hygiene, in a communication to the Director of our Workmen's Compensation Bureau, is in agreement with this

"In the final paragraph of this opinion considerable discretion is also given to the chairman of the board in the granting or withholding of such

authorizations

"Your chairman took this matter up with Miss Donlon at his most recent conference with her The resolving of the difficulty would seem to be dependent on the willingness of the head of a state department-in this instance the Commissioner of Mental Hygiene—to authorize unequivocally, and without special permission from time to time, absences by his staff physicians to render medical care to Workmen's Compensation chents and to testify as required at Workmen's Compensation

hearings "The logical course to pursue to end this long controversy would be for the Council of the Medical Society to request that Dr MacCurdy, the Commissioner of Mental Hygiene, put in writing, based on his own beliefs and on this opinion of the Attorney General, his authorization permitting staff physicians in his department to render medical care to Workmen's Compensation clients and to testify as required at Workmen's Compensation hearings, and file this with the chairman of the Workmen's Compensation Board done, we are of the opinion that the authorizations now recommended by the Medical Society will be granted Failing in this, it would seem necessary for a physician who has been refused authorization

to have recourse to legal action"

Group Medical Practice—"The Rip Van Winkle Clinic of Hudson, New York, is a group of physicians practicing medicine under the name of the Rip Van Winkle Associates as a partnership, prac-ticing group medicine They are registered in the county clerk's office as doing business under an assumed name other than their own Compensation bills for services rendered by members of the group are rendered on billheads of the Rip Van Winkle Associates, the name of the particular doctor rendering the service being mentioned on the Where insurance carriers make out checks to the doctor, the latter endorses the check over to the Associates There is no question about the right of this group to practice medicine and divide fees under the provisions of the Amended Law of 1947 (Griffith-Milmoe Senate Int 740 of 1947) However, your attention is drawn to the fact that this law which amended the Education Law states no such sharing, division, or apportionment shall be permitted with respect to fees received for

zore than Pacific

actico

ation

in, in

rendering medical care and treatment under the Workmen a Compensation Law A similar circumstance arose in New York City where the socalled Metropolitan Medical Group, formed und the HIP, inquired whether it was logal for the group to place compensation fees earned by d tors in the common funds of the group and si In accordance with the provisions of 1 the Workmen s Compensation Law and the cation Law, section one, paragraph f, subdiv of Section 1264 such sharing or apportions illegal in compensation cases

"This matter is brought to the attents Council before any further attempt is it bring this matter to the attention of the Wor men's Compensation Board and of the Rip Van

Whikle Associates

Your Director appeared before the Nassau County Medical Society on Tuesday, Nov 25, 1947 and conducted a symposium on Workmen s Compensation problems. On Dec 5 he partici pated in an arbitration session at White Plains.

On Dec. 3 he read a paper on physical medicine in relation to Workmen's Compensation practice before the Association of Physicists at the Polyclinic Hospital New York City On Dec. 6 he appeared as a member of a panel before the American Association of Anesthesiologists to discuss the relationship between anesthosiology

and the hospital

Legislation.— The chairman of the Council Committee and the director of the Bureau met with the chairman of the Legislative Committee several weeks ago in connection with legislation which we hope to have introduced at the 1948 session of the Legislature Your chairman has further discussed with the chairman of the Work men s Compensation Board our legislative program in so far as it relates to Workmen s Compen sation, and a conference is to be held on December 17 with the advisory council to Miss Donlon at which time the legislative proposals of the Depart ment of Labor will be presented

At this time the Council Committee on Work men a Compensation would recommend attend

to the following

"Senate Bill Int 1708 (Mr Condon) To amend the Workmen's Compensation Law in relation to the review, revision, or revocation of physiclans' authorization. This bill became law and

took effect July 7, 1947

Senate Bill Int. 2078 (Mr Halpern) To amend the Workmen's Compensation Lew in relation to the place of arbitration of medical bills We approve and recommend the reintroduction of this bill. It would change the law to make the place of arbitration of medical bills in the county in which the services were rendered rather than the county where the claimant resides.

It was roted that this be approved. Senate Bill Int. 2478 (Mr Fino) To amend the Workmen's Compensation Law in relation to the authorization of physicians, medical bureaus and laboratories and payment of medical fees This bill would abolish the Medical Practice Com-

"We have a mandate from the House of Dele-

gains regarding this measure.

Sonate Bill Int 618 (Mr Condon) To amoud the Workmen's Compensation Law in relation to the designation and compensation of medical specialists and examinations and reports by them. This bill is brought before the Council for discussion and clarification. Both the chairman of the ning, at a meeting of Fort Orange crean Association of Social Workers, tal on December 15 tal on December 15 Dr Donald York University Medical School Lhovaca, New York Polyclinic postgraduate course in physi postgraduate course in physical places of the course in physical places of the course of the core of

proper the lay that the Illin from \$10 to \$20 for

'Scnate Bill Int 722 (Dr. the Workmen s Compensation . the maintenance of medical bureau This bill was passed, and vetoe

and

"Our recommendation is to use our influence see that this bill is not reintroduced It origin ated in Chautaugua County gerous bill and every effort should be put forward to prevent its reintroduction

It was roted that the Society use its influence to see that the bill is not reintroduced

Assembly Bill Int. 2712. Introduced by Committee on Rules An act to amend the Workmen's Compensation Law in relation to claims for services in connection with x ray ex amination diagnosis or treatment of claimants by licensed laboratory or bureau of voluntary hospital.

"This is one of the mandated bills from the House of Delegates which requested our Council to test the validity of this act. It would appear that we stand little chance of doing anything about this. I am informed that any attempt to amend it will be opposed by the hospitals and the Governor We would recommend referring this to counsel for advice and disposition

The mandate of the House was not to introduce a bill but to test its legality In the opinion of the Counsel no case so far has presented itself which

would make a proper test case.

Assembly Bill Int. 1283 (Mr Clancy) To amend the Workmen's Compensation Law in relation to x ray diagnosis x-ray treatment and radium treatment. This is an excellent bill. It should be reintroduced and pushed strongly

It was voted to sponsor this bill.

The Committee was given power to act with discretion after further conference with Miss Donlon and Mr Martin on the following. Medical Inspection under 13-1 to be in accordance with Section 13-a (4) that when an inspection is made, unless the doctor waives his right be has a right to be present and the patient has a right to designate him to be present and the enforcing of Section 13-g provides that if an insurance carrier or employer does not object to a doctor's bill within thirty days the bill is presumed to be fair and reasonable

Dr Kaliski stated that the Workmen's Compen sation Law was amended in 1947 to include in the

coverage the executives of corporations.

After discussion it was roted that Dr. Kaliski

OLUMBIA University has received funds total-COLUMBIA University has recently according to the American Cancer Society, ing \$28,376 from the American Cancer The funds Inc, for research and study on cancer The funds were payment on part of the numerous projects

underway on cancer research at the University

One of the largest gifts \$-\$7,368 was for the continued study of the application of the isotope technic to the problems of clinical medicine in man. The work is being carried on by the department of biochemistry, in the University's College of Physicians

and Surgeons Among the other projects provided for in the funds were research on cells in vitro, and research on nucleic acid of normal and cancer tissues, both by the department of surgery, and a study of animal tissues by the department of medicine

In addition, Columbia also announced receipt of a payment of \$2,250 from the New York City Cancer Committee of the American Cancer Society for clinical research on gynecologic cancer to be carried on by the department of obstetrics and gynecology

HOSPITAL NEWS

Experimental Mental Hygiene Clinic to Open in Brooklyn

A N EXPERIMENTAL mental hygiene clinic to discover how mental hygiene services can be brought by the Health Department to the mass of New Yorkers, at a price they can afford, is to be opened this month at the Red Hook-Gowanus Health Centre in Brooklyn

The staff will be headed by a half-time psychiatrist, a full-time psychologist, a psychiatric nurse, psychiatric social worker, and a secretary For the present, only residents of the district will be Psychotic and neurotic cases will not be treated at the new clinic, which is designed for lesser mental disturbances that threaten to develop into serious disease if untreated, but will be referred to hospitals in the borough

Another duty of the clinic's staff will be to instruct the other Health Department clinical workers throughout the city in recognizing incipient mental Research into the mental health of the Red Hook-Govanus district, one of the poorest in New

York City, also will be attempted
Policy will be set by an advisory committee
named by Health Commissioner Harry S. Mustard under the advice of the New York Mental Hygiene Committee of the State Charities Aid Organization. This committee, composed of seventeen physicians and social workers, is headed by Dr Abraham Z Barhash, director of the division on community clinics of the National Committee for Mental Hygiene

Job Survey for Cardiac Cases at Bellevue

TWELVE-MONTH survey to determine the physical capacities of persons with heart disease and to advise those in unsuitable vocations has been opened at the Bellevue Hospital Cardiac Clinic by the New York University College of Medicine and the division of vocational rehabilitation of the New York State Department of Education, it was announced recently

Dr Clarence E de la Chapelle, associate dean of the college, said "this survey will probably provide the first analysis ever made of the physical, mental, and vocational capabilities of a large group of individuals with heart disease, as well as of their needs for occupational readjustments "

Expected to cover 1,000 new patients, the survey is an addition to the clinic's standard task of diagnosing and treating heart conditions and is an outgrowth of the work classification unit established in 1941 by the college and the United States Employment Service The service sent job applicants with heart disease to the unit, where their job capabilities were evaluated The precaution was taken to prevent heart disease sufferers from aggravating their conditions on unsuitable jobs

Awards by National Council for Cancer Study

 $T_{
m awarded}^{
m HE}$ National Advisory Cancer Council has awarded \$593,130 to twenty-six medical schools in grants for improvement of cancer teaching Memorial Hospital in New York City received \$30,-000 for cancer pathology and medical training and an additional grant of more than \$100,000 for five research projects on cancer, the Columbia Univer-sity College of Physicians and Surgeons received \$23,976 for coordination of existing instructional

programs, the New York University College of Medicine received \$24,732 for improvement of cancer teaching, the New York Medical College re-ceived \$24,900 for the teaching of neoplastic diseases, the University of Rochester received \$25,000 for improvement of teaching and research in neoplastic diseases, and Syracuse University Medical College received \$24,900 for improved cancer teaching

NEWS NOTES

To ease the pressure upon Huntington Hospital's facilities, a new wing is to be added to the present It will provide a larger children's ward on the first floor, a five-bed women's medical ward on the second floor, and additional private and semi-private beds on the third floor. This will bring the total capacity of the hospital to 95 beds plus 22 basinettes

The first in the American Hospital Association's 1948 series of institutes on hospital personnel relations will be held at the Henry Grady Hotel, Atlanta, Georgia, on February 23, 24, and 25 Planned to give assistance and to stimulate conscious planning for improved employee relations, the institute is not designed to train personnel officers but to aid hospital administrators develop and maintain efficient work forces which will result in better patient care and more effective and economical operations

Dr B C J G Knight of the Wellcome Physio-logical Research Laboratories Beckenham Kent, England, spoke on 'Essential Motabolites and Anti-metabolites' at the William Henry Welch Lecture at Mount Sinai Hospital, New York City, on Janu-

The Atomic Energy Commission has approved expenditure of \$615 000 to provide a center at the University of Rochester for training doctors and technicians in meeting problems of atomic energy development The money will be used the com mission said, to build and equip a six-story medical and biological training and research center

Plans for a six-story building the first stage in a three-stage plan which will result eventually in a completely new hospital for Bronxville were an nounced recently by James A. Lyles, president of the Lawrence Hospital board of governors.

With the completion of the new building, the hospital's present 104-bed capacity will be increased to about 100 beds Mr Lyles said, and when the ulti-mate goal is realized there will be between 250 and 300 beds. All of the building operations will be on

the present site

The Yates County Memorial Committee appointed nearly two years ago has agreed that the proposed wing of the Soldiers and Sallors Memorial Rospital in Penn Yan shall be designated as a mem orial for those who died in military service during World War II

The board of directors has arranged that in the new 22-bed wing, departments, beds, rooms, and services may be sponsored by individuals as mem orials for their loved ones.

The new wing will allow also for expansion of the maternity department, provide a more adequate nursery will house the pathologic and clinical labora tory and permit the establishment of a children s department a service long needing larger quarters A complete new laundry will be added and what the directors call "the most heartening aspect' of all will be the establishment of a much needed emer gency operating room and admission room.

Establishment of a rehabilitation clinic especially designed for the treatment of patients disabled by cerebral-vascular accidents has been announced by Beth Israel Hospital New York City The clinic will also train individuals, mostly in the upper-ago brackets who suffer from hardening of the arteries and high blood pressure, to live useful lives within the limits of their disability Eventually according to Dr Maxwell S Frank, hospital director the clinic will broaden the program to include other types of dısability

The Council of Rochester Regional Hospitals has recommended to the board of directors of F F
Thompson Memorial Hospital that a new 50-bed
wing be constructed to provide badly needed space
and other new facilities for the Canandaigua institu tion When Thompson Hospital was completed in 1904 it could care for 34 patients. The addition of a wing for the maternity section increased the capacity of the hospital to 70 beds. In more recent years shifting of facilities and the use of the hospital porches has made the hospital a 96-bed institution

Lockport City Hospital has recently reopened a 22-bed section, closed for eighteen months because of the shortage of nurses. New members are still needed for the nursing staff however

Plans are underway for the enlargement of the Southside Hospital, Bay Shore with the addition of two new wings and a large central annex. Private rooms are to be increased from 19 to 87 semiprivate rooms from 20 to 52 and the four and five-bed rooms and nursery rooms also will be increased

The Brooklyn State Hospital Psychiatric Forum will hold meetings regularly on the first Thursday of Meetings will take each month throughout May place in the auditorium of Brooklyn State Hospital 081 Clarkson Avenue, at 8 30 p.m

Dr Franklin Hanger professor of medicine at Columbia University, College of Physicians and Sur geons and chief of medicine at Columbia Presby terian Medical Center New York City, was guest speaker at the January staff meeting at the Veterans Administration Hospital Castle Point His subject was disorders of the pancreas

At the December meeting of the staff of Vassar Brothers Hospital, Poughleepsie, Dr J R. Lock wood presented a review of the cardiac cases admitted to the adult medical ward from June 1, 1946 to June 1 1947 The discussion was by Dr Scott Lord Smith and Dr Reuben T Lapidus

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Plans Announced for 12th Annual Auxiliary Convention

ARRANGEMENTS for the 12th Annual Convention of the Woman's Auxiliary to be held at the Hotel Pennsylvania, New York City, from May 17 to 21 1948, are now being planned under the direction of Mrs. Clifton L. Dance, Brooklyn, chairman of the State convention and Mrs. William Lavelle Long Island cochairman

With every organized county in the State represented by delegates the convention is expected to be

the largest in the Auxiliary's history

All doctors wives, whether or not they are members of a county Woman's Auxiliary are invited to attend this convention and to participate in the pro-

Since the Auxillary meeting coincides with the 142nd Annual Meeting of the Medical Society of the State of New York, also to be held at the Hotel Pennsylvania, a number of social and entertainment events are being planned for the wives who accompany their husbands

Midwinter Executive Board Meeting Held

WITH State President, Mrs. Harry F Pohlmann, Middletown, presiding, the midwinter meeting of the executive board of the Woman s Auxiliary to the Medical Society of the State of New lork was held January 6 and 7 in Rochester Nineteen of the 42 organised county groups were represented at the session

Dr Elton R. Dickson Binghamton, a member of the advisory council for the State Auxiliary brought greetings from the State Society and discussed medi-cal care plans and the need for active interest in State and federal legislation affecting the medical Profession.

"Women in England' was the topic of a talk by Mrs. Dexter Perkins, who has edited several edi tions of the Fannie Farmer Boston Cook Book

Reports from various officers revealed that all the Anxiliance are actively engaged in public relations work and are ready to continue their active interest in legislation affecting the medical profession

On the recommendation of Mrs. Bradford F Golly finance chairman a resolution was adopted Instructing counties to make checks payable to the Physicians' Home, thus eliminating the necessity of the the checks payable to the Physicians' Home, thus eliminating the draw sense. the State Auxiliary treasurer having to draw sepa rate checks for each county contribution to the Home. Checks can be mailed to the State Auxiliary chaliman of the Physicians' Home, Mrs George P Bergman, who will in turn send them to Dr Wallace B. Hamilton, State Society chairman for the Home. This action was decided following Mrs. Golly's recommendation and considerable discussion among the group

At Wednesday morning's meeting, the points presented for the Auxiliary by the State Medical Society chairmen for public relations and legislation were discussed as was the advasability of Auxiliary members attending public meetings of other organi-zations where medical topics are under discussion.

In order to distribute annual reports, a resolution was passed to the effect that the district councillors synopsize county president reports and that these reports be mimeographed with the State President s report, for distribution.

Announcement was made of the State Convention at the Hotel Pennsylvania, New York, from May 17 to 21, and of the national convention at the LaSalle Hotel Chicago from June 21 to 25 Delegates and officers were urged to make early reservations

With members of the Monroe County Auxiliary acting as hostesses the session was most successful. In charge were Mrs. Harry I. Norton, seventh dis-trict councillor and Mrs. Charles I. Miller Monroe

County Auxiliary president

Roving reporters from Station WVET interviewed members of the Auxiliary in the Hotel Seneca during room at breakfast, giving them an opportunity to explain the alms and objects of the Woman's Auxiliary The Monroe County Auxiliary press and publicity chairman, Mrs. Montgomery Leary arranged for a reporter and photographer to cover the Wedneeday meeting.

COUNTY NEWS

Dutchess County

The Woman's Auxiliary to the Dutchess County Medical Society held a Christmas party December 10 at the Golf Clubhouse Hudson River State Reprint Mrs. Frederick J. DeNatale was hostess. actuated by Mrs. Albert Lafleur and Mrs. Donald Schwartz. Christmas decorations were featured, and gifts were exchanged.

No meeting of the Auxiliary was held in January

Erie County

The first monthly meeting for 1948 of the Woman's Auxiliary to the Eric County Medical Society was held January 27 at the Hotel Statler Buffalo, with a luncheon and business meeting

A new constitution for the Auxiliary, presented by Mrs. Benjamin Smallen, chairman of the special committee on revision of the constitution was given its first official reading. 328

Additional feature of the January meeting was an address on "Interior Decorating"

Queens County

Officers of the Woman's Auxliary to the Queens County Medical Society were installed December 9 at a luncheon meeting in New York City, with Mrs William Godfrey, Flushing, serving as the inducting officer Mrs Thomas D'Angelo, Flushing, was chairman of the luncheon

Taking office were Mrs Daniel Swan, Flushing,

president, Mrs William Flanagan, Richmond Hill, vice-president, MrsJohn Finnegan, Flushing, treasurer, Mrs John Keating, Forest Hills, assistant treasurer, Mrs Benjamin Coleman, Kew Gardens, secretary, and Mrs Harry Secky, Astona. historian

Delegates to the State convention are Mrs Harold Foster, Corona, retiring president, Mrs Joseph Hallinan, Richmond Hill, and Mrs James Dobbins, Flushing

Mrs Samuel Klein, Jackson Heights, was chosen president-elect, to take office January 1, 1949

We are proud to announce

Acnomel

a significant advance,
clinical and cosmetic,

in acne therapy

Now, for the first time, you have a preparation which fulfills the two prime requirements for the successful treatment of acne

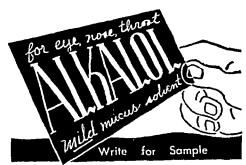

- 1 Therapeutic excellence An exceptional vehicle assures the effectiveness of Acnomel's tried and proved active ingredients—sulfur and resorcinol
- 2. Cosmetic excellence Delicately flesh tinted, Acnomel not only harmonizes so well with the skin as to be virtually invisible, but it also masks unsightly lesions. This, plus its pleasant odor, will make your patients like to use Acnomel.

ACNOMELS therapeutic superiority will please the physician, its cosmetic superiority will please the patient. It is available, on prescription only, in 11/2 oz. tubes

BOOKS

REVIEWED

Handbook of Psychiatry By Winfred Overholser, M.D., and Winifred V. Richmond, Ph.D. Octavo of 252 pages Philadelphia, J. B. Lippincott, 1947 Cloth, \$4.00

Written chiefly for the "nontechnical reader" and covering briefly almost the whole range of personality disturbances, this book by two authorities from St Elizabeth's Hospital in Washington, D.C., can be warmly recommended

ANDREW BABET

Sir W Arbuthnot Lane, Bart., C.B., MS, F.R.CS His Life and Work By W E Tanner, FRCS Octave of 192 pages, illustrated. Baltimore, Williams & Wilkins Company, 1946 Cloth, \$450

This is an interesting and instructive biography of one of the great in medicine and surgery. It is somewhat unusual in that the author is free in his quotations from those who refused to follow Dr Lane in all pronouncements. To those of us who were active in the days of Lane's kink, intestinal stasis with colectomy, the book is nostalgic. Lane's contributions were more vital and lasting than these. He was among the first to emphasize the necessity of surgical asepsis.

JOSEPH RAPHAEL

Pharmacology, Therapeutics, and Prescription Writing For Students and Practitioners By Walter Arthur Bastedo, M D Fifth edition Octavo of 840 pages, illustrated Philadelphia, W B Saunders Co , 1947 Cloth, \$8 50

The fifth edition continues much the same as previous ones. Although the newer drugs of importance are included, such as the anti-histaminics, anticoagulants, folic acid, thiouracil, and the anti-biotics, hardly more than a paragraph or a page is devoted to each. This is not a learned book, the references are poor. There is little on the chemistry of drugs, but it contains many hints which will appeal to the practitioner. Pharmacology from the toxicologic viewpoint is well covered.

JOSEPH R DI PALMA

Diagnostic Examination of the Eye Step-by-Step Procedure By Conrad Berens, M.D., and Joshua Zuckerman, M.D. Octavo of 711 pages, illustrated Philadelphia, J. B. Lippincott, 1946 Cloth, \$15

This book is organized skillfully into three main divisions. Part one includes the method of taking a proper history, evaluation of the complaints of the patient, and a correct determination of visual acuity. The second part describes the test for fusion, the postcycloplegic examination, and the determination of depth perception. The third part includes a clear description of the use of the more common and uncommon instruments employed in ophthalmology, such as the exophthalmometer, the rotary cross cylinder, the tonometer, and the biophotometer. This book gives the ophthalmologist and the general practitioner an opportunity to observe a clear method of a thorough and complete diagnostic examination of the eyes of both adults and children.

BOOKS

[Continued from page 332]

By J A. C Brown Psychiatry for Everyman M B Duodeeimo of 247 pages New York Philosophical Library, 1947 Cloth, \$3 00

This is a sound, reliable, and not too complicated résumé of some basic theories in psychiatry Ita well written and well balanced and should appeal to the lay public for whom it was written.

ANDREW BABET

Office Endocrinology By Robert B Greenblatt, D Third edition Octavo of 303 pages, illustrations MDSpringfield, Ill., Charles C Thomas, 1947 Cloth, \$4 75

This work, now in its third edition, is a popular book much appreciated by practicing gynecologists who derive sound advice for the treatment of many of the common gynecologic ailments of endocrate origin The treatment of other endocrine conditions is only touched upon and does not seem to form an essential part of this book Criticism of these shortcomings could be avoided if the title of the book were changed to fit its intended limitations

MAX A GOLDZIEHER

Are You Considering Psychoanalysis? Edited by Karen Horney, M D Octavo of 262 pages. New York, W W Norton & Company, 1946 Cloth, \$300 The intent of the authors is an excellent one.

With the increasing interest in psychologic problems, more people are considering being analyzed Many doubts assail them What is analysis? Whom shall they consult? What shall they expect of the analyst? The authors seek to answer these questions simply and sincerely However, one wonders if they have not lost sight of their intent when they are the same of the same appeals of enter into a discussion of the various schools of psychoanalysis and attempt to evaluate them This would seem to confuse the prospective patient rather than aid him The detailed discussion of what constitutes a neurosis also seems needless, \$ page or two would have served better The general practitioner will benefit from reading the book more readily than the prospective patient

JOSEPH L ABRAMSON

Internal Medicine in General Practice By Robert Pratt McCombs, M D Second edition. Octavo of 741 pages, illustrated Philadelphis, W B Saunders Co, 1947 Cloth, \$800

Dr McCombs is now senior attending physician at the Pratt Diagnostic Hospital The work is clearly written and has the same high excellence as the first edition Chapters on psychiatric disorders and common vascular diseases of the extremities have been added The book has been brought up to date m the realm of the newer therapeutics The medical student, general practitioner, and specialist in extra medical departments will find it very practical.

MEYER A RABINOWITZ

immunology and allergy as applied to everyday practice. They have included a great amount of useful information on diagnostic procedures, their execution and interpretation, as well as the names of pharmaceutical houses which produce the material in question. For quick ready reference this book is good, but there are many things not covered.

ANDREW BABEY

The Medical Clinics of North America Mayo Clinic Number July, 1947 Octavo Philadelphia, W B Saunders Co, 1947 Published Bi-Monthly (six numbers a year) Cloth, \$16 net, paper, \$12 net.

The Mayo Clime Number of the Medical Climics of North America contains a symposium on blood transfusion and the Rh factor. Outstanding are papers on radiophosphorus, the treatment of myasthenia gravis, histamine antagonists, atomic energy in medical practice, and a consideration of "certain diseases of international importance"

Among the more conventional "clinics" are lengthy ones on uremia, spondylitis, convulsive disorders in children, exfoliative dermatitis, and the diagnosis of duodenal ulcer This is one of the best Medical Clinics which has ever been published

MILTON PLOTZ

Adjustment to Physical Handicap and Illness A Survey of the Social Psychology of Physique and Disability By Roger G Barker, Beatrice A Wright, and Mollie R Gonick. Octavo of 372 pages, illustrated. New York, Social Science Research Council, 1946 Cloth, \$200 (Bulletin 55)

We can hardly do justice in a short review to the tremendous effort and excellent presentation of the work of the authors. Their evaluation of the relationship of various disabilities to psychologic attitudes of those afflicted is thought-provoking. One might wish that they did not use the term "crippling" and "crippled persons," but one has to commend the authors on this worth-while presentation of a subject which deserves our closest attention, especially at this time when most of us are, in one capacity or another, treating disabled veterans. It is a timely addition to the literature in the field of social science.

JOSEPH L ABRAMSON

Roentgen Interpretation By George W Holmes, M D, and Laurence L Robbins, M D Seventh edition Octavo of 398 pages, illustrated Philadelphia, Lea & Febiger, 1947 Fabrikoid, \$700

A worthy successor to the previous editions of Holmes and Ruggle's Roentgen Interpretation, this text book, now in its 7th edition, has been well recognized for the past twenty-eight years. Dr Laurence L Robbins, who has succeeded Dr George W Holmes as chief of the department of radiology of the Massachusetts General Hospital, brings to this edition the more recent advances in diagnosis and treatment, thus maintaining its high standard

Students of medicine might well include Roentgen Interpretation in their library as one must recognize, as did the authors many years ago, that without a knowledge of radiology one's medical education is indeed wanting. The book is informative, thorough, and contains not only tables for comparative studies of allied lesions, but also a very complete bibliography permitting the student greater entree into this relatively new branch of medicine

MILTON G WASCH

Quantitative Clinical Chemistry By John P Peters, M D, and Donald D Van Slyke, Ph D Second Edition "Interpretations" Volume I Octavo of 1,041 pages, illustrated Baltimore, Williams & Wilkins Company, 1946 Cloth, \$700

This is a review of the first volume of the second edition of Peters' and Van Slyke's great work. Although the original edition was issued in two volumes, one on *Principles* and one on *Methods*, the second edition is being expanded into three volumes. The tremendous increase in important material which Dr Poters had added has necessitated his presenting the section on *Principles* in two volumes

The first part deals with carbohydrate and is divided into three large chapters, first on chemistry, then physiology, and finally clinical applications. It is most complete and is scholarly written. The author's arguments against the use of insulin without glucose in the treatment of diabetic acidosis are good. His description of so-called alimentary glycosuria is not much different from mild diabetes.

It is undoubtedly the most important book on the subject. The clinician will do well to use this as a reference book, for it provides a fine chemical and functional basis for the understanding of many diseases in medical practice.

WILLIAM S COLLENS

The Drama of Sex. By James Lincoln McCartney, M D Octavo of 147 pages, illustrated New York, Stratford House, 1946 Cloth, \$2 50

This book has been prepared by an authority with an excellent psychiatric background. Its failing, one which books of this type usually have, is that it gives too much attention to the details of the sexual act. It probably would be too stimulating to anyone in early sex life. A mature physician will appreciate its value.

BERNARD SELIGMAN

Calcific Disease of the Aortic Valve By Howard T Karsner, M D, and Simon Koletsky, M D Octavo of 111 pages, illustrated Philadelphia, J B Lippincott Co, 1947 Cloth, \$500

This is a very handy book of reference which covers the pathology of aortic stenosis quite completely and the clinical features adequately. It is so common for calcific disease of the aortic valve to be considered in differential diagnosis and also so common for a certain amount of confusion to be expressed about its clinical signs and symptoms, that this volume should prove useful indeed

ANDREW BABEY

Medical Addenda. Related Essays on Medicine and the Changing Order By The New York Academy of Medicine Committee on Medicine and the Changing Order Octavo of 156 pages New York, Commonwealth Fund, 1947 Cloth, \$1 75

This is a series of eight essays on present trends in the social aspects of the practice of medicine. The poorly chosen title gives little clue to the nature of the essays which supplement and round out the New York Academy of Medicine's monographs on Medicine and the Changing Order. Reading this little book will not only give the physician some idea of the nature of the problems facing him today but will restore his pride in belonging to a profession with so many opportunities for dedication and service to the community

TRI SULFANYL permits greater bacteriostatic activity with a minimum potential of crystaliuma It is formulated on the new knowledge that a saturated solution of a sulfonamide could still be fully saturated with a second and third sulfonamide of different molecular structure By using combinations of partial dosages of 2 or more therapeutically equivalent sulfonamides the danger of precipitation in the urmary tract is sharply decreased While two are appreciably safer than one a mixture of three sulfonamide compounds is even significantly less toxic ' (Proc. Soc. Exp. Biol. & Med. 64.393, 1947).

Announcing

MICROPELLETS PROGYNON

(aqueous suspension, alpha-estradiol)

a new departure un estrogen therapy

MICROPFLIFTS PROCYNON provide a unique and completely new technic for parenteral administration of pure alpha-estradiol. For the first time it has become possible to suspend the primary follicular hormone in the form of MICROPELLETS in normal saline Prolonged and constant absorption from a semi permanent depot is established in the tissues by a simple intramuscular injection. Where

injections of an oil solution are not feasible or desirable, a single injection of 1 mg. of Michopellets Progynon may be substituted in order to achieve prolonged control

MICROPELLETS PROGYNON offer economy in estrogen therapy while providing the complete safety and freedom from side effects inherent in natural hormones.

MICROPELLETS PROCYNON are available in multiple dose vials of 10 cc., each cubic centimeter containing 1 mg of pure alpha-estradiol (12,000 R.U or 120,000 LU) Boxes of 1 and 6 viols.

IRRITABLE BOWEL SYNDROME "Therapeutic efforts toward the relief of constipation in patients with an irritable bowel syndrome must be continued over prolonged periods of time. Cathartics which exert their action by direct irrigation of the intestinal mucosa have no place in long term bowel management. The most satisfactory results were obtained with a hydrophilic mucilloid [Metamucil] prepared from psyllium seed..."*

METAMUCIL

When prolonged treatment is indicated, Metamucil the "smoothage" management of constipation fits well into the program

Smooth gentle, normal evacuation—the desired action the irritable bowel syndrome—is afforded by the use of Metamucil

Metamucil is the highly refined mucilloid of Plantago ovata (50%) a of the psyllium group combined with dextrose (50%) as a dispersing agent. Metamucil is the registered trademark of G D Searle & Co Chicago 80 Illinois

NUMBER 3 OF A SERIES

CHOLINE

For a Better Prognosis In Chronic Hepatitis

The recognition of dietary deficiencies as factors in the otiology of carrbosis has opened a new epoch in the therapy of hepatic dysfunction. A deposit of fat in the liver is known to precede or accompany degenerative tissue changes, and emphasis is being placed upon recognition of these factors giving rise to fatty infiltration.

Under ordinary condutions a good diet should con tain a supply of hipotropic agents adequate for normal hepatic metabolusm of fat. However factors such as protracted illness, chronic alcoholism abnormal levels of fat ingestion specific deficiencies of protein and cerbohydrate, a generally lowered intake or utilization of food and exposure to certain toxic agents may give rise to fatty inflitration of the liver

Success in therapy of chromo hepatitis (cirrhoes) is dependent upon early recognition of hepatic pathology and those factors predisposing to liver damage. The key-note of modern therapy is prevention of irreversible degeneration by early diagnosis and the prompt correction of dietary deficiencies.

Syrup Choline Dihydrogen Citrate (Flint) a completely palatable form of the lipotropic agent choline, is indicated in conditions in which hepatic dysfunction is associated with impaired lipid metabolism

Syrup Choline Dihydrogen Carrate (Flint)—23 per cent W/V—15 supplied in pint and gallon bottles

Experience is the

best teacher

It's true in cigarettes too!

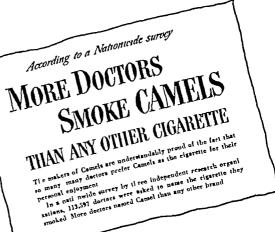

MORE PEOPLE ARE SMOKING CAMELS THAN EVER BEFORE

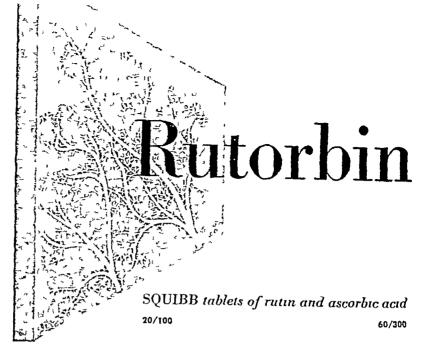

YES, experience is the best teacher in choosing a eigarette. And with millions of smokers who have tried and compared different brands of eigarettes, Camels are the "choice of experience".

Try Camels yourself See how the full, rich flavor of Camel's choice, properly aged and blended tobaccos pleases your taste See if Camel's cool, cool mildness isn't mighty welcome to your throat

Let your own experience tell you why more people are smoking Camels than ever before.

R. J. Reynold Tebarra Co. Wlaster-Selves, N. C. when vascular walls weaken

A new therapeutic combination of rutin and ascorbic acid, generally effective in restoring and maintaining capillary integrity. Many cases of increased capillary fragility or permeability respond to rutin therapy, but rutin alone appears to be less effective until any existing ascorbic acid deficiency is corrected.

Minimizes danger of vascular accidents

Rutorbin is useful for prophylaxis and therapy of hypertensive patients with increased capillary fragility, a group especially predisposed to retinal hemorrhage, apoplevy and death. Restoration of capillary integrity with Rutorbin minimizes the danger of such vascular accidents. Rutorbin has no hypotensive effect. It is nontouc, easy to take, and well adapted for prolonged maintenance therapy.

Rutorbin is indicated in other conditions accompanied by increased capillary fragility—diabetic retinitis, purpura, and drug idiosyncrasy (thiocyanates, arsenicals, etc.)

Available as Rutorbin Tablets 20/100 (20 mg rutin 100 mg ascorbic acid) Bottles of 100 Also Rutorbin Tablets 60/300 (60 mg rutin, 300 mg ascorbic acid) Bottles of 50

"The Importance of Protein Foods in Health and Disease"

Free—let us send you a copy now

Written by a practicing physician, in conjunction with the Nutrition Division of Swift & Company, this booklet provides a convenient source of reference for all the important, new, published findings concerning the value of protein in the human diet

The booklet is broad in its scope, covering the subject from the general significance of protein in nutrition to specific clinical aspects. In addition, high caloric, high-protein diets—for both oral and tube-feeding—are included The Importance of Protein Foods in Health and Disease' provides a practical, working handbook of protein feeding Let us send you your copy now Simply write Swift & Company, Dept. SMB, Chicago 9, Illinois

Palatable answer to many problems of protein supplementation

The new Swift's Strained Meats are being used more and more in soft diets where a high-protein intake is indicated. The six kinds of Swift's Strained Meats—beef, lamb, pork, yeal, liver and heart-provide an exceptionally palatable source of complete, high quality proteins, B vitamins and iron Developed originally for infants, Swift's Strained Meats are 100% meat, soft and fine in texture-easily adaptable to tube-feeding

The booklet The Importance of Protein Foods in Health and Disease is accompanied by a sup plementary pamphlet containing simplified highprotein diets, for both oral and tube feeding, using Swift's Strained Meats Send for your

to convert
the diabetic
into a
more normal
person

"The ideal in therapy is to convert the diabetic into a normal person" While certain restrictions must always be imposed, many patients can be controlled through diet alone so as to dislocate their normal habits as little as possible In those cases where insulin therapy is also required, control may often be attained with but one daily injection of Wellcome' Globin Insulin with Zinc Its intermediate action is adaptable to the needs of most mild and many moderately severe cases and adequate control can usually be achieved in three clearcut steps

- 1. Stabilize the patient as well as possible on a diet of the desired caloric content. Give a single dose of 15 or 20 units of 'Wellcome' Globin Insulin 30 minutes or more before breakfast.
- 2. Adjustment to 24-hour control Gradually adjust the Globin Insulin dosage to provide 24-hour control as evidenced by a fasting blood sugar level of-less than 150 mgm or sugar-free urine in the fasting sample
- 3. Adjustment of diet Simultaneously adjust the carbohydrate distribution of the diet to balance insulin activity Initially this may be 2/10 (breakfast), 4/10 (lunch), and 4/10

(supper) Any tendency toward mid-afternoon hypoglycemia may usually be offset by giving 10 to 20 grams of carbohydrate between 3 and 4 pm The final adjustment of carbohydrate distribution may be based on fractional urinalyses

Systematic attention to these details will make possible adequate control of most mild and many moderately severe cases of diabetes with a single daily injection of 'Wellcome' Globin Insulin with Zinc

Wellcome' Globin Insulm with Zinc is a clear solution, comparable to regular insulm in its freedom from allergenic properties. Available in 40 and 80 units per cc, vials of 10 cc. Accepted by the Council on Pharmacy and Chemistry, American Medical Association Developed in The Wellcome Research Laboratories, Tuckahoe, New York, U.S. Patent No 2,161,198 LITERATURE ON REQUEST.

WRITE FOR DESCRIPTIVE LITERATURE

The fluid that inundates the tissues during congestive heart fail ure may pass through approximately one and one half acres of capillary wall Following an intramuscular or intravenous injection of MERCUHYDRIN edema fluid comprised of water and salts chiefly sodium chloride is mobilized back through the one and one half acres of the capillary bed and is eliminated through the kidneys. The diuresis obtained with MERCUHYDRIN benefits not only the patient with palpable edema but also the patient subject to cardiac decompensation. The effect on dyspinea in these cases of left sided failure is probably largely a result of diminution in pulmonary edema, even though the latter is clinically occult."

The management of cardiac decompensation is greatly facilitated and the comfort and well being of the patient is greatly increased by administration of

MERCUHYDRIN early concurrently with digitalization

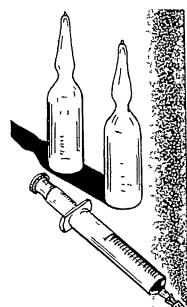

MERCUHYDRIN in a systematic schedule of repealed doses as maintenance therapy

MERCUHYDRIN by intramucular injection, well tolerated locally and systemically and affording highly effective diureris

MERCUHYDRIN (meralluride sodium) is available in 1 cc. and 2 cc ampuls

*Fishberg, A. M.: Heart Failure Lea and Febiger Philadelphia 1946 p. 733

CUT SULFADIAZINF OR SULFATHIAZOLE TOXICITY

More than half the toxic reactions due to these drugs are caused by the crystallization of one of their forms in the kidney. This is reducible by maintaining the urine in a slightly alkaline state

Lacto-Diazine (Suspension of Sulfadiazine with Sodium Lactate, Lilly) and Lacto-Thiazole (Suspension of Sulfathiazole with Sodium Lactate, Lilly) assure sufficient alkali therapy Each preparation contains 1 66 Gm of sodium lactate per 5 cc. (one average teaspoonful)

The recommended average adult dose of sulfadiazine or sulfathiazole is 6 grams in twenty-four hours. Two teaspoonfuls Lacto-Diazine or 'Lacto-Thiazole every four hours provide the average adult dose of either drug and approximately 20 grams of sodium lactate for alkalinization. This is equivalent to the alkalinization produced by approximately 15 grams of sodium bicarbonate.

Lacto-Diazine and Lacto-Thiazole are pleasantly flavored, well tolerated With infants and children, dosage is according to body weight

Lacto-Diazine and Lacto-Thiazole are available in one-pint bottles

Plain Talk, III

Right now is a good time to do some in tensive thinking. This country, the USA, is assuming responsibility for large loans to European nations. It is supporting itself and pouring foodstuffs, clothing, and other aid into Europe, Asia, and the Middle East. The result necessarily will be increased living costs in this country as long as the laws of gravity and supply and demand remain operative twenty-four hours a day. One may have his cake and eat it, too, only in Utopia

The profession of medicine at least since it has been on a sound scientific basis, has been taught to be realistic. It has been realistic with relation to the art and science of medicine, and is now. But the profession lives as a minority group within the larger body politic and is subject to the fluctuations of the national economy. It will be in creasingly subject to political pressures as living costs rise as they must. Cheaper medical care will be sought by the tax-ridden public and will be dangled before the voters, in the form of government-controlled medicine by politicians seeking re-election.

Bismarck in Germany started the game Lloyd George in England played it after World War I. Mr I Falk in the Bureau of Research and Statistics in the Social Security Board has been urging it on this country for years Organized medicine in the United States has been under political attack as a "softening up ' preliminary since 1933, and such media as the medical and hospital provisions of the W M-D bills have been used in Congressional committee hearings heavily weighted in favor of socialized medicine to propagate the idea through publicity Federal "health workshops' sponsored by the U.S.P.H.S were used as propaganda media in support of the National Health Program of 1946

A little of the realism displayed by individual medical men in carrying on their science and art of medicine in studying this politico-conomic disease of propaganditis seems in dicated. The A M A and the various state and county medical societies have been studying it exhaustively and have furnished individual medical men with factual studies.

reports, and suggestions that individual doctors familiarize themslves with the seriousness of the situation

To those who consider the plight of the nations in Europe which have adopted tax-paid, government-controlled medical service, it must be apparent that *propaganda* for the adoption of such measures is an early symptom of the disorder of national bankruptcy, and that acceptance of the scheme is the dis-

ease itself. All Europe has it. We here are in the propaganda-for-state-medicine state as yet. It is a warning that with inflation, rising prices, and the febrile hysteria of an election year coming on, the easiest political nostrum to offer to the public would be cheap state medicine. Doctors will not be fooled. They will recognize it for the bankruptcy it really is, whatever you may choose to call it.

Inflation and Medical Costs

Some say we shall have inflation, others say not necessarily, still others say we have it now. To doctors this is apt to be confusing. After all, their job is to care for the sick and the question of inflation has a bearing on how they shall do it.

In 1948, political campaigns may be expected to produce possibly more than the usual election year quota of weird schemes to cure rising costs of living. These schemes, of course, will touch upon medical care. Our esteemed contemporary, the Saturday Evening Post, says, editorially, in part ¹

Despite the differences in detail, all these electoral squirmings have one common factor-namely, the disposition of peoples the world over to expect too much of politicians in The fault, of dealing with economic events course, is with the politicians, who have resorted to the most preposterous quackery to persuade the public that their snake oil would cure anything from inflation to the housing shortage Governments everywhere have undertaken to carry out nonfulfillable promises by plunging into the economic field and making a horrible mess of things This was prophesied almost a century ago by John Stuart Mill in his monumental Essay on Liberty, wherein he

"The public, expecting everything to be done for them by the state, or at least to do nothing for themselves without asking from the state not only leave to do it but even how it is to be done, naturally hold the state responsible for all evil that befalls them"

It seems useless to belabor the politicians, as the *Post* points out, they cannot perform economic miracles On the other hand, they

cannot stand around and let things drift along Inaction in the presence of rising costs of everything from shoe laces to medical care is no way to please the customers in an election year. The boys with the ballots want action and plenty of it. So the politicos give and hope for the best

However, (continues the *Post*) instead of concluding that the state is out of place in fixing prices or building houses, the voters are more likely to blame the political party in power and to install some other political party. The successful faction, instead of interpreting its success as a directive to let nature take its course for a few minutes, usually introduces some quackery of its own, explaining the failure of its opponents as due, not to quackery per se, but to the wrong brand of quackery Thus, unless common sense comes to the rescue, there develops a contest between charlatans which can end only in some sort of totalitarian seizure of power

The outlook seems grim, but there is a loophole—that common sense which the Post invokes. It has survived assorted disasters, election promises, prohibition, and numerous booms and depressions. We believe it will come to the fore now if given the opportunity.

Of course this country cannot escape the economic consequences of the recent war, nor can it or should it evade the issue of its postwar commitments to the less fortunate people of the world That is common sense

If such common sense results in higher prices here, that is to be expected, we can't have our cake and eat it, too Nor can we require the politicians to pull economic

¹ December 13, 1947, p 156

rabbits out of their hats But it is hoped that in the forthcoming turmoil of debate our American system of medical practice will not suffer the fate that befell the profession in England after World War I

We haven't a doubt that socialization of medical practice will be proposed seriously as a measure of economy, but we reiterate our belief that the common sense of the American people will reject such a measure on the ground that, though it would spread the costs of medical service without question, it would add servicely to the total costs and so dilute the service as to make it, in the long run uneconomical and distasteful to the people of the nation

Unlawful Practice of Medicine In the Court of Special Sessions in the City of New York recently a man was convicted and sentenced by the presiding justice The charge was the unlawful practice of medicine Certain of the remarks of the presiding justice as excerpted from the

minutes are of interest

"This case," he said, "has given the court a great deal of concern. Your counsel has seen fit (and properly so) to refer to the fact that a large number of letters have been received from all parts of the country in your behalf. I am afraid that a great number of those who wrote letters are acting under a very serious misapprehension. They seem to believe that the judges are the makers of the law, that it is up to the judges to approve the work that you did

That is not our function at all We didn't institute this proceeding. It was instituted by the duly authorized proper official, the State Attorney General, who brought the case before this court, which has jurisdiction, and you came on for trial and witnesses were called to the stand and, after being sworn, they gave testimony which this court has declared to be over whelming in substantiating the charge that you practiced medicine without a license. That is how simple it is

"This court doesn't make the rules with regard to the permission of men to practice medicine. That is done by the State Legislature. A man may be a very, very keen personality and feel that he can plead the cause of the downtrodden and the in digent, or the unlettered, or the untutored, but unless he passes the bar examination and is admitted to practice, he has no right to plead. Not that he might not be an ideal practitioner if he fulfilled the legal requirements. Very often that happens to be the case.

"So, you see, it is not our province to pass on naturopathy or chiropractic practices. That is not our function at all Whether we like it or whether we don't like it is beside the issue. We merely have to apply the laws that have been laid down. That is the function of a judge. The moment he begins to give vent to his own personal feelings, in my humble opinion, he is no longer a judicial officer. Let him go to the Legislature.

"Now, if there is something wrong with the legislative enactment with regard to the practicing of medicine in this state, the place to cure it is in Albany Until there is a law giving sanction to what you did, what you did becomes violative of the law as it

now exists

'I go back again to these letters for just a brief comment Frankly, you caused a notice to be sent out to your friends and to your acquaintances I don't think there is anything reprehensible about doing that When a man is in trouble, he has a right to call on all and sundry to come forward and testify either in person or by some other method of communication, on the behalf of the man who is in trouble. Those letters have been most laudatory, in the main But on the other hand, there have come letters that you did not solicit, which reprimand you, which condemn you, which blame you for ill health, suffering, and unhappiness We can't judge, therefore, on letters

'You may have treated people whom, by virtue of your personality you have been able to impress, and so they come forward at this time to help you But there have been other people who claim that when they came to you with a serious allment your treatment resulted in their almost annihilation. There is no proof of these things, so we are not going to give them

The man who wrote against you is not before us as a witness The man who wrote in your favor is not before us as a And so, while in numbers those who wrote in your favor outweigh those who didn't, the letters condemning you are strong in their very content—dates, doctors involved, x-rays ready to be submitted, things of that kind

"You have been subjected to the same treatment as any other defendant convicted after a trial. An investigation has The judges didn't participate been had in the investigation. It was done by the same probation officers who take care of all

cases coming to this court

"And what do we find upon reading the report? We find that, in truth and in fact, you have set yourself up above the law You are so convinced about your own powers, and your own right to carry on in the fashion that you choose, that you have decided that you can snap your fingers at the law and let it go at that The law says you mustn't use a stethoscope You did The law says you mustn't make the examination which the record reveals you did, but you did

The defendant had had a record of three previous arrests charged with practicing medicine without a license (At a previous trial the presiding judge had warned the defendant "You must desist from practices which have not the blessing, if you wish to call it that, of the law, in other words, practices which at the present time are declared illegal That is one absolute Then, having that in mind and including that as part of the sentence in the way in which I shall point out, the sentence of the court is that you pay a fine of \$500 and that you be imprisoned in the Monroe County Penitentiary for a period of six months Since this is your first offense—the first conviction and, so far as I am concerned, the first offense—I am impelled to a hope that I am using some leniency when I suspend the operation of the penitentiary sentence, but that is only in the belief and upon the express instruction that you desist from the unlawful practice of medicine That is all "

(In spite of lemency previously shown to him by the former court, the defendant persisted in carrying on his illegal practices)

Continued the presiding justice "Now you chose to disregard that injunction don't know the judge who said it, but that is what the police record reveals You chose

to continue what the law condemns you were hailed into this court and we found

you guilty

"The task of sentencing any man is the most unpleasant feature of this entire court's function It isn't easy It takes great deal of responsibility, worry, aggravation, fretting We don't eat our lunches any better when a man goes to jail We have to be mindful of the fact that while he has done wrong, he is not totally wrong. there are some good things about him And there are some good things about you

"We are here, however, to uphold the law and to protect the public. The public has a right to say What are you there for? The law was pointed out to you judges as on the This man has been convicted bebooks fore He saw fit to disregard the injunction of the judge Who are you (the public would have a perfect right to say) to disregard that history? And so, you see, it isn't a matter of our choice. It is a matter

of our duty "The law says, when a person is dying, the only one that the law allows to touch that person, diagnose or treat that person, is a licensed physician The record shows that medical science can't cope with every problem They have much yet to learn But the law says, at least they have the required courses of study, they have made themselves ready to practice the art of medicine, and the law says Do with this dying person as best you know how, but you, the licensed doctor, shall be the only one

"Now, the law never intended that that dying person should go to you or be allowed to be treated by you If that were the law, we would have dismissed the charge law says you can't do it, and you mustn't And I tell you again, it is the Legislature that has made that law, not the

judges

"By a majority of the court the defendant is sentenced to the New York City Penitentiary for a period of one year I dissent and vote six months in the workhouse"

We quote extensively from the record in this case to illustrate some of the difficulties in obtaining a verdict of guilty on what seems to be a simple matter of proving that someone was practicing medicine without a license

In this instance the defendant had been previously warned to desist, had been fined \$500, and had had his jail sentence suspended Yet he continued, in spite of lemency shown him, to break the law

sentencing by the presiding justice is such a masterpiece of clear statement that every member of the Society is urged to read it carefully

A.M.A President Looks Ahead In his opening address President Edward L Bortz, M.D., of Philadelphia told the House of Delegates of the American Medical Association at their recent meeting that "it is high time that organized medicine play a larger role in preparing the members of the profession and allied groups for rendering an emergency medical service in time of need

"The development of atomic energy as an industrial project," he said diately forces upon the medical profession the necessity of a clear understanding of the hazards which attend proximity to radioactive substances which are now being

claborated in great quantity

"An appreciation of these dangers and an understanding of protection against them, and also of management of casualties, represents one of the most important challenges

facing medicine

The AMA, president, urging wholehearted cooperation between the medical profession and the US Atomic Energy Commission, read a statement from Shields Warren, Interim Director, Division of Biology and Medicine US Atomic Energy Commission, The Washington, statement read

The increasing use of atomic energy and its outstanding peacetime products, the radioactive isotopes, are the most important developments in research since the inven tion of the microscope They promise to unfold new technics that will demand the highest degree of scientific imagination and skill for full exploitation The responsi bility of the medical profession for the full and prompt exploration of the new fields is clear and pressing

As in any new field, hazards as well as benefits exist, potential dangers to investi gators their patients, and the general public from the use of radioactive isotopes dictate that the medical profession is also respon able for the prevention and recognition of

these dangers

'The unprecedented scale of durangements that would result from an atomic ex plonon presents a new and vital responsi bility to the medical profession

medical organization to handle effectively these aspects of such explosion should be in existence and such plans should be at a con tinuing high level of readiness

"The Atomic Energy Commission is destrough that the medical profession shall explore all possible avenues by which the beneficial effect of atomic energy may be used to aid mankind, and that the medical profession shall take the necessary measures to protect mankind against radiation and other hazards which may exist in the field of atomic energy "

Dr Bortz in his report touched on vari ous activities of the American Medical Association which have been undertaken since the A.M.A centennial meeting in

Atlantic City last June

Dr Bortz said in part

While the physician today is a more effective agent in behalf of the health of his patients and in the support of public health measures than at all previous times in the history of our country, an additional re-sponsibility now must be assumed We must accept leadership for the consideration of various plans that will furnish acceptable medical care to those members of communities who are, for various reasons, at one time or another unable to meet completely the financial demands for such care No answer is yet available for all the variations of this problem In the meantime, the experimental method should be followed under local and controlled conditions Pilot studies can be carried on over a span of several years in communities as in labo-From time to time an accounting of accomplishments, and a reconsideration of detriments, should aid in the final solu-Obviously no one tion of the problem plan can be a solution for all portions of the population of our great nation | Flexibility and adjustment to community needs is in order

It should always be kept in mind that compulsion is an odious term, and taxation is not ordinarily interpreted as insurance In setting up any plan therefore, it is im portant that accurately descriptive terms should be employed by all concerned our Congress is in session it is our responsibility to see that the folks back home in struct their representatives concerning the importance of maintaining the democratic approach to the solution of our social prob Let s be awake to the challenge and find in it a means to a higher level of medical service

The President's Page

THE DUTIES of the President of the Medical Society of the State of New York require among other things, that the President attend each of the eight District Branch meetings

While in attendance at these meetings, I had an opportunity to speak with many of the officers and members of the various county societies, and one of the conclusions forced upon me as a result of these conversations is that each county society should, if it has not already done so, establish haison with various lay groups within the community. One of the best methods I know to accomplish this result would be for the president of each society to appoint a Committee on Public Education. The purpose of this committee would be to provide for the establishment by each county society of its own speakers' group, and thereby make available at all times a roster of doctors who are prepared to talk on subjects pertaining to medicine in any of its social, economic, or political aspects. These doctors should be prepared to speak either on their own initiative or at the request of any of the various lay groups within the community.

Public education is the most important single thing any county society can accomplish I can think of no better way in which the county society can achieve this than for the Committee on Public Education first to train and then make available speakers who can give our profession's views on such timely topics

We believe in the private practice of medicine as the proper way to deliver medical care. For certain aspects of medical care, public funds are available. If we are to protect the system of private medical care—if we are to insure proper allocation and administration of public funds—then the county society must provide leadership. Otherwise, the public will turn elsewhere for it

For these reasons, I believe the establishment of a Public Education Committee is most important. If this committee can find a number of adequately trained men who will go out and discuss these topics, the speakers will so establish the local county society in the minds of the public that the people, and as a consequence both State and local legislators, will automatically turn to the Society for the answer to any medical problem. Likewise, it will turn to it for help in finding a solution to any social, economic, or legislative question that touches upon our activities as members of the medical profession.

Should you desire any information or assistance in planning the creation of a Committee on Public Education and Speakers' Bureau, I suggest that you contact our field representative, Mr Thomas E Walsh, of the Public Relations Bureau at the State Society's office, 292 Madison Avenue, New York City 17

TRANSPLANTATION OF THE EXTENSOR CARPI LILNARIS TO GIVE ABDUCTION OF THE THUMB

MICHAEL BURMAN, M.D. New York City

(From The Hospital for Joint Discuses)

I HAVI devised an operation in which the tenplanted through the sheath of the abductor longus pollicis to give abduction to a thumb The kinetics of the thumb are analyzed to make the proper indication for this operation

Kinetics of the Normal Thumb

The normal thumb is balanced-balanced muscles moving joints, balanced by pairing The carpometacarpal joint pairs in movement of the thumb with the metacarpophalangeal joint (proximal pairing) and the latter joint with the interphalangeal joint (distal pairing)

The direction of movement of each joint of a pair 15 sımilar Try to oppose the thumb when the metacarpophalangeal joint is extended nor can the metacarpophalangeal joint of the opposed thumb be fully extended. This dissociation of joint motion is noted in the spastic thumb

The range of movement is not equal in each joint of a pair The metacarpophalangeal joint which interlocks each pair has a losser range of motion than either the interphalangeal or carpo-

metacarpal joints

Fixation of one joint of a pair limits motion of its mate. Stabilize with your fingers the carpometacurpal joint of the thumb and see how little motion is allowed in the metacarpophalangeal joint. Hold the metacarpophalangeal joint The movement of the interphalangeal and carpometacarpal joints is less. So, too is metacarpophalangeal joint motion restricted when the inter phalangeal joint is held (Pairing motion is lost when one joint of a pair is stiff or when its motor (the tendon or muscle moving it) is gone strain the active joint by hand or splint after the reconstructive measures of arthroplasty or tenoplasty to give the handicapped joint chance to regain commensurate motion)

The proximal pair of joints serves lateral movement of the thumb the distal pair the movement of flexion-extension of the thumb

The carpometacarnal and metacarpophalangeal loints pair in opposition as they do in the opposite

Presented at the 141st Annual Meeting of the Medical Fociety of the Stat of New York Buffalo Feetlen on Ortho-pedic Surgery May 8 1947

inovement of extrinsic abduction 1. When the finger or thumb moves by muscles whose origin and insertion begin and end in the hand, such power is intrinsic. If the muscle begins in the forcarm and ends in the hand or its digits it is an extrinsic muscle giving extrinsic power Adduction of the thumb in the plane of the hand by pull of the oblique and transverse adductors (intrinsic adduction) is balanced by the extrinue long abductor and short extensor of the thumb The extensor longus pollicis is an adductor of the normal thumb

Abduction of the thumb is antigravitational adduction gravitational The greater range of motion in either abduction or adduction is in the corponetacarpal joint, an active movement in abduction and a passive one in adduction Lateral motion of the metacarpophalangeal ioint is very slight, and the extended thumb moves as a rod when the first metacarnal is Adduction of the flexed thumb is adducted namful and restricted so too is extrinsic ab-The balancing movement to opposition or adduction of the thumb is abduction When the thumb is brought into abduction from adduction the long abductor contracts a little more strongly than the short extensor in the beginning of movement Similarly power of the short extensor is a little greater when the opposed thumb is brought out of the

The abductor longus policis and extensor brevis pollicis lie in the same sheath. One can not move without the other (synchrony of action) The tendons and at different levels to make pairing of the carpometacarpal and metacarpophalungeal joints mandatory Metacarpopha langeal joint motion is balanced by proportionate power between the flexor brevis pollicis and the extensor brevis pollicis while the interphalangeal joint is moved by the flexor longus pollicis and the extensor longus pollicis. The metacarpophalangeal and interphalangeal joints pair for effective flexion or extension of the thumb Thus, there are four groups of balanced muscles in the thumb powering two systems of paired joints

Wrist Position and Function of the Thumb

As there is a position of the wrist in its slight dorsifiction in which finger power is strongest, so is there a similar position of the wrist for most efficient use of the thumb. The use of the thumb is good when the wrist is neither ulnarly nor radially deviated. The long abductor is stretched in adduction of the wrist and is shortened when the wrist is abducted. Effective abduction of the thumb, however, is least in this latter position of the wrist. My right thumb can be abducted 7 inches in the neutral position of the wrist, 6 inches in ulnar adduction, and 5½ inches in radial abduction.

Opposition of the thumb is good in the wrist which is balanced laterally. It is not good in the radially abducted wrist, because the shortened long abductor tendon stops the thumb from entering the palm. Opposition is excessive in the adducted wrist. Similar observations are made in the use of the thumb when the wrist is placed in excessive volar flexion or dorsiflexion, the anteroposterior relation of the wrist to the thumb as compared with the lateral relation. The most useful position of the wrist is the Jones position of mild dorsiflexion.

In volar flexion of the wrist the thumb opposes and abduction is poor, because the insertion of the long abductor tendon is placed more volarly. In dorsiflexion of the wrist heyond the neutral position, opposition of the thumb is poor, and abduction of the thumb is favored, since the tendon insertion is placed more dorsally.

The obiquity of the scaphoid makes wrist movement oblique. When the wrist flexes volarly, it adducts at the same time, or when it dorsifieres, it abducts a little. Therefore, in a dyskinetic situation, volar flexion deformity and ulnar adduction deformity of the wrist are associated, the thumb falling into the palm to favor its opposition and hinder its abduction. The reverse deformity is uncommon.

The neutral position of the wrist gives best use of fingers and thumb The thumb (or fingers) should not be operated until the neutral position of the wrist is assured

Case 1—A Bunnell operation was performed to overcome the paralytic flat thumb of a twenty-seven year-old man. The wrist showed fair power with dominance of the radial extensors, so that fusion of the wrist was not advised. An opposition contracture following operation was slowly resolved by exercise. He could form an "O" and hold a small marble with thumb and index finger, but the dorsifiexion and abduction position of the wrist did not allow a more powerful use of the thumb

Kinetic Disturbances of the Thumb

The use of the thumb is changed when its muscle or joint balance is broken by any one of the four acquired forms of hand disability traumatic, arthritic, spastic, and paralytic deformities "3

The intrinsic and extrinsic deformities of the thumb are caused by disability in the distal pairing system of joints. In the intrinsic deformity, the thumb is flexed at the metacarpophalangeal joint and extended at the interphalangeal joint. The thumb usually is opposed, since the carpometacarpal joint moves with its fellow joint. The extrinsic deformity is the reverse deformity the metacarpophalangeal joint is extended, the interphalangeal joint flexed, and the carpometacarpal joint abducted.

The deformities of the proximal carpometacarpal and metacarpophalangeal joint system are twofold, based on disturbance in the relation between opposition and abduction, and between adduction and abduction. When the thumb is held adducted in the plane of the hand by contracture (abduction contracture of the thumb), as it often is in all the groupings of hand disability, abduction spread of the thumb and opposition are limited. The contracture is released by stripping of the first dorsal interosseous muscle and section of the combined tendons of insertion of the adductores transversus and obliquius muscles.

Opposition position of the thumb is due to an imbalance of power in favor of the thenar muscles. It is seen in the spastic hand and often in the hand of Erb's palsy. Opposition contracture is uncommon, although I have seen it in the hand of Volkmann's contracture and after the Bunnell operation.

The effort to abduct the thumb by compensatory extensor longus pollicis action is concentrated either on the metacarpophalangeal joint or the interphalangeal joint. A hyperextension deformity of the metacarpophalangeal joint with volar subluxation of the metacarpal head is often seen in the spastic hand. The movement of abduction after the transplantation of the extensor carpi ulnaris may be assisted by this overaction of the long thumb extensor.

Deformity in opposition of the thumb is sometimes associated with an adduction contracture in a plane forward to the hand. The release of deformity may require combined adductor release and thenar stripping. The reverse deformity, usually a paralytic one, is the abduction contracture of the thumb (flat hand deformity) for which opposition-giving operations have been devised, notably, the Bunnell procedure

Transplantation of the Extensor Carpi Ulnaris Muscle

No satisfactory operation to abduct the thumb seems to have been devised. Don'd noted that Hoffa shortened the extensor longus politicis This operation is comparable to the tendon transplantation of Biesalski and Mayer in which the extensor indicis propries is attached to the long extensor of the thumb Hoffa transplanted the flexor carpi radialis to the extensor longus pollicis to secure active abduction of the thumb and for the same purpose shifted this tendon to the abductor pollicis longus together with one half of the extensor carps radialis

Foerster and, later, bilfverskiöld performed a tenomyotomy of the muscles terminating on the ulnur sesumoid of the thumb, or a myotomy of the opponent policis. The adductors seem to have been cut also. This operation is comparable to the operation of thenar stripping which I described in 1938:

The transplantation of the extensor carpi ulnaria supplements adductor release and thenar muscle stripping operations which only lessen deformity. It is a positive operation since it gives extrinsic abduction to a thumb which has none. (This muscle also may replace the other oblique muscles of the dorsal part of the forearm)

The replacement of the long abductor of the thumb is needed to restore kinetic balance The thumb may now be withdrawn from the palm to allow grasping and the replacement sta bilizes the base of the thumb to give better oppo-Pition

The operation is performed under tourniquet control, using the pneumatic tourniquet or blood pressure cuff about the arm An Esmarch bandage around the ficshy part of the forearm should not be used, for the forearm is often short as it is in Erbs palsy The Lemarch handage blocks the proximal freeing of the

extensor carpi ulnarıs muscle

The first longitudinal meision which is I inch long with the base of the first metacarpal at its center exposes the long abductor tendon at its inscrtion The tendon is split in the line of its fibers. A trap door of bone is lifted from the base of the first metacarpal bone and the leaf of bone turned back distally (Fig. 1) The second long. tudinal incision begins mut distal to the base of the fifth metacarpal bone (the insertion of the ex tensor carpi ulnaris tendon) and runs along the course of the muscle The tendon may lie more ulnarly, since the wrist is usually adducted and volarly flexed The tuberosity of the fifth meta carpal bone should be used as a guide so as not to mistake the thinner extensor tendon of the fifth finger for the extensor carpiulnaris tendon (Fig 2)

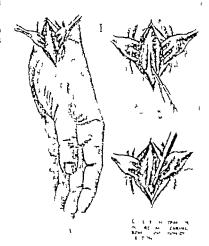

Fig 1

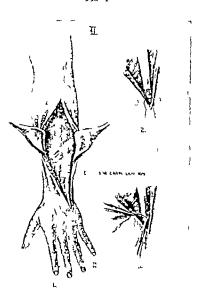

Fig 2

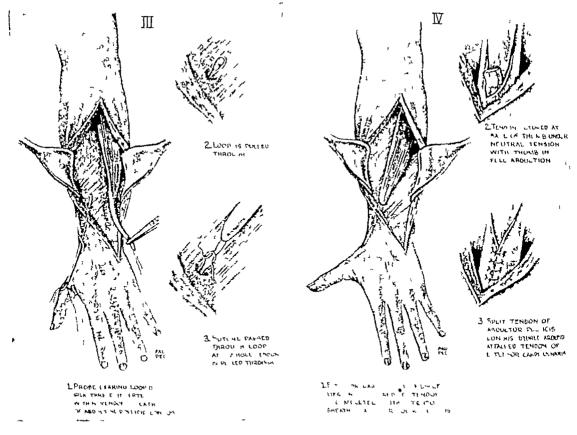

Fig 3

A loop of black silk is then passed through the sheath of the long abductor tendon from below with the eye of a small probe carrying the loop. The probe with the loop emerges through the fascia at the proximal pole of the sheath. This opening is enlarged to a diameter of one-half inch to allow the later passage of the transplant. The probe is withdrawn, leaving the loop in place proximally.

The insertion of the extensor carpi ulnaris tendon is freed by a transverse incision and the fixation suture passed through it. The tendon end is made conical. The tendon is freed along its full length with enough of the muscle belly being dissected free to give a straight line of pull (Fig. 3).

The tendon is transplanted by using the silk loop to pull it through the sheath of the abductor longus pollicis. The conical tendon end is fed into the hole made in the fascia. Since the space through which it passes is small, it is sometimes difficult to pass the tendon, especially, if the adjacent tissues have been scarred by previous operation. The passage of the long peroneal tendon is made more easily in the foot, since there is much more room in the sheath of the

Fig 4

tibialis anticus The tendon is passed without twist and is anchored under neutral tension beneath the bone flap in the first metacarpal bone, the thumb being held in wide abduction in the plane of the hand (Fig. 4)

The transplant is just long enough to reach to the base of the first metacarpal. In only one case was it too short, the Esmarch bandage stopping the further proximal freeing of the muscle belly of the extensor carpi ulnaris, the transplanted tendon was sutured, therefore, to the tendon of the long abductor just below the radial styloid.

The muscle belly of the transplant is subcutaneously placed and lies on the outer surface of the deep fascia. Its tendon is entirely intrathecal, so that it is unnecessary to construct a gliding surface as Mayer does in the peroneal transplant. The muscle should not be passed under the fascia

The fixation suture is either silk or No 1 chromic catgut. The two strands are passed through the eye of a heavy, short, curved needle and the suture taken through the bone at the base of the trap door. The two threads are tied to each other over the bone flap. Three

other interrupted sutures are taken between the split halves of the abductor tendon and the trinsplant. The long wound in the forcarm is closed before the transplant is anchored.

The thumb is immobilized by plaster in abduction for three weeks when physical therapy which should include sinusoidal stimulation of

the transplant is begun

This operation alone may be performed or it may be performed in conjunction with osteolomy of the radius to overcome supination contracture of the forearm or fusion of the wrist. The loop should be passed through the sheath before the bony operation. A window is cut in the plaster three weeks after operation to stimulate the transplant.

The extensor carpi ulnams was transplanted in one case to give power to the paralyzed extensor policis longus. It was passed through the sheath of this tendon and sutured to it below the level of the winst since the transplant is too short to reach the distal phalanx of the thumb

I did not suture the transplant to the short extensor tendon deliberately, although I probably did it inadvertenth. Do it if the thenar muscles are strong in order to avoid that dissociated position of the thumb in which the metacarpal is abducted and the thumb is in the intrinsic position

Use of Transplant

The use of this transplant in the four groupings is now described

A differentiation should be made between the stretched abductor and the palsied abductor of the thumb

The wrist flexes volarly and adducts ulnarly when the extensores carpi radialis longior and brevior are paralyzed, as they may be in spastic or infantile paralysis. The abductor longus pollicis cannot abduct the thumb because it is stretched. The thumb shows an adduction contracture in a plane a little forward to the palm if the thenar muscles draw it into the palm or a flat hand deformity if the thenar muscles are paralyzed.

The extensor carpi ulnars is not transplanted to a stretched abductor longus policis. It is attached to the radial extensor tendens of the wrist to give it lateral balance if the patient is too young for a wrist fusion.

The Spastic Hand—The thumb of the spastic hand is drawn into the paim. The abductor longus pollicis is either stretched or paralyzed. The extensor carpi ulnaris is used to replace the paralyzed abductor longus pollicis. A stripping of the thenar museles or adductor section should be performed at the same time to overcome contracture.

Case 2—(Abductor palsy in a spasiic hand)—A girl of thirteen with a right-sided homiplegia had a pronated forearm with the wrist volarly flexed and adducted and the thumb indrawn. There was a moderate degree of plastic muscle rigidity.

Fusion of the wrist using a tibial bone graft was performed on March 5 1915 Release of the spantic adduction contracture of the thumb and intrasheath transplantation of the extensor carpi ulnaris

tendon were performed on July 8, 1945

She is able to keep the thumb out of the palm and to hold things between thumb and fingers. The period of postoperative observation is a year and a half. The girl and her mother are well satisfied. She still hyperectends the thumb at the metacarpo-phalangeal joint as she did before the operation a substitutionary motion which helps the transplant.

Case 3—(Abductor stretching by palsy of the radial extensors of the terrist)—A boy soven years old had a left hemplegia in which the left wrist was deviated uliarly and bent volarly by paralysis of the radial extensors. The indrawn thumb was held in mild adduction contracture. It could not be abducted although the long abductor had some strength, Finger power in extension and flexion was good. The procedures indicated were the release of the adduction contracture the stripping of the thenar muscles and the transplantation of the extensor carpi uliaris tendon to the extensor carpi radialis longor and brevior tendons.

The Paralytic Hand—There are two types of paralyted hands which come under this heading the hand of infantile paralysis and the hand of Erb's palsy

The hand of infantile paralysis has the thumb lying in the plane of the hand (flat hand) through the action of the intact long abductor, for the thenar muscles are paralysed

The indication is not the replacement of the long abductor but the replacement of thenner muscle power. This is done by the Bunnel operation using the flexor carpi ulnaris muscle as the motor. There are other operations such as those devised by Steindler Royle Ney etc., which are sometimes used. Capsulotomy of the carpometacarpal joint with or without adductor muscle section, or rotational esteotomy of the bone of the first metacarpal is done at the same time as the Bunnell operation to give free passive opposition of the thumb

This is the usual state of things. The more unusual situations, such as paralysis of all thumb muscles paralytic club ulnar hand and indrawn thumb demand special procedures to give stability of the thumb.

If all the thumb muscles are paralyzed a bone strut operation is performed the piece of bone being placed between the first and second metacarpal bones so that the thumb is held in the neutral or relaxed position. Case 4—A transverse bonc strut was placed between the first and second metacarpals of the paralytic right hand of a girl of seventeen on September 7, 1944—The only power in the hand was that in the flevor sublimis of the ring finger—It was felt that the use of the tendon to give opposition of the thumb was unwise—The reverse procedure seemed better—to place the thumb for grasping and to bring the ring finger to the thumb

The strut operation was a final operation on the hand rather than an initial one. A fusion of the wrist had been done on November 29, 1943, and a flevor plasty of the elbow on February 7, 1944. The strut operation was followed by arthrodesis of the shoulder on September 26, 1944.

She has been observed for more than two years. The bone strut holds the thumb in excellent position, and she can hold an object between the rigid thumb and the movable fourth finger, which is the expected result.

'Paralytic ulnar club hand is caused by a weakness or absence of the radial extensors of the wrist with dominant power in the flevor and extensor carpi ulnaies muscles. The long abductor tendon is stretched

The wrist is stiffened so that it is placed in neutral position, and the thumb is then balanced. The extensor carpi ulnaris tendon is used to reinforce the radial extensors of the wrist if the patient is too young to stiffen the wrist.

Case 5—A boy of eight with a severe paralytic deformity of the left upper extremity showed, as one of the deformities, a great ulnar deviation (to an angle of 70 degrees) of the volarly bent wrist. The fingers were clawed and the thumb flat. The extensor carpi radialis and flevor carpi radialis muscles were quite weak.

The extensor carpi ulnaris tendon was transplanted subcutaneously on March 31, 1937, to the two radial extensors of the wrist. This operation was a substitute for wrist fusion

The angle of ulnar deviation was reduced from 70 degrees to 20 degrees by the extensor carpi ulnaris transplant. The unsuccessful use of the flexor carpi ulnaris as the motor (operation on October 14, 1938) to give opposition of the thumb further lessened ulnar deviation of the wrist.

The tendon of the flevor carpi ulnaris was attached to the distal and of the tendons of the extensor brivis pollicis and abductor longus pollicis which were divided about 1 inch above the wrist. The abductor was rated, according to the Boston system, as 3 before operation, for it was able to contract against gravity. The tendon of the short extensor was very small, being scarcely thicker than a thread, while the abductor tendon had good substance. The thumb fell quickly into the flat hand position by the action of gravity, even though the long abductor tendon had been cut. (It is wrong to use the stabilizing abductor as the transplant in the Bunnell procedure)

The patient could dorsifles the wrist actively on

February 11, 1945, but still had tendency to ulnar deviation of the wrist

There is also the very rare situation in which the thumb is indrawn by thenar power and the long abductor of the thumb is absent

Case 6—A man of thirty-four had a fial left arm. The posture of the extremity was unusual. The shoulder was internally rotated 90 degrees and abducted about 20 degrees. The elbow was held at 160 degrees. The forearm was hyperpronated to 135 degrees, the wrist volarly flexed and adducted ulnarly. The thumb was indrawn, and the fingers held in extension contracture at the metacarpophalangeal joints (Fig. 5)

The thumb had slight power in the abductor brevis pollicis and possibly in the flevor brevis pollicis, while the little finger had power in the abductor digiti quinti brevis. The only finger motion was strong (sublimis) flevion of the index finger. He could hyperpronate actively a little when the forearm was held at 100 degrees of pronation, and a muscle, presumably the brachioradialis, was seen moving on the dorsum of the forearm. Electrical muscle testing gave no response in the forearm musculature

The patient moved all the active muscles at the same time in a synergy which favored the develop-

Fig 5 Preoperative photograph October 21, 1946, showing hyperpronational deformity of the left forearm Thenar muscle power but no abductor power of his thumb (Case 6)

Fig. 6. A postoperative photograph (June, 1947) after a series of operative procedures which fused the left shoulder, derotated the forcurn, stiffened the wrist, and gave a little abduction power to the thumb by intrathecal transplantation of the radial extensors. The appearance of the extremity is good. He is able to hold an object between thumb and for finger ($Ca\omega$ 6)

ment of a hyperpronational deformity and the antigravitational deformity in this case, of ulnar adduction and volar flexion of the wrist. There was also direct relationship between the internal rotation contracture of the shoulder and the deformity of the forcarm in hyperproparation.

Operation was performed on November 11 1940: The index finger was manipulated to overcome the extension contracture of its metacarpophalangeal joint. The wrist was fused by the Abbott technic and the radius estectomized at its midpart by concentrotomy to bring the forearm into 90 degrees of pronation. The extensors carpi radialis brevior and longor were transplanted through the sheath of the long abductor of the thumb to give abduction to the thumb since their muscle bollies had pink enlared faseleuli.

The forcarm was derotated to 20 degrees of pronation on November 25–1946 into a position of function for the shoulder to be arthrodesed. This shoulber operation was performed on December 2, 1946.

When he was last seen in June 1947 the wrist and aboutder were well fused. The thumb was hold in abutetion in the plane of the hand and could be drawn in a little by weak thenar muscle power. He could hold a package of cigarettes between thumb and index finger (Fig. 6)

In the hand of Erbs palsy a different kinetic attaction is seen, especially when the disability is associated with the not infrequently seen par

alytic supination contracture of this malady.
The forearm is supinated. The wrist is doral flexed and ulnarly adducted by gravity and by paralysis of the wrist flexors. The thumb is in drawn. The elbow is flexed, the shoulder in ternally rotated and somotimes alklueted. The contracture is due to the selective paralysis of the muscles arising from the internal epicondyle of the humerus. This study of supination contracture will be reported later in detail.

The wrist is ulnerly adducted by an extensor carpi ulner is muscle whose strength is below normal since it too is affected by the palsy. There is no power in the flexor carpi ulners. The long abductor of the thumb is paralyzed.

The extensor longus policis is sometimes paralyzed and the distal joint of the thumb is flexed if the flexor longus policis has power

There is a significant difference in the behavior of the thumb in infantile paralysis and in Erb s palsy, which is abduction in the former and opposition in the latter

The problem here is the restoration of kinetic balance of the thumb. In Ech's palsy it means the restoration of abduction, using the extensor carp ulnaris muscle as the transplant. The operation is not a primary operation for it is usually combined with wrist fusion, and some-

Rotation of

times with osteotomy of the radius. It is the analogue of the triple arthrodesis of the foot with transplantation of the peroneus longus through the sheath of the tibialis anticus.

Before I devised this transplantation, the attempt had been made to solve this problem by suturing the paralytic tendon of the abductor longus policis to the active tendon of the extensor carpi radialis longior, somewhat as Hoffa did it ³

Case 7—This operation was performed on February 26, 1943, on a boy of eight with a left Erb's palsy. The hand was diffusely weak. The thenar muscles had fair bulk, but he could not oppose beyond the middle finger because of adduction contracture of the thumb, weakness of the long abduc-

the forearm was fairly strong and not restricted

The patient was seen last on November 8, 1945, when he did show fair power of the long abductor muscle but he could not yet oppose beyond the middle finger. The thumb could not be spread as much as the normal right thumb by mild adduction con-

tor, and weakness of the opponens

tracture The thumb tended to be dorsally placed
The patients in whom the extensor carpi
ulnaris was transplanted all had supination
contracture of the forearm

Case 8—Natable D, twenty-two years old, had a right Erb's palsy (Fig 7) At the age of four the

Fig 7 Preoperative photograph (February 2, 1945) to show the supination contracture of the fore-

right upper extremity of the patient was manipulated and immobilized in plaster, the shoulder being abducted 150 degrees and externally rotated, the elbow extended, and the forearm supinated. The airplane position is bad for any patient with supination contracture of the forearm or pronator weak-

ness The forearm should be held pronated
In July, 1940, when she was seventeen years old,
a wrist fusion and transplantation of the flevor earpi
ulnaris to the common extensors of the fingers was
performed by another surgeon

Osteotomy of the radius which pronated the forcarm and the extensor carpi ulnaris transplant were carried out on March 26, 1945. At the same time the elbow was manipulated into extension and the fingers flexed at the metacarpophalangeal joints to

The result is good (Fig. 8) She was seen peri-

odically until November, 1946 She can hold ob-

overcome their contracture in extension

pects in the right hand and can use it for knitting and sewing. The thumb can be abducted actively (Fig 9a and 9b). The forearm is held in the neutral position, for the transplant may also act as a supmator. The radius is bowed ulnarly.

Case 9—This patient, Naomi H, a fifteen-year-

old girl, had Erb's palsy (Fig. 10)

Osteotomy of the radius to correct supmation contracture of the forearm was performed on March 1, 1943. This osteotomy was revised on November 15, 1942, heavy and the contraction of the contraction when the contraction of t

Fig 8 Postoperative photograph (October 4, 1945) The forearm is now pronated but the radius to box ed ulnurly (Casa 8)

Fig. 9a. Photograph (October 9, 1946) showing active abduction of the thumb

fusion and the extensor carpi ulnaris transplantation were done on July 10, 1045

The patient has been followed for sixteen months and is quite pleased with the result of the operation. She can hold a small object between thumb and fingers, and can bring the thumb out of the palm by action of the transplant and the extensor longus pollucis (Fig. 11)

Case 10 - Harriet E was a girl of fifteen with left Erb's palsy

The left wrist was fused on July 28 1937 at the age of six, a common error in the treatment of suplnation contracture of the forearm

Osteotomy of the radius at its midpoint on March 6, 1944 and supracondy lar osteotomy of the hu

Fig 9b The patient holds a fountain pen in a natural manner

Fro 10 Preoperative view (July 4 1945) showing indrawing of the thumb (Case 9)

merus on March 20 1944 were then performed. On August 9 1944 esteolomy of the radius and ulna was carried out because of marked ulnar bowing of the radius and ulna.

Combined revision of the wrist fusion and extensor carpi ulnaris transplantation was done in July 1945. It was not possible to bring the tendion end to the base of the first metacarpal bone because an Esmarch bandage had been placed about the fleshypart of the short forearm. The tendion of the ex-

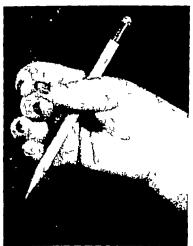

Fig 11 Postoperative view (March 16 1940) The thumb can be withdrawn from the palm and hold an object (Case 0)

tensor carpi ulnaris was attached to the tendon of the long abductor by several interrupted silk sutures, the adjacent sides of the two tendons being scarified

There was a subsequent admission for removal of a sequestrum on March 25, 1946 This sequestrum was derived from the partly necrotic cortical tibial graft, an occasional complication after this form (Albee) of wrist fusion

The appearance of the extremity two years after tendon transplantation is good. The patient stated that function of the hand had not greatly improved. She was able to hold several sheets of paper between the thumb and fingers. The thumb was kept out of the palm, and she could bring it to the radial side of the index finger, flexing the fingers at the same time. She could carry the thumb back with very slight transplant action being felt. The metacarpophalangeal joint of the thumb moved at the same time.

Case 11—This patient was a girl, twelve and a half years old, with a right Erb's palsy—Osteoclasis of the right forearm was performed on August 24, 1942, to correct the supination contracture after the method of Blount 7

Stripping of the collateral ligaments of the metacarpophalangeal joints to correct their extension contracture (Shaw operation) was done on August 23, 1943, after manipulation of these joints had failed

On November 12, 1945, osteotomy of the radius was performed to correct recurrent supmation contracture At the same time, an extensor carpi ulnaris transplantation was performed, the tendon being attached to the extensor pollicis longus tendon at the level of the wrist The reasons for this operation were, first, that the long abductor of the thumb had some power and, second, that the distal joint of the thumb was held fleved, because its long extensor The tendon of the extensor carpi was paralyzed ulnaris was passed through the sheath of the extensor longus pollicis, and the two tendons were sutured side by side at the level of the wrist

The results were good The period of follow-up

was one and a half years She can extend the tip of the thumb actively, but the thumb is held in the flat hand position by combined action of the long abductor tendon and the transplant The patient can hold objects between the thumb and fingers Opposition is possible to the middle finger

The arthritic hand and the hand disabled by injury rarely offer the problem of substitution indicated by this study. The extensor carpiulnaris may be used to replace a torn long abductor or long extensor of the thumb, as in the delayed frictional tears of these tendons after fracture of the radius.

Conclus on

The operative procedures for balancing the thumb are now made more complete by the addition of this tendon transplantation

The result of this operation is satisfactory. Our standard is relative and not absolute, since the transplant is usually weaker than normal. The result is good in the positive sense if the transplanted tendon is strong enough to keep the thumb out of the palm. In the negative sense, it is a tenodesing operation

The operation is a useful one and should become one of the standard tendon transfers

NEURO ALLERGY IN CHILDHOOD

T WOOD CLARKE, M D Utica New York

URING the past thirty-odd years since the first recognition of the relation of personal khosyncrasies to certain diseases and the birth of the science of allergy, the appreciation of the importance of the allergic diseases has steadily grown among the pediatrists internists and otolaryngologists Today, the pediatrist not equipped to make an allergie study, is timorous about treating a case of asthma hay fever hives. or erzema Some are now beginning to be aware that a large percentage of the children with snuffly colds, recurring bronchitis or intestinal cohe are as much allergic patients as are those with typical asthma. More and more pediatrists are including skin testing and the other procedures of the allergist's armamentarium in the course of their regular practice or are referring patients to the specialist in the allergic diseases

There is, however one group of allergic mani festations which is still not thoroughly appreci ated except by those who are devoting their attention largely or exclusively to the study of allergy This is the group showing symptoms caused by allergic reactions occurring in the cranial cavity involving cither the meninges or

the brain tussue

The three characteristic results of an allergic reaction are amouth muscle spasm, local edema and increased glandular secretion. If as a result of an allergic reaction muscular spasm occurs in the arteries of the brain, definite neurologic symptoms may be expected to follow Localized cerebral anemia may cause transient paralysis dizziness and many other symptoms familiar to the neurologist. Similarly sudden edema of the bram or meninges or increased secretion of cerebrospinal fluid can cause increased intracranial pressure and symptoms simulating meningitis or brain tumor A minnt urticana of the brain or meninges would produce symptoms strongly resembling cerebral tumor

The characteristic symptoms of increased intra cranial pressure are headache vomiting, disziness increasing blindness, paralysis and paresthesia convulsions, and psychotic changes in the mentality Each and every one of these has been seen in association with other manifestations of an allergic condition or has appeared alone as a manifestation of an allergic reaction in the cen tral nervous system

In the year 1927, the late Victor Vaughan

proved conclusively that one of the most com mon causes of migraine headaches was the ingestion of food against which the nationt had an allergic idiosynemsy, an observation confirmed by many others and now universally accepted by all aller ists and acknowledged by many neurologists 1 A feel years ago Goltman reported a case where a decompression operation was per formed on a young woman, suffering from migrame headaches in the belief that she had a brain tumor 2 A large flap of skull was removed and not replaced The patient continued to have the migraine attacks and whenever these occurred, the skin over the skull opening bulged so markedly that it could be seen from a distance of reveral feet When the bulging subsided the symptoms disappeared, and the opening remained depressed until the onset of the next mi graine attack.

There can be little doubt that many children who have nek headaches are really sufferers from cerebral allergy both headaches and vomiting being the direct result of increased intracranial pressure due to allergic edema of the brain Several authors too, have urged serious considera tion of the possibility that cyclic vomiting, that bugbear of the pediatrist, is also a manifestation of allergic intracramal edema. This is a theory well worthy of serious study

If the intracranial edema occurs in the neigh borhood of the optic nerve the resulting pressure may cause temporary reduction of vision or actual blindness with retinal swelling and choked disk the symptoms clearing rapidly with the withdrawal of the allergic reaction. If the local edema occurs in the region of the auditory nerve or the semicircular canals, the symptom complex known as Méniero a syndromo consisting of ring ing in the cars, deafners and dismness sometimes so marked that the patient falls to the ground. may occur These manifestations of intracranial pressure due to an allergic reaction are well recognized as occurring in adults. They should be kept in mind when similar unexplainable bisarre neurologic symptoms are seen in child hood

That severe attacks of pempheral neuritis. causing excruciating pain and local paralysis may occur as a result of cerebral or spinal cord edema produced by allergy has been proved by Foster Kennedy and confirmed by many writers 3 The most typical form of this is that resulting from serum sickness. This distressing complication has usually followed injection of tetanus

Presented at the 141 t Annual Meeting of the Medical Society of the State of New York Buffalo, Section on Pediatrice May 8 1947

antitovin but may be produced by any of the sera used for prophylaxis or treatment

The symptoms usually appear within twelve to twenty-four hours after the appearance of the urticaria of the seium sickness For some unknown reason it almost always involves the distribution of the fifth and sixth cervical nerves At first there is pain in the shoulders, so excruciating that it is not relieved even by large doses of This may last for several weeks After one or two days a weakness of the arm appears, followed by rapidly developing atrophy of the deltoid and at times of other muscles of the shoulder girdle, especially the supraspinatus and infraspinatus muscles The paralysis usually remains fairly complete for about three months, after which power gradually returns to the arm, the atrophy slowly disappears, and from six months to a year after the attack complete restoration of function of the arm has taken place In a small percentage of the cases, however. recovery is not complete and a partial paralysis remains permanently

Care should be taken to warn all patients to whom tetanus serum has been given that if they have pain in the shoulders to return at once Early treatment with epinephrine and intravenous injections of hypertonic sucrose or dextrose solutions are believed to reduce the edema at the nerve roots and to lessen the nerve damage

Kennedy and other authors have reported incidents of allergic cases, sometimes associated with asthma, migraine, or urticaria, and sometimes alone, with recurring attacks of local anesthesia or paresthesia of the hands followed by temporary paralysis, in which the symptoms disappeared promptly on the administration of adrenalin and could be prevented by eliminating from the diet the foods to which the patient was sensitive 4

The cause of infantile convulsions, unassociated with injury or disease of the central nervous system or with fever, has long been a puzzle to Teething, indisgestion, the medical profession overfeeding, and worms have been cited as the underlying factors This subject has been only touched upon in the literature on allergy, and no systematic allergic study has been made, although as far back as 1921, Thompson in London in a study of 200 cases of infantile convulsions stated that they were usually due to poisoning from milk, cereals, or eggs, the foods which are the most common factors in the production of allergic shock.5 In this report Thompson said "There can be little doubt that the interesting, and as yet only partially understood, process of anaphylaxis plays an essential part in the causation of some, and perhaps many, morbid phenomena" He believed that continuing the offending diet in children prone to infantile convulsions might lead to asthma, eczema, and possibly epilepsy in later life. From my own observations I am convinced that at least a certain number of cases of infantile convulsions are due to allergic reactions in the central nervous system.

Case 1—A number of years ago a child, twentythree months of age, was brought to me with a history of convulsions occurring several times a day for two months Physical examination failed to explain the convulsions Intestinal parasites were ruled out by stool examination and anthelminties Skin tests, however, gave positive reactions to apple, date, beef, celery, spinach, dog hair, feathers, flaxseed, and cotton During the two weeks in the hospital, while the tests were being made, the child had from 3 to 10 convulsions a day On the basis of the completed tests, cotton and feathers were removed from the environment and the offending proteins eliminated from the diet The convulsions ceased The child remained free from convulsions during the next ten days of observation in the hospital and has had no recurrence since that time

The few allergists who have mentioned infantile convulsions in their writings have been very conservative in expressing any opinion on the subject, although some have stated the belief that if more attention were paid to the possibility of infantile convulsions being of allergic origin, a certain number of individuals who had convulsions in childhood might be protected against epilepsy in later life. Where there is a family or personal history of allergy, the possibility of unexplainable convulsions in any child or infant being allergic in origin should be given careful consideration.

With the single exception of migraine, epilepsy has received more attention from allergists during the past score of years than any other manifestations of allergy of the central nervous system. While the disease has been known since the earliest days and has been studied by thousands of investigators, the medical profession knows little more about the cause of epilepsy than it did in the days of Hippocrates. The one feature, common to all writings on the subject, is that in cases of epilepsy careful attention must be paid to the diet. The instructions as to diet have varied with each writer.

It is just a quarter century ago that Francis Ward called attention to the close relationship between allergy and certain cases of epilepsy in reporting the case of a girl, who, as an infant, had vomited all cows' milk, had infantile convulsions and attacks of petit mal, and from the ages of eight to fifteen had had numerous attacks of typical epilepsy ⁸ When it was found by skin testing that she was sensitive to milk, cheese, beef, and veal, and these were removed from her diet, the attacks stopped immediately

Many authors have reported convulsions due to allergy, some in association with other allergic manifestations as asthma or urticaria, some occurring alone with no other evidence of allergy but responding promptly to dictary regulation based on an allergic study. In 1937 Ward in association with Harold A Patterson skintested 1,000 epileptics at the Now Jersey State Village for Epileptics and at Craig Colony at Sonyea Now York, and found that 48 per cent of them responded to some allergen while only 8 per cent of a control group of 100 per cent were positive.

Since then, allergists all over the world have reported single cases or small groups of epileptics in whom the causative factor has been found to be an allergic sensitivity. In recent years the interest of some eminent neurologists notably Foster kennedy and Irving Paridee of New York, has been aroused by the relationship between allergy and epilepsy as well as other neurologic affections ^{1,4,8,9}. Both are now enthusiastic advocates of allergic investigations, not only of cases of epilepsy but of any neurologic symptom complex, the cause of which is not evident

Case 8-My interest in allergy as a cause of epilepsy started in 1931 when a ten year-old girl was referred to me The patient had had grand mal attacks for four years occurring twice a week recently In obtaining the history it was brought out that the child was also asthmatic An allergic study revealed sensitivities to cottonseed cattle hair radishes and cheese. These foods were removed from her diet but since she lived on a diary farm and cattle hair could not be climinated from her environment weekly inoculations with cattle hair were instituted and kept up for eight months. As the doses were increased not only was the asthma relieved but the epileptic seizures became less and less The last attack occurred in November frequent She has been quite well since then

Case 3 -Shortly thereafter a garl of sixteen came to me. She had had an egg intolerance as an infant, frequent colds, mucous colitis and hay fever the age of ten she had had epileptic convulnons varying from once a month to once in three months. Her allergic study demonstrated sensitivity to the fall pollens, numerous foods orris root, pyrethrum and tobacco She was given pollen injections and a rigid diet based on the allergic findings The result was that her mucous colitis cleared up and the next summer she was free from hay fever During the next three years that she was under observation she had but one mild convulsion which occurred when she was on a long automobile trip and eating at restaurants where she was unable to adhere to her dict."

Since that day I have examined many cases of chilepsy, including all those at both the Utica and Marcy State Hospitals where 75 per cent showed some ovidence of allergic sensitivity Short-handedness in the hospitals prevented following up these findings

In my private practice many cases of epilepsy have shown some evidence of an allergic sensitivity. Where this has been marked and where the patients were young most satisfactory results have occured. If the reactions were inconclusive and the epilepsy had contined for many years little benefit was obtained from any thera poutte efforts. Two recent cases have shown favorable results.

Case 4 —One (P B) is a boy of ten who came to no two years ago. It was an early case. In showed marked reactions to the dust from his home numerous molds, cat and dog hair and tobacco. His environment was regulated and inoculations commenced. His last convulsion was n June 1945.

Case 5 — Another girl (E. M.) a farmer's daughter came to my office in December 1944 with a history of epileptic attacks occurring from two to five times a day for two years. She showed sensitivity to cattle dogs horses and numerous molds. She received inoculations of the offending allergens and although not cured, in spite of the inability to remove her from her allergenic surroundings her attacks have been reduced from two to five a day to one or two attacks a month

It is a matter of common experience that the astlimatic child although amenable normally becomes irritable and disagreeable in the extreme during an asthmatic seizure. This nervous excitability is usually considered to be the result of the discomfort of the attack aggravating the child or of pampering by over-solicitous parents This is for the most part, true, but numerous cases have been reported by Shannon and other allergists in which high-strung, nervous unruly and disagreeable children who showed none of the accepted manifestations of allergy, have been found to be hypersensitive to certain foods, most commonly wheat 11 When the offending protems were removed from the diet these chil dren's mental attitudes toward life have changed and in a few weeks the spoiled irritable child has become happy contented and friendly

Case 6 —One such case came under my observa control way years ago. A boy of thirteen surly disobedient and willful had been expelled from four schools as an incorrigible pupil. His parents were at their wits' end as to what to do for him. Hearing that I was interested in child psychology they brought him to me to see whether I could unravel his peculiar complex.

Since he was a sufferer from hay fever I did a complete allergy study on him and found him to be sensitive to several foods as well as to the fall pollens. The foods to which he reacted were removed from his diot. On his returning to school the family were astonished to learn that he got along well was happy in his scholastic work had joined the Boy

Scouts, and was getting on well with his fellow

After several weeks of treatment the parents discontinued the boy's visits and presumably gave up the treatment outlined. A year later, I learned from outside sources that the boy had again become incorrigible

Case 7—On October 14, 1945, a boy of fifteen years of age was referred to me by Dr Richard H Hutchings The boy's father suffers from hay fever His grandfather had asthma He had had eczema when an infant and, since then, frequent attacks of For the past three years he urticaria and asthma had had attacks resembling petit mal During the same periods he had had frequent violent temper attacks, appearing with or without provocation, in which he smashed dishes or anything else on which he could lay his hands Excessive amounts of homework were sure to produce such an attack attacks lasted about a half hour Then he quieted down and was remorseful about what he had done He remembered all the details of the attack. During the five weeks previous to his first visit to me he had had five such attacks

On the first day of testing he gave 4 plus reactions to oats and wheat These were removed from his Since then, he has had no outbreaks Whereas on his first visit he was sullen and uncooperative, he now seems happy and desirous of going through with the testing He is meticulous about coming for his weekly injection although he has to hurry through his paper route and then travel 10 miles to reach my office in time For the past year he has carried on heavy schoolwork and, during the summer of 1946, made a trip of 30 miles daily to attend summer school During the whole year and a half under observation he had has no outbreak of any kind His entire attitude toward life has changed

Case 8—Two years ago, Wilmot F Schneider, in discussing the hyperkinetic child, reported a case of a girl of ten years who was so overactive and unmanageable that, although she had an IQ of 139, she could not be handled at home and had to be sent to a special school and was admitted finally to a hospital ¹² Here, an allergy study was made, sensitivity to orris root, pollens, and dust were discovered, and treatment was commenced Within three months the uncontrollable problem child had quieted down and become so amenable "that the mother and father were unable to believe that this was the same girl"

No allergist suggests that all cases of headache, paralysis, convulsions, or psychic maladjustments are of allergic origin. We do, however, believe that some of them are, and that in every such case where the causative factor is obscure, the question of there being an allergic background should be given serious consideration. Our little patients deserve that much from us

7 COTPAGE PLACE

Discussion

Bret Ratner, M.D., New York City—I would emphasize one salient feature of Dr Clarke's thesis

and urge pediatricians to regard cerebral disturbances that are transitory in nature, and in which the causative factor is obscure, as perhaps allergic in character

Dr Clarke presents an excellent case for attributing these transitory cerebral manifestations to arteriolar spasms of the brain vessels and the concomitant edema. Perhaps, I can best emphasize the importance of his thesis and continue his discussion in concrete fashion by omitting from consideration migraine, histaminic cephalalgia, Ménière's syndrome, epilepsy, and infantile convulsions and by confining my remarks to a further analysis of the cerebrospinal effects occurring in serum sickness and serum allergy

The allergic manifestations, resulting from the parenteral injection of foreign serum, lend themselves to accurate appraisal. The time of entrance of the otherwise innocuous substance always can be ascertained, and the material is not too complicated for a study of the component substances, nor does it possess primary toxicity when properly prepared

Consideration of allergic encephalopathies from smallpox or rabies vaccines, drugs, and antibiotics are somewhat complicated because of the primary toxicity of drugs and antibiotics and the complexity of the viruses. One cannot be too certain whether the reaction is allergic or the result of such factors.

Having established the fact that neurologic allergic sequelae can follow from the entrance of an innocuous foreign serum into the body, this information may help us to appraise similar sequelae from the use of such substances as sulfonamides, penicillin, streptomycin, virus vaccines, and others

With growing knowledge, it is becoming evident that the brain, the meninges, the spinal roots, and the peripheral nerves may be the site of more or less severe allergic reactions. These sequelae, as a rule, subside, leaving few if any residua. Notwithstanding the many reports of such allergic episodes, they are relatively rare. If the frequent occurrence of headache, nausea, vomiting, and neuralgia in the usual and well-known type of serum disease constitute a syndrome of neurologic origin, then a mild form of allergy of the nervous system is frequent It is further possible that many of these neurologic complications have been entirely overlooked in other situations.

- I have differentiated three types of meningitis following serum injections—serum sickness meningitis, aseptic or serum meningitis, and allergic meningitis.
- (1) Serum sickness meningitis results from an extrathecal injection of serum and manifests itself during the course of ordinary generalized serum sickness and accelerated serum allergy. The spinal fluid shows a preponderance of lymphocytes
- (2) Aseptic or serum meningitis results from the primary contact of the meninges with the serum after intrathecal injection. It is nonallergic, and polymorphonuclear cells are predominant in the spinal fluid.
- (3) Allergic meningitis may be a sequence to intrathecal injection of serum in the case of an individual who has been sensitized by previous

expenence with the serum It also is characterized by a predominantly polymorphonuclear spinal fluid but coupled with this finding are the profound allergic reactions of the nervous system

I am of the opinion that the spinal fluid cytology may aid in differentiating meningeal reactions Thus, any reaction that is predominantly lymphonytic would connote an extrathecal pathology such as exists in those diseases producing serous meningitis eg the lymphocytic phase of tuberculous meningi tis polio-encephalitis the lymphocytosus found in paracyphilitic diseases of the central nervous system and chorismening its. On the other hand, when there is a predominantly polymorphonuclear cell increase in the spinal fluid. I believe it is evidence that some foreign substance either chemical bacterial viral or serous has gained direct entrance into the spinal

During the period of general wrum sickness headache, nausen, vomiting, and neuralgia frequently occur The findings of a moderate increase in lymphocytes and increased fluid pressure in the rerebrosman fluid during the early stage of serum sickness indicate that a definite neurologic disorder be responsible for the bendache nausea and vomit

Corroboration of the conc pt that extrathecally injected scrum will if it affects the meninges result in a lymphocytic response is found in the first reported case of optic neuritis by Mason patient received 500 cc of anti-pneumococcal serum and eleven days later developed marked general urticaria temperature 104 F Scrum sick ness persisted for two weeks, and, three days later the patient became drown, and very dull the ophthalmoscopic findings the ccrebrospinal fluid showed increased pressure globulin was present and there were 150 lymphocytes per emm

The introduction of a foreign protein into the theea may produce a primary nonallergic effect and at times it may be so seriou as to cause death in a few hours from medullary and ecrebral edema But this primary reaction of the meninges must not be confused with allergic meningitis. The latter h a true hypersensitive reaction of the meninges which occurs only after a latent period following the primary sensitizing injection.

The cerebral syndromes may be characterized by choked disks, meningeal irritation the kernig festamons as aphasia, alexia, hemianopsia, and bemplezia. The spinal fluid pressure is much increased The cellular reaction is slight Associated paralysis of the cranial nerves or a bulbar syndrome with or without tetraplegia may occur. These avadromes are cen broneural

Among the other related neural and cerebral complications which have been described an various forms of peripheral neuritis optic neuritis retinal edema, and iritia

Ocular involvement in scrim sickness has apparently been the subject of few reports but they are extremely convincing and should awaken inter-

Other reports of recurrent paralysis of the larvax and auditory nerve involvement are of equal interest in showing that the cerebral form of allergy may or may not be combined with involvement of the emuial nerves

The physiologic pathology of the cerebrospinal allergic manifestations is the result of a combination of sparmodic vascular disturbances with consequent edema of the brain and permeural edema, causing pressure symptoms. This evanescent pathol ogy accounts for the generally good prognosis in all of the neurologic sequelac

If one bears in mind the many phases of these hypersonsitive reactions herein presented, it should aid in the diagnosis and differentiation of cerebrospinal reactions which may ensue following the use of such diverse substances as sulfonamides, penicillin streptomycin, hapamine virus vaccines food and other allergens.

I am sure that Dr. Clarke's paper will arouse a great interest in these neurologic phases of clinical medicine. I would emphasize his thesis that we as pediatricians, should become cognizant of the notential role that allergy plays in this neurologic symptomatology

EFFECT OF SALAD DRESSINGS ON VITAMIN C

Salads made with French dressing were found to retain more of the vitamin C of the greens than aimilar salads made with the same amount of plain vinepar (acetic acid) The explanation for this observa tion may he in the fact that vinegar apparently contains traces of metals which haston the oxidative destruction of vitamin C Seasonings in the French dressing however were thought to exert a protective action on the vitamin.

The losses in vitamin C became apparent after a

period of two hours during which the salads mixed with dressing were kept standing in enameled bowls at room temperature. Following good culinary prac tice which dictates that greens be served well chilled and mixed with the dressing just before eating therefore insures not only palatable salads but maximum retuntion of their vitamin content—Borden s Review of Autrition Research January 1948

DIAGNOSTIC EXPERIENCE WITH HEPATIC SPECIMENS OBTAINED BY NEEDLE PUNCTURE

SAMUEL SANES, M.D., WILLIAM H. C. CHAPPLE, M.D., VICTORIA A. ONORATO, A.B., and EILEEN MARCHANT, A B, Buffalo, New York

(From the Edward J Meyer Memorial Hospital and the University of Buffalo Medical School)

O OBTAIN hepatic specimens we use a Vim-L Silverman needle which consists of a needle and a bipronged obturator with a cutting edge The site of the insertion varies from case to case, and we try to restrict biopsy to cases with clinically enlarged livers In a case with an extremely large, firm liver the approach is subcostal to the right of the rectus muscle When the liver is not greatly enlarged, the approach is through a lower intercostal space in the anterior axillary line well below the upper border of the liver, as determined by percussion If a mass or nodule is detected in the liver, such lesion is entered directly Bleeding, clotting, and prothrombin times should be carried out routinely before biopsy

The skin at the selected site of insertion is infiltrated with 1 to 2 per cent procaine to and including the parietal peritoneum. The skin is incised with a scalpel, and the Silverman needle introduced with the obturator point held withdrawn to a level even with the needle point. When the respiratory mobile liver is entered, paradoxical movement of the head of the needle occurs obturator is then passed deeper into the liver after which the needle is pushed in further with the obturator held in place. The motion thus produced forces the prongs of the oburator together and upon complete withdrawal of the obturator, a specimen of liver measuring from 18-25 cm in length and about 015 cm in diameter is obtained (Fig. 1) After fixation of the specimen in 10 per cent formaldehyde, paraffin sections, stained in hematoxylin-eosin, are made No clinical information is given the pathologist before he completes his report

Material and Results

From September, 1946, to March, 1947, we attempted to obtain hepatic specimens by needle puncture 46 times, 44 times from living patients and twice from 2 postmortem patients Fortyfour hepatic specimens proved to be satisfactory for histologic study One specimen was too small for conclusive interpretation, a second specimen was composed only of fibrous tissue A positive pathologic diagnosis could be made in hepatic

specimens from 33 patients In 9 patients, an indefinite or negative report for primary or significant disease of the liver had to be given positive diagnoses included fatty changecirrhosis 6, portal-Laënnec cirrhosis 14, portal cirrhosis-tuberculosis 1, portal cirrhosis with pigment 1, metastatic carcinoma 3, leukemia with hemosiderosis 1, amyloidosis 2, heptocellular degeneration and necrosis 3, and obstructive naundice 2

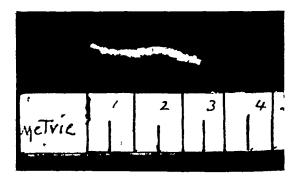

Fig Gross specimen obtained by needle puncture

Case Reports

Case 1 (Fatty change) -C F, a thirty-one-yearold man, had a history of heavy alcoholic ingestion for one year He was admitted to the hospital in acute intoxication Acne rosacea was present. The liver was palpable 3 fingers breadth below the costal Hepatic biopsy disclosed a fatty liver of moderate degree Laboratory work was as follows serum bilirubin 1 mg per 100 cc, prothrombin time was not increased, bromsulfalein test 26 per cent retention after one hour, hippuric acid 044 Gm, benzoic acid 03 Gm, cephalin flocculation test 1 plus, alkaline phosphatase 62 Bodansky umits, nonprotein nitrogen 36 mg, total protein 6 6 Gm, serum albumın 3 7 Gm, globulın 2 9 Gm

Case 2 (Fatty change-cirrhosis) —G B, a fifty-nineyear-old man, was admitted for acute alcoholism There was a history of emesis of dark material The skin and sclera showed icterus The liver was enlarged Hepatic biopsy showed fatty changes with portal cirrhosis Laboratory data recorded the folserum bilirubin 20 mg per 100 cc, prothrombin time with twenty-second control, sixteen seconds, bromsulfalem test 32 per cent retention in one hour, hippuric acid 0 67 Gm, benzoic acid 0 45 Gm, cephalin flocculation test 3 plus, formol gel

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo Section on Pathology and Chnical Pathology, May 8 1947

test 4 plus, alkaline phosphatase 102 Bodansky unita nonprotein nitrogen 24.3 mg. total protein 69 Gm. serum albumin 2 Gm, globulin 40 Gm

Case 3 (Latince's curhous)—J S a fifty three-year-old man with a history of alcoholism had anorexa, hematemesis, and ascites. Learnination revealed slight jaundice enlarged liver prominent abdominal venus ascites and spider anglomas Hepatic biopsy indicated Latince's cirrhous. A report of laboratory data was as follows serum bilirubin 41 to 05 mg per 100 cc. prothrombin time eighteen seconds, control fifteen seconds bronsulfale in test 165 per cent retention after one hour hippure acid 0 148 Gm benzote acid 0 10 Gm, cephalin flocculation test 2-4 plus formol gel test 1 plus alkaline phosphatase 77 Bodansky units nonprotein nitrogen 25 mg. total protein 5 5 Gm, globulin 2.7 Cm.

Cose 4 (Metastatic carcinoma)—J M. a seventy two-year-old woman was brought to the hospital for weakness. She did not cooperate during the examination. The skin and mucous membranes were pale and slightly ieteric. The liver was smooth, palpable 2 fingers breadth below the costal margin A mass felt in the left upper part of the abdomen was thought to be spicen. Peripheral lymph nodes were enlarged. Hemoglobin 45 per cent red blood cells 8 500 000 per cu, mm. white blood cells 20 700-40 450 per cu, mm. with 95 per cent neutrophils Hepatic biopsy indicated adenocarcinoma, apparently metastatic. The autopsy findings were primary carcinoma of stomach with metastases to liver, lung, pleura lymph nodes adrenal gland and bone (Fig. 2).

Fig 2 Metastatic adenocarcinoma (Case 4)

Case 5 (Leukemia-kemoniderosis) — J Q a sixty infine-year-old man had swelling of the abdomen There was a history of alcoholism. On examination the tyleen and liver were palpable. Ascites was present. The white blood cell count was \$2 000–100 480 ler cu mn with 08 per cent lymphocytes. Hopatic blopsy showed leukemic (chronic lymphatic) infiltration in periportal zones with marked hemosiderosis Laboratory work was reported as follows serum bilirubin 1 mg. prothrombin tume not increased hippure acid 0 11 Gm benzole acid 0 08 Gm ceptahin flocculation test 2 plus formol gel test 3 plus total protein 47 Gm

Case 6 (imyloudous) —J P a thirty three-year old man, had had chronic pulmonary tuberculosis since 1940. The liver and spiece were palpable. The urine was negative for albumin. Hepatic biopsy indicated diffuse amyloidosis. Laboratory work was as follows—serum bilirubin 0.3 mg. por 100 cc., prothrombin time nineteen seconds control seventeen seconds, bromsulfalein test no retention after one hour hippuric acid 0.2 Gm—benson acid 0.14 Gm—cophalin flocculation test 1 plus formed gel test 4 plus alkaline phosphatase 7.3 Bodansky units—nonprotein nitrogen 25 mg total protein 6.2 Gm—serum albumin 3 Gm. globu lin 3.2 Gm.

Case 7 (Hepatocellular degeneration)—P M a forty-soven-year-old man had jaundies for one month The liver was enlarged and tender At operation no extrahepatic obstruction was found. Surgical blopsy revealed marked hepatocellular degeneration. In hepatic biopsy obtained by needle puncture five weeks later only slight regressive changes of the type noted in the surgical specimen remained. Laboratory data recorded the following sorum bilimbin 33 2 23 8, 17 2, 11 4 6 1 mg., hippuric acid 0 34 Gm bic noice acid 0 2 Gm, cephalin foeculation test 0 formol gel test 1 plus alkaline phosphatase 6.5 Bodansky units nonprotein nitrogen 21 6 mg total protein 5-6 Gm albumin 37 Gm

Case 8 (Obstructive jaundice) -G B arixty yearold man, complained of saundice with chills and fever. He had suffered a similar attack one year Leukocytosis was present. The liver was nainable 2 fingers breadth below the costal margin Hepatic biopsy revealed obstructive jaundice, ascending cholangitis and pericholangitis early abseess. At operation the gallbladder and common bile duct contained numerous black calculous gran ules 2-3 mm in diameter. Other operative findings included cholcoystitis, cholangetis, and acute pancreatitis. Cholangiogram before discharge of pa tient revealed patency of the common bile duct. The report of the laboratory data was as follows scrum bilirubin 13.0 to 1 mg per 100 cc prothrom bin time twenty seconds control sixteen records cephalin flocculation test 1 plus formol gel test 1 alkaline phosphatase 66 Bodansky units nonprotein nitrogen 27 mg per 100 cc total protein 05 Gm serum albumin 3.8 Gm. globulin 2.7 Gm.

Case 9 (Negative report for primary kepatic discase) - E. H. a fifty-seven-year-old man complained of swelling of the abdomen, anorexia weight loss and abdominal pain. The liver was palpable 6 fingers breadth below costal margin. The spleen was questionably palpable. Recurring ascites was present The clinical impression was Laennees cirrhosis. Two hepatic biopsies, however, disclosed no curhosia. Lobular structure was preserved Congestion with regressive changes in central veins was noted. On the basis of the hepatic biopsies the chnician a attention was directed toward the possibility of metastatic carcinoma or Chiari s syndrome. Laboratory data indicated the following serum bilirubin 0.3 mg, per 100 ec. prothrombin time not increased, bromsulfalein test 23 per cent retention after one hour, hippuric acid 0.24 Gm, benzoic acid 0.095 Gm, cephalin flocculation test 4 plus, formol gel test 4 plus, alkaline phosphatase 5.6 Bodansky units, urea N 18 mg, total protein 5.7 Gm, serum albumin 3.1 Gm, globulin 2.6 Gm

Operative and Postmortem Correlation — Microscopic examination of hepatic tissue obtained at operation in 2 patients, and at autopsy in 4 patients, confirmed the diagnosis made from the hepatic specimen obtained by needle puncture Needle biopsies repeated in 3 patients duplicated the findings in the original specimens

Clinical Aid—In 33 patients with a positive pathologic report and in 7 patients with a negative report for primary or significant discase of the liver in the specimen obtained by needle puncture. the clinician felt that he had received diagnostic In 2 patients histologic study of the hepatic biopsy yielded an indefinite microscopic interpretation of no clinical aid The patients in whom hepatic specimens obtained by needle puncture furnished aid to the clinician fell into 8 groups on the basis of the presenting clinical problem patients with enlargement of the liver for which a cause had to be established, (2) patients in whom it was important to exclude primary or significant hepatic disease, (3) patients with jaundice the type of which was sought, (4) patients with Laënnec's cirrhosis in whom it was desired to confirm the clinical impression, (5) patients with Laënnec's curhosis in whom the coexistence of primary carcinoma of the liver had to be checked, (6) patients from whom a tissue diagnosis of the liver was desired before undertaking certain types of therapy, (7) patients in whom it was deemed valuable to follow the course of hepatic disease by tissue examination, (8) postmortem patients in whom complete autopsy to check clinical diagnosis could not be done

Hazards and Limitations —In our series of 44 living patients we encountered no really serious

complication from needle puncture patient, however, at laparotomy subsequent to hepatic biopsy, a moderate subphrenic hemorrhage was found, a drop in the red blood count had appeared after the needle puncture patient where the hepatic biopsy showed purulent cholangitis and abscess, the question of infection of the peritoneal cavity was raised, at subsequent operation, no untoward effect was noted, the site of needle puncture could not be seen sides the risks of hemorrhage and infection, other possible hazards of needle puncture (not encountered by us) consist of perforation of the intestine or gallbladder, and injury to the kidney, adrenal gland, or pancreas Restricting needle puncture to patients with enlarged livers and with normal bleeding, clotting, and prothrombin times ought to keep the various hazards at a minimum

In our series the size of the hepatic specimen obtained by needle puncture was inadequate for conclusive microscopic interpretation on pne It must be remembered that any occasion pathologic interpretation is limited by the small size of even the largest specimen Furthermore, the findings in the needle biopsy may not necessarrly represent those in other parts of the liver The effects of crushing in specimens, although bothersome to a degree in our series, were not substantial or frequent enough to offer regular difficulty to the pathologist in his examination The hepatocellular picture in certain needle biopsies, immediately fixed, differs, apparently on the basis of glycogen content of cells, from that in routine postmortem sections We feel, on speculative grounds rather than from actual experience in our series, that constant success should not be expected from the needle biopsy in distinguishing extrahepatic obstructive jaundice from intrahepatic jaundice

INSANITY RATE HIGHER IN WAR YEARS

The US Census Bureau reported that there was an increase in insanity among Americans during the war years, 1940 through 1945, especially among men in the military age bracket. The question was posed whether the "psychologic hazards of military life" drove more men insane or whether the intensive psychiatric scrutiny given men in this age group detected more cases of insanity. The increase in insanity among women paralleled that of men, but it was less in the 20 through 34 age group

The report covered the rise in the rate of first admissions of psychotic persons and it ignored hos-

pital admissions of psychoneurotics and marginal disorders such as alcoholism, mental deficiency, or drug addiction. The estimated number of first admissions to hospitals for permanent care of all patients with psychosis increased from 71.7 in each nundred thousand of population in 1940 to 86.8 in 1945, an increase of about 21 per cent. The number of men admitted to hospitals as psychotics was 78.8 per hundred thousand in 1940 as against 96.4 in 1945.

Admissions more than doubled among men aged 20 to 24, rose 78 per cent among those aged 25 to 29 and rose 36 per cent among those aged 30 to 34

CARCINOMA OF THE OVARY ARISING IN AN ENDOMETRIAL CYST

LEO D Moss, M.D, and A L RUNALS, M.D, FACS, Olean, New York

(From the St. Francis Hospital)

In gynecologic pathology there has hardly ever been a more controversial subject than the condition best known as 'endometriosis' Voluminous literature on this subject has appeared since the first report by Russell in 1899. In fact a whole monograph dealing with endometrous lass recently been published.

Endometrious presents two interesting fea tures first, the variety of clinical manifestations due to the wide distribution of the lesions second the problem of its pathogenesis. In regard to the latter a number of theories have been advanced, most prominent among which are the origin of endometrious from coelomic epithelium and Sampson's theory of "spill-over" of endometrial tirsue through the tubes into the abdominal cavity

Recently, we had an opportunity to observe the following unusual case of an ovarian endometrial cyst, showing areas of carcinomatous transformation

Case Report

The patient was a forty five-year-old woman who consulted one of us (A. L. R.) because of fullness in the abdomen and attacks of nausea during the preceding two months. The patient also stated that she had not menstrusted during that period to that time she had had a normal menstrual history of a twenty-eight-day type. She was married and had borne 3 children all of whom were alive and well. There was no history of abortion miscarriage or serious illness including operation She appeared to be well-nourished and in good health. However there was a mass extending from the pelvis up to the level of the umbilious, located somewhat to the right side oval-shaped not particularly tender fairly movable, and quite firm Vaginal examination revealed old lacerations of the cervix and on bimanual palpation the mass could again be felt to arise from the polvic cavity Both lower extremities showed marked varicosities. The urine and blood count analyses were essentially normal. The Wasser mann test was negative. The provisional diagnosis was pelvic tumor either ovarian cyst or uterine fibrold

A laparotomy was performed on November 7 1945 Through a lower midline meision the abdomen was explored. The uterus could not be seen at first, because it was conecaled by a huge right ovarian mass, adhering to it in various areas. The mass was also adherent to other structures of the cul-do-sac, including the rectum for a distance of 7 to 8 cm. In some places the mass was adherent to portions of the transverse colon and small intestine. The left ovary was enlarged and cystic. It too was adherent to the utrus to the left lateral abdominal wall, and to the broad ligament

The right ovarian mass was freed but it ruptured as it was about to be excised allowing thick chocolate-colored fluid to escape into the abdominal cavity. The resection of the mass was nevertheless completed. Its adhesions to the rectum were very dense and it was necessary to 'denude the rectum for a considerable distance in order to free them. The left adness and the supracervical portion of the uterus were removed together. Following the operation the patient made an uneventful recovery and was discharged after three weeks.

The uterus and adneta were received for examina tion The uterus measuring 8 by 6 by 5 cm., had been amputated across the lower portion of the cervical canal. The endometrial cavity measured 6 cm. in length and in its fundal portion there was a pea-aised mucosal polyp The myometrium contained a grayish white nodule which measured 1 cm. in diameter The left tube measured 5 cm. in length 1ts fimbriated end was patent. The left ovary measured 0 cm. in the longest diameter and contained 3 cysts 2 of which were filled with clear straw-colored fluid, while the third one presented some reddish brown viscid fluid.

The right overy was transformed into a large eystic mass which measured 16 cm in the longest diameter When it was received in the laboratory it was partly opened and collapsed. The external surface of the cystic mass presented many fibrous adhesions. The cyst wall varying in thickness was quite thin in many areas, while in others it measured up to 1 cm. in thickness. The cyst contained much thick, chocolate-colored fluid. The inner lining of the cyst was gray in some places, and a dark brown, chocolate-like color in others. In a few scattered areas the inside of the cyst presented yellowish-pink to yellowish-gray friable papillary excrescences which did not exceed 3 cm. in width and 1 cm. in height Detached pieces of apparently identical tissue were found floating in the chocolate-colored fluid filling the cyst The right tube measured 7 cm. in length. Its fimbriated end was patent.

Microscopic examination of the uterus indicated that the endometrium was in proliferative phase. In some areas the glands some of which were dilated, seemed to be more concentrated in number and dipped into the myometrium. The nucesal polyp contained endometrial glands such as seen in the proliferative phase and here too some glands were dilated. The nodule in the myometrium was found

Presented at the 141st Annual Meeting of the Meetlers Sociaty of New York State, Buffalo Section on Pathology and Clindes! Pathology May 7 1917 Since this article was submitted for publication another the pathology of the Present States in an endometrial

care of eardioms of the overy arising in an endometrial crat of cardinoms of the overy arising in an endometrial crat has been reported by Dr. Emil howsk in the Jeursal of the Meunt 5 and Herpital 14:529 (1947)

Fig. 5 Area of infiltrating squamous cell carcinoma

The study of this problem, both from the clinical and diagnostic point of view, gained fresh impetus through the extensive investigations of J A Sampson 5-9 His theory, now well known and rather widely accepted, maintained that during menstruation viable fragments of endometrial tissue as well as tubal mucosa may be "spilled over" by retrograde motion into the peritoneal cavity Here, these fragments may become implanted on the ovary, which is next to the fimbriated ends of the tubes and therefore most frequently involved, and on other structures of the peritoneal cavity Once such endometrial fragments have successfully engrafted themselves on other organs, they may become transformed into cysts, whose lining epithelium in response to hormonal stimulation may participate in the hemorrhages associated with the menstrual cycle Spontaneous perforation of such cysts could occur at an early or late date and give rise to the formation of secondary endometrial cysts in the same The occurrence of adhesions is or other organs another complication of spontaneous perforation of endometrial cysts

The presence of decidual reaction in some endometrial cysts was cited by Sampson as another proof for his theory. However, decidual reaction outside of the pelvic organs has been

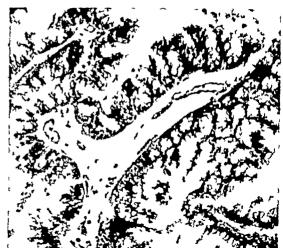

Fig. 6 Area of mucous cell carcinoma

observed without endometriosis during pregnancy. The recent report of ectopic decidua in the subserosa of the appendix vermiformis by Sanes and Liber would not support Sampson's conclusions ¹⁰. In regard to adenomyosis of the uterus itself, Sampson suggested two possibilities, namely, invasion of the endometrial cavity and extension from perimetrial implants ⁵. He also

Fig 7 Adeno-acanthoma

expressed the belief that, occasionally, the implan tation of normal endometrial tasue in the ovary may lead to the development of ovarian carcinomas In his numerous papers, Sampson presented a great number of case reports to support his theory, thus contributing materially to the clinical knowledge of this subject. Indeed, such rare lesions as endometrial implants in laparotomy scars, following operations in which the uterine cavity has been opened, are now well known, there seems to be no question that in these cases, at least, transplantation of endometrial tissue led to endometricsis

The opinions expressed by Sampson in his were not uncontested Robert Meyer came out very strongly in favor of the peritoneal epithelium being capable of giving rise to endometrum-like structures and stated in addition, that inflammation was probably an important factor in the development of endometnoss.11 Furthermore, he pointed out, as Lauche, Pick and others had done earlier the close rela tionship between the peritoneal epithelium and Muellerian duct structures Indeed, in the classic Manual of Human Embryology, by Keibel Everything and Mall, we find the statement that is later developed within the genital fold has a common origin from the coelomic epithelium," and a recent textbook of embryology states Muellerian ducts seem to arise independ

ently by a process of infolding and then closing off of a groove in the coelomic mesothelium paral

lel to the mesonephric duct. 12 13

Tobler described the occurrence of endometrium-like proliferations on the sigmoid colon.14 He, too, accepted the peritoneum as the source of these proliferations. Emil Novak, in a detailed analysis of this problem, discussed first the embryologic angle pointing out that the genital tract and germinative epithelium are derivatives of the coclomic epithelium and as such are actu ally only a modified perstoneum.15 Under hormonal influence this altered coelomic epithehum, which retains a remarkable sensitivity to ovarian hormone, develops in different directions, such as the glandular patterns of the fundus and the cervical canal, and the squamous cell lining of the cervix. In the further course of his discussion Novak emphasized the fact that the direc tion of the movements of the cilia in the tubes as well as the direction of the tubal peristals is pointed toward the uterus He also felt that the lumen of the isthmic portion of the tube is too narrow for the passage of endometrial material, and lastly, he was not convinced of the viability of the cast-off menatrual epithelium a point which he used to question the validity of Jacobson s experiments using normal endometrium for transplantation 14

About the same time, Halban presented still another theory, expressing the view that desquamating fragments of uterine mucosa may enter lymph vessels and subsequently reach ovaries, peritoneum, abdominal wall, and even the inguinal region 17 This theory however, did not find many supportors, and today, it may be con sidered entirely abandoned

Aschoff strongly endorsed the coelomic theory and suggested that all endometrics be referred to as "blastomatoid or blastomatous formations of the cloacal portion of the coclomic epithelium ' which may arise either in the course of early developmental anomalies, under endocrine ovar ian influence, or, finally as secondary results of inflammatory processes 18 Recently wald concluded, too, that the coelomic walls should be considered capable of giving rise to new endometrial formations. 19 29 He believes that both epithelial and connective tissue elements of the coelomic wall can participate in this creation of endometrial tissue and explains the occur rence of endometriesis in the uterine wall, not connected with the endometrial cavity and even in uterine extremities on this basis.

We believe that the findings in our case tend to support the coelomic theory of endometrious By far, the greatest portion of the right ovarian cyst presented characteristic features of a socalled endometrial cyst. Carcinomatous trans formation of such cysts has previously been postulated, and, recently, a case was described by McCullough, Froats, and Falk. 11 In addition, Kuzma reported two cases of ovarian adenoacanthoma associated with endometricus of the overy and suggested the possible transformation

of the latter into carcinoma. 22

In our case the predominant appearance of the malignant portions was adenocarcinomatous. such as is found in fundus carcinomas of the uterus In addition, there were also squamous cell and mucous cell carcinoma elements, thus repeating the potentialities of the entire Muel lerian duot Surely, the presence of these three cellular elements points rather toward origin in the germinal epithelial calls lining the ovarian surface than toward origin in the fully differentiated uterms endometrial cells. It is a well known fact that surface epithelium of the overy may dip into the parenchyma, thereby producing tubular and gland-like structures surface epithelium itself is flat or low cuboldal, its deeper invaginated portions display a tendency toward columnar cell formation, frequently associated with a condensation and special arrangement of the underlying stroma, lending an appearance very similar to that of endometrium We are inclined to believe that this is the mech anism for the development of most 'endometrial'

In our case the endometrial cyst developed further to the ultimate extreme, namely, carcinoma, embodying several cellular elements which the multipotential coelomic epithelium is capable of producing We also suspect that the presence of endometriosis in the wall of the right tube, and, in addition, the presence of adenomyoma in the myometrium, are perhaps the expressions of an increased endocrine stimulation. responsible for the initiation and further development of all the changes described in our case

Summary

- A case of endometrial cyst with areas of carcinomatous transformation is presented
- Representative portions of the literature were discussed in regard to the different views on the subject of endometriosis
- The case presented in this paper appears to support the coelomic theory of endometriosis

ESTROGEN AND UTERINE CANCER

To the Editor —There is admittedly difference of opinion and conflicting clinical and experimental evidence as to the possible role of estrogenic hormones in the production of uterine cancer can be no difference of opinion, however, as to the harmful effects of estrogens when their ill-advised use delays the diagnosis of uterine cancer and permits an early curable lesion to advance to a stage at which cure is no longer possible

Bleeding is usually the first sign of uterine cancer, and it is perhaps not surprising that the patient, particularly at the time of her menopause, often confuses pathologic bleeding with functional disturbances of menstruation It is indeed a tragedy when her physician also confuses bleeding with abnormal menstruation and embarks on a program of estrogen therapy without first making certain that he is not

dealing with uterine cancer To realize that such a diagnostic error is by no means a rarity, one has only to review the histories of even a moderate number of patients suffering from an advanced stage of uterine

A constant stream of colorful pamphlets advertising estrogens pours from the mail onto the desk of every physician How seldom they contain a word of caution that the patient's symptoms may be due to cancer

One might wish that on every ampule and on every package of tablets containing estrogens there

could be printed in red letters
"DOCTOR, ARE YOU SURE YOUR PATIENT
DOES NOT HAVE CANCER?"

DIFFERENTIAL DIAGNOSIS OF CONGENITAL HEART DISEASE

MARTIN M MALINER, M D, Brooklyn, New York

(From the Pediatric Cardiac Department of the Post-Graduate Hospital and Medical School, New York City)

'ONGENITAL heart disease can be cured by With this announcement various lay newspapers and magazines mothers with children, diagnosed as congenital cardiacs are rushing to physicians for the cure many years the child born with a defective heart was considered a medical curiosity and rarely was a differential diagnosis attempted recent advances in surgery of the chest and following the pioneer work by Gross and Blalock on congenital defects of the circulators system at has not only become important, but even imperative for the chnician and especially the pediatrician to make a definite diagnosis of the underlying car disc defect 12 Unfortunately of the ninety-odd types of concenital heart defects only three or four are amenable to surgery at present.

However of these many varieties 85 per cent can be divided for the purpose of simplification into 8 important entities. Eliminating the rare and complicated conditions and concentrating upon the more common 8 syndromes, makes it possible for the clinician to venture a correct opinion. It is interesting to note that approximately 15 per cent of children ill with heart disease, suffer from a congenital heart defect.

The purpose of this paper is to present a simplified plan for diagnosing the more common types of congenital cardiac defects. During the period of early infancy, the various congenital lessons have indefinite manifestations and very often present no gigns at all This makes a diagnosis at this age period not only uncertain but often impossible Frequently in early infancy cyanosis may be delayed for some months and even years in the presence of quite a high degree of raised oxygen unsaturation produced by direct admixture of venous blood with the arterial stream so that its absence in infants with physical signs indicating the presence of a defect, does not necessarily exclude a lesion of the cyanotic group This means that all blue babies need not be blue at birth or during the early months of

Cyanosis in congenital cardina defects is due to two factors (1) The admixture of venous blood in the arterial blood stream, and (2) deficient circulation in the pulmonary system Figure 1 presents a logical explanation for the delayed cyanosis in those infants who actually belong to the cyanotic group Striped portions

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo Section on Pediatrica May 9 1947 signify venous blood white portions (in this case only the umbilical veins) represent fully oxygen ated blood and the dotted portions, the admixture of venous and arterial blood. One can readily see that except for the head no oxygen reaches the infant, and so it is quite likely the fetus, which has adjusted itself to exist with very little oxygen during the nine months of prenatal life, may continue to do so during the neonatal period.

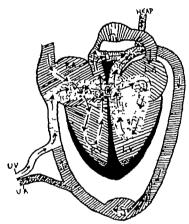

Fig. 1 Fetal circulation.

For the differential diagnosis of congenital heart lesions it is of first importance to place the case into one of two categories those without cyanosis (acyanotic), and those with cyanosis (cyanotic) Having properly grouped the patient, the next important consideration is the heart murnur with its point of maximum intensity time of cardiac cycle area of transmission, and quality

The most frequent defects, causing heart mur murs in the acymnotic group, are as follows

- a Patent interventricular septum (small)
- b Patent ductus arteriosus
- c. Aortic coarctation

d. Subaortic stenosis

Patent foramen ovale should be included in this group but because it rurely, if ever presents any signs or symptoms it may be ignored.

The most common defects, causing heart murmurs in the evanotic group, are as follows

- a Pulmonary stenosis (usually tetralogy of Fallot)
- b Large septal lesion (ventricular or auricular)
- c Eisenmenger complex
- d Transposition of the great vessels

In order to identify properly the members of these two groups, a résumé of the important characteristics of each will be presented, beginning with the acyanotic types

Acyanotic Types of Defects

Patent Interventricular Septum —This defect is the most common congenital lesion to be recognized clinically. It consists of an opening in the septum just below the aortic valve. Because of a normally stronger left ventricle during systole, some of the oxygenated arterial blood in the left chamber is shunted through the opening to the right ventricle, this blood becoming reoxygenated in the pulmonary circuit. Because there is no venous blood in the systemic circulation, there is no cyanosis

The characteristic clinical signs of this lesion are a loud rough systolic murmur with maximum intensity at the third or fourth interspaces to the left of the sternum (Fig 2), transmitted all over the precordium and heard even in the back between the scapulae A thrill frequently accom-

Fig 2

pames the murmur The intensity of the murmur is in inverse proportion to the size of the septal opening, the larger the defect, the softer the murmur The pulmonic second sound, P2, is accentuated

X-ray examination reveals nothing pathognomonic Usually, the heart is normal in size and shape, although occasionally it appears slightly enlarged The electrocardiogram and blood picture are normal

This condition cannot be corrected by surgery The general prognosis, however, is good

Patent Ductus Arteriosus (Fig 3) —This defect is due to the failure of closure of the fetal vessel connecting the pulmonary artery and the aorta Here again because of the stronger left ventricle, blood is shunted across from the aorta to the pulmonary circulation, and, thus, no cyanosis is present

The most characteristic diagnostic sign is the murmur, which is so typical of this condition that, once heard, it is never forgotten. It consists of a loud, continuous systolic murmur, crescendo and decrescendo in type with its peak at the second heart sound. The point of maximum intensity is at the second left interspace (Fig. 2) and is transmitted to the neck and back. It is described frequently as being machinery, humming top, or whirlpool sounding in character and is often, but not always, associated with a thrill

The x-ray is usually characteristic in that the heart is either normal in size or slightly enlarged with a distinct prominence of the pulmonary aorta. This feature, however, is frequently absent.

Because of the increased amount of blood in the pulmonary arteries, the fluoroscope may show a so-called hilar dance, due to pulsating vessels in the hilus of the lung

The electrocardiogram and blood picture are normal The prognosis is good. This is one type of defect which is amenable to surgery

Aortic Coarctation (Fig 4)—An abrupt narrowing of the aorta usually just distal to the insertion of the ligament of the ductus arteriosus comprises aortic coarctation. It is not rare but is infrequently diagnosed, because signs and symptoms do not, as a rule, appear until adolescent or adult life. These signs, in turn, are due to an extensive collateral circulation from the internal mammary and intercostal arteries to the lower extremities.

Diagnosis depends upon discovering the following characteristics

1 Hypertension occurring in children or young adults with decreased blood pressure in the lower extremities Normally, the pressure is much higher in the legs than in the arms

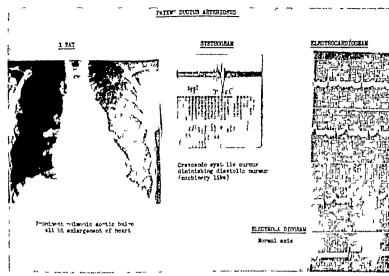

Fig 3

- 2 The iliac and femoral pulse are weak or absent.
- 3 Dilated and pulsating collateral vessels of the chest
- 4 A harsh systolic murmur at the base of the heart and over the back.
- 5 \ ray reveals a notching of the ribs with absence of the nortic knob. The former is pathognomen.

The general prognosis is good This condition can be corrected by surgery

Subscrite Stenors.—This is a very uncommon condition and is the result of a developmental anomaly which produces a narrowing of that part of the left ventricle situated immediately below the aortic cusps. The valves themselves are not involved and the stenosis does not as a rule, interfere with the normal egress of blood from the left ventricle. Therefore, except for the murmur none of the peripheral signs or symptoms of ac quired aortic stenosis are present. The systolic murmur is loud and rough, associated with a thrill, it is beat heard over the second right interspace (Fig. 1) and is transmitted to the neck.

The x ray and electrocardlograph are normal Prognosis is good This is not amenable to sur gery

Cyanotic Types of Defects

Pulmonary Stenosis (Fig 5) -This defect is

most often part of that well-defined entity known as the tetralogy of Fallot, which consists of four components stenosis to atresia of the pulmonary artery a patent interventricular soptum, dextroposition of the norta, and hypertrophy of the right ventricle. It is the most common combination of defects to be found in the so-called 'blue baby'

Fig 4 Aortic coarctation in a twolve-year-old boy Note notching of ribs on right side absent aortic knob and dilated internal carotid artery on left side.

PULLONARY STENOSIS (TETRALOGY OF FALLOT)

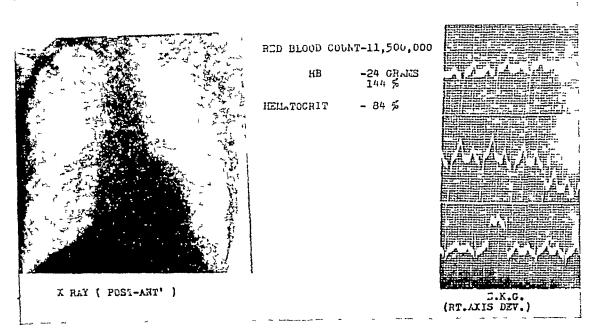

Fig. 5 Normal-sized heart with absent pulmonary bulge

In this syndrome both conditions whichmake for cyanosis are present. The stenosed pulmonary artery prevents the blood of the right ventricle from going to the lungs, and the large septal lesion permits a constant admixture of venous blood in the arterial chamber. During systole, because of the hypertrophied right ventricle and the aorta over-riding the right chamber, the venous blood is being directed into the arterial stream, the result being an early, and usually intense, cyanosis with clubbing of the fingers and toes.

The stenosis produces a loud systolic murmur over the second left interspace (Fig 2) and a softer, more blowing murmur along the border of the sternum because of the septal defect. The pulmonary second sound, P2, is diminished or absent

The electrocardiogram shows a marked right axis deviation. The x-ray reveals the coeur en sabot or boot-shaped heart due to the enlarged right heart, elevating the apex of the left ventricle producing a double apex. The heart itself is normal in size or only moderately enlarged with a characteristic absence of the pulmonary arch Because of the pulmonary stenosis, there is a deficient circulation in the lungs and, therefore, an unusual absence of pulsations in the hilar vessels. This is entirely different from the hilar dance of the patent ductus arteriosus. The blood picture

shows a marked increase in the number of red blood cells with a very high hemoglobin content

The general outlook is poor However, surgery increases the pulmonary circulation and produces a most miraculous relief to the patient

Large Patent Interventricular Septum —In this case signs and symptoms depend upon the size of the defect The larger the opening, the greater the tendency to admixture of venous blood in the left chamber with consequent increased cyanosis and clubbing The systolic murmur also varies The smaller the openwith the size of the lesion ing, the louder the murmur and vice versa the larger defects there is a soft systolic murmur along the sternum without a thrill being present The x-ray reveals a large bottle-shaped heart with no distinct pulmonary bulge The electrocardiograph shows a right axis deviation general prognosis is fair

In the patent interauricular septum defect, there is a flow of blood from the right auricle to the left auricle, producing cyanosis and clubbing Because of poor contractile power in the auricles, only a soft murmur, at best, may be heard at the base X-ray of the heart shows a large pulmonary artery, probably a larger pulmonary convexity than in any other of the congenital lesions, together with enlarged lung hilar shadows. The electrocardiograph shows a right axis deviation. This condition frequently is associated with a

Nother the patent interventricular nor the interauricular septal defects can be remedied by

Burger

The Eisenmenger Complex —This is somewhat amiliar to the tetralogy of Fallot except that there is no stenosis of the pulmonary arters. The large patent interventricular septum over riding aorta and hypertrophied right ventricle are sufficient cause for a delayed cyanosis and clubbing. There is a soft systolic murmur over the sternum with an accentuated pulmonic second sound. On the contract of the pulmonary area due to hypertrophy of the conus and dilatation of the pulmonary artery. The hilus shadows are in creased and show a hilar dance. Right axis deviation is present.

This condition is not common and the progno-

sis is fair Surgery is of no avail

Transpontion of the Great Vessels—This defect is probably the most frequent congenital cardiac condition causing death in early infancy. In this case the aorta arises from the right ventricle and the pulmonary artery from the left

When associated with other cardiac defects life

may be prolonged slightly. In the pure type of disorder no arterial blood reaches the systemic circulation, and the infant is intensely cyanotic from birth. Life is inevitably brief. A case of this type may be suspected when the infant is markedly cyanotic from birth and no murmurs are heard. Clubbing is usually absent. The x-ray reveals nothing unusual, and the electrocardiograph shows a right axis deviation. Surgery is of no value.

Summary

Realizing the necessity of a better recognition of congenital heart defects. I have presented a simplified plan for the differential diagnosis of the more common types of these defects. By dividing the conditions into two groups those without cyanosis and those with cyanosis, the various types of defects can be arranged systematically Under these general headings four lesions of the acyanotic and four of the cyanotic are discussed briefly with important points of differentiation presented. Those defects which may be relieved or corrected by surgery are stressed.

GLUTAMIC ACID

In several articles recently published in popular periodicals experimentation with glutamic acid has been strongly exploited emphasizing its effects in raising general intelligence levels in subnormal periodical. The general public is being well informed of advances in experimental medicine but some of the side effects concerning which the Journal of the American Medical Association has warned repeatedly are less desirable. Even vast amounts of glutamic acid will not enable morons to approach genius over night.

Pressure of 'patient opinion may force physicians to prescribe products still in an early experient of the prescribe products still in an early experient stage. In recent years latent kidney damage appeared from the use of sulfonamide compounds dermatitis and alloride reaction from antibiotics unfavorable reactions from racemic ampletamine sulfate ('bennedrine sulfate) prescribed too frequently or in excessive amounts and toxic reactions from the authorization drugs.

In human subjects the administration of dl-glutamic acid was tried in conjunction with other known anticonvulsant therapy with groups of patients having grand mal potit mal, and psychomotor discharge types of attacks. Psychomotor and petit mal attacks were definitely decreased in frequency and increased mental and physical alertness of patients was observed. Grand mal scinures were unaffected In all cases tolerance to di-glutamic acid hydrochloride was high. Gastrointestinal reaction was minimal and other untoward symptoms absent.

The results thus far reported with glutamic acid in the types of cases mentioned are considered excellent. However experiments are still under way

The truly infractious progress of medicine in recent years has stimulated a public at titude of expectancy that many medical problems now unsolved will soon be fathomed. Inevitably disappointment will rosult in several instances. Most advances result from progressive accretion of knowledge over a number of years. Occasionally what appears to be definite progress turns out to be merely insufficient and uncontrolled experimentation—J.A.M.A. December 27 1047

MICROBIOLOGIC ASPECTS OF SALMONELLOSIS IN CHILDREN

ERWIN NETER, MD, FAPHA, Buffalo, New York

(From the Children's Hospital and the Department of Bacteriology and Immunology, University of Buffalo)

In contrast to typhoid fever, which, as a result of progress made in modern sanitation and the availability of an effective immunizing agent, has become a relatively rare disease, only little has been accomplished in the control of salmonellosis. Renewed interest in the clinical aspects of paratyphoid infections has been stimulated by the investigations into the antigenic structure and ecology of Salmonella organisms 1-4. It is now generally agreed that salmonellosis occurs much more frequently both here and abroad than was suspected even a decade ago. This report deals with the microbiologic aspects of sporadic salmonellosis in children and is based on data obtained from 33 consecutive cases

Bacteriologic Diagnosis of Salmonellosis

Since the clinical syndromes encountered in Salmonella infections are not characteristic enough for diagnosis on clinical grounds only, it becomes imperative to establish the cause of the disease by means of microbiologic studies. The most reliable method available is the isolation and identification of Salmonella organisms from the patient. The recovery of paratyphoid bacilli from blood, pus, and urine does not present serious difficulty.

The isolation of Salmonellae from feces, however, is somewhat more complicated culties encountered in bacteriologic examination of fecal specimens have been largely overcome by the use of the rectal swab technic and the introduction of selective culture media, which suppress the growth of the saprophytic bacilli and support the growth of the pathogens nella-Shigella (SS) agar (Dico Laboratories), desovycholate-citrafe agar (Baltimore Biological Laboratories), Kauffmann's brilliant green agar, and, for certain strains at least, bismuth-sulfite agar yield a substantially higher percentage of positive isolations than the old-fashioned differential culture media, such as Endo agar tion, the fecal specimen should be placed in an enriching fluid It is essential that the specimen be seeded on the culture media immediately after it has been procured. Otherwise, it should be placed in a preserving fluid

In order to be able to furnish the clinician as soon as possible with a preliminary diagnosis, nonlactose-fermenting colonies may be seeded

Presented at the 141st Annual meeting of the Medical Society of the State of New York, Buffalo Section on Pediatrics May 9 1947

into triple sugar iron agar, Neter's 1 per cent lactose-5 per cent sucrose-1 per cent salicinphenol red broth, tryptophane, and urea media and used for serologic identification with a multivalent Salmonella serum Alternatively, the serologic identification may be accomplished on the following day by using the organisms grown on the triple sugar iron agar slant diagnostic Salmonella serum is being supplied by the Division of Laboratories and Research, New York State Department of Health experience, this serum causes rapid agglutination of the vast majority of Salmonella strains must be emphasized that for the final identification of any isolated strain, the cultural and biochemical characteristics must be established and a detailed antigenic analysis must be carried out Since the determination of the precise type of a strain requires the use of a number of typing sera and can be carried out only in specially equipped laboratories, all strains isolated in this laboratory are being forwarded to Dr Erich Seligmann, New York Salmonella Center, as well as to the Division of Laboratories and Research, New York State Department of Health

Incidence of Salmonella Types

Table 1 summarizes the data on the distribution of the various Salmonella types, encountered in 33 consecutive cases of salmonellosis in children between March, 1943, and March, 1947 For the sake of comparison, the respective figures compiled from Seligmann's series are included ²

It is worthy of note that in the present series not a single case of S paratyphi A infection was encountered S typhimurium was responsible for disease in more than half of all cases Group B, represented by 4 different types, accounted for approximately two thirds of all infections. It is also of interest to point out that members of group D were isolated less frequently than those of either groups C or E

Included in the series are 2 instances of salmonellosis due to rather unusual types, namely, a case of enterocolitis in a sixteen-day old infant, due to the London type, and a case of enterocolitis in a four-month old baby, caused by the St Paul type During April, 1947, S newington was isolated from a seven-day old infant suffering from colitis

In order to establish the incidence of the various Salmonella types presently encountered in

western New York, this study should be extended to ambulatory patients, food handlers, contacts of patients, and to healthy individuals and it should be supplemented by reports from other laboratores

Blood Cultures —Blood for cultural examina too was obtained from 12 patients —Six of these blood cultures were positive for Salmonella and 6 were sterile —Table 2 summarizes the pertinent findings in the 6 cases of Salmonella bacteremia

Mention may be made of the fact that in 2 of these cases the Salmonella infection occurred concurrently with, or as a sequela to, another malady namely meningoroccic meningitis and streptococcic sore throat. The relationship between simultaneously existing salmonellosis and other maladies has been discussed recently **

If the last with the diagnosts of acute the fifth to eight day of the malady salmonellosis. Antibodies usually do not appear before the fifth to eighth day of the malady hegative results may be obtained even in the presence of specific agglutinins, if suitable Salmonella suspensions are not employed.

In the present series Widal tests were carried out on serium specimens from 16 patients. Significant agglution titers were obtained in 7 instances. Indubitably, a higher percentage of positive results would have been obtained had serologic examinations been made repeatedly over a period of one to three weeks

In order to render the Widal test of greater value, diagnostic laboratories should have available, as antigens those types or representatives of groups of Salmonellae encountered in a particular area at a particular time. Obviously such antigens must be tested with respect to their agglu

tinability by sera of healthy individuals as well as of patients suffering from salmonellosis and other maladles Several such antigens have been prepared in this laboratory and are now included in the Widal test

Scasonal Distribution—The data on the sea sonal distribution of the present cases has been summarized in Table 3. It is evident that there is no seasonal peak during the summer months in fact, 16 cases were observed during the warmer season between May and September, while 17 cases were observed between October and April

TABLE 3 -- SEASONAL DISTRIBUTION OF \$3 SALMONELLOSIS

Number of Cases
8 1
3
8 0
2 2 2

Age Distribution —The age distribution of the patients is recorded in Table 4. It is worthy of note that of the 33 cases 23 or approximately 70 per cent, were one year old or less including 9 under the age of three months. The youngest patients were respectively, twelve and sixteen days of age at the time of the onset of the illness. During April, 1947, salmonellosis in a seven-day old infant was encountered

The fact that Salmonella infection was seen predominantly in infants need not necessarily be

NEUROLOGIC PROCEDURES IN PEDIATRIC PRACTICE

Bronson Crothers, MD, Boston, Massachusetts

(From the Children's Hospital, Boston, Massachusetts)

THE pediatrician is committed to an ambitious program which cannot easily be realized effect, he claims that he is a general practitioner for an age group He can readily subtract a few of the responsibilities of the practitioner among No one expects him to conduct obstetric procedures or to supervise the degenerative diseases of elderly people On the whole he does not need to concern himself with the hazards involved in industrial occupations To compensate for these considerable concessions he needs to acquire special skills in regard to the problems Through necessity he must adapt the technics of numerous specialists to his special In this discussion I wish to suggest methods by which he can select neurologic skills for his purposes

Everyone is vaguely aware of the fact that traditional medical nomenclature is based on The two special groups which Greek and Latin have retained traditional language are the dermatologists and the neurologists, and it is easy to see why they find this convenient On the whole, both specialties developed in a time when syndromes were reliable, because treatment or modification was difficult It is, of course, true that continuous progress is being made, but the description and identification of reliable syndromes is still an interesting, useful, and highly sophisticated occupation

In pediatric practice degenerative disease is of negligible importance, and one of the least valuable assets to a pediatrician is an ability to identify Charcot-Marie-Tooth progressive muscular atrophy of adolescence or Tay-Sachs' amaurotic family idiocy. The problems of children, particularly those of young children, are largely due to processes which threaten orderly growth rather than to those which are accompanied by degenerative changes.

It is possible, I believe, to meet most of the neurologic, and perhaps most of the psychiatric, problems of children if we start with the pediatrician's chief assets, a competent interest in normal growth and development and concern about deviations from expected progress

A few generalities and definitions may make later discussion less confusing First, the child in our culture is a dependent individual. The activities and the attitudes of the people who,

Presented by invitation at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Pediatrics May 8 1947 rightfully or by usurpation, control or try to control him are factors in establishing his physiologic and psychologic structure

Second, development begins at conception and not at birth

Third, the effect of any lesion which causes distortion of orderly development will be more devastating in proportion as the child is less mature

Fourth, recovery and convalescence are very different in adults and in children. In adults recovery means restitution to an established status, whereas in children it implies unimpaired capacity for development.

The causes of neurologic disease in children are, of course, varied, but they are certainly very different from those in adults. The adult clinics are largely resorted to by patients who have been battered by life's experiences or who are old or are the victims of syphilis. Degenerative disease is rare in children and syphilis of the nervous system, although constantly searched for, is an almost negligible condition in my experience. The major problems are due to a vast variety of infections and to trauma, with a scattering of tumors and a baffling collection of convulsive states and deviations from developmental effectiveness which we cannot yet understand

The way to approach neurologic appraisal is to think in physiologic terms—If anterior horn cells are damaged, abolition of function occurs—If sensory impulses are cut off, the results can be anything from anesthesia to blindness or ataxia to lack of recognition of form

If the cord is transected, the result is isolation of the part of the nervous system below the lesion. If the lesion involves much of the cerebral hemispheres, the result is what amounts to physiologic decerebration with the primitive patterns of behavior which are seen in artificially decerebrate animals.

Cerebellar disorder leads to a series of phenomena, dominated by uncertainty of control, ataxia, dysmetria

Lesions of the basal gangha upset associated movement and produce tremors and athetosis

Finally, cortical lesions produce difficulty in controlling voluntary motion

With the physiologic picture in mind we go on to psychologic appraisal Fortunately, this part of the problem is not confused by evotic vocabulary, and pediatricians, if they are wise, will try to keep up with the parent teacher groups who are supervising patients no longer under medical care.

Finally, the last element is the appraisal of the adults who make such admirable and probably ineffective efforts to control the development of the children for whom they are responsible. The advantage of such a procedure is that it allows the pediatrician to state his idea of deficits and also points out the remaining assets. This certainly is worthwhile, since dectors are dependent on deficits for classification of disease, whereas parents are chiefly interested in assets.

With the physiologic picture in mind, with the psychologic material also defined, and with the adult environment under control, all the pediatrician must do is to plot his prognosis on an ascending scale of development and arrange the necessary modifications of education. In other words, he deals with neurology as part of pediatrics

Recent advances in pediatrics have led to increasing awareness of prenatal development From the neurologic point of view the recognition of German measles in the early weeks of pregnancy, of toxoplasmosis etc., is important. The saving of very young premature bables will prob-

ably result in a new group of blind babies with retrolental fibroplasia and mental defect. Again, the rescue of babies with crythroblastosis will always be perilous. The process of labor will always be perilous.

More and more the specific neurologic problems of children will, I believe, vary from those of adults, and the pediatrician will always have to meet injury and infection and anoxia in the ner

vous system, as well as elsewhere.

The specific tools are familiar to most of us. The ophthalmoscope is within our means, both financially and intellectually. There is no podiatrician who shrinks from lumbar puncture, and from there it is an easy step to the pneumoencephalogram. The electro-encephalogram is, for the moment, in the hands of experts, but only for the moment.

My plea is a simple one. If we recapture a physiologic approach, neurology need be no more forbidding than any other specialty of medicine I think the pediatricians' problems are so different from those seen by adult neurologists that the pediatricians must select rather than wait for a digest from the neurologists

ANNOUNCEMENT

1948 Medical Directory Deadline

All material for the 1948 Medical Directory of New York, New Jersey and Connecticut should be in the office of the Medical Society of the State of New York before April 15, 1948

No corrections or additions may be made after that date

ROUTINE EXAMINATION OF CEREBROSPINAL FLUID

Albert H Harris, M D, and Carl Lange, M D, Albany, New York (From the Division of Laboratories and Research, New York State Department of Health)

CEREBROSPINAL fluid contains the humoral and cellular material which the central nervous system releases into it. Samples of this fluid reveal distinguishable active processes in a variety of pathologic conditions, but they can do so only if optimal methods of examination and interpretation are employed.

Indications for the Examination of Cerebrospinal Fluid -- Manifestations of central nervous system involvement as, for example, in acute febrile meningitis, are usually so significant and often so alarming that the indications for obtaining cerebrospinal fluid are obvious In syphilis, however, the situation is altogether different, since the principal indications are not clinical ones the contrary, definite clinical evidence of neurosyphilis must be prevented, if possible, since symptoms and signs due to neurosyphilis often indicate irremedial damage. The responsibility of the general practitioner in this regard is considerable, for neurosyphilis is believed to begin, if at all, in the early stages of the disease, when the patient is most apt to be under his care active process in the central nervous system needs to be halted by adequate therapy during the asymptomatic stage, which usually lasts an appreciable time before clinical signs supervene

Fluid must be obtained for laboratory examination between six and twelve months after beginning therapy to determine evidence of central nervous system lues. Preferably, a specimen should be submitted both at the six- and the twelve-month stages. If evidence of neurosyphilis exists, a tap must be made at regular intervals as a control of treatment. Following conclusion of general antiluctic treatment, the final examination should be made, at the earliest, twelve to fifteen months after infection, when one may feel reasonably sure that if neurosyphilis is going to develop, indications will already have appeared

In summary, it can be said that compelling clinical signs and symptoms of central nervous system disorder furnish the indications in most diseases of the brain and spinal cord. However, in syphilis, fluid must be examined, not on the basis of clinical manifestations, but according to a time schedule

Method of Obtaining Cerebrospinal Fluid and Certain Precautions to Be Observed—Cerebro-

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo, Section on Pathology and Chuical Pathology, May 7 1947 spinal fluid, obtained by lumbar puncture, contains cells that have settled by gravity. Therefore, especially in syphilis, slight abnormalities are most readily demonstrated in fluid from the lumbar region.

Every effort should be made to avoid accidental contamination of the cerebrospinal fluid with blood during the puncture. The use of a sharp needle with the patient in a sitting position decreases the possibility of contamination. When such an accident occurs, however, the needle should be withdrawn and a different one inserted in a higher space. The practice of allowing fluid contaminated with blood to flow until visibly clear does not yield an optimal specimen. If, for any reason, a second puncture is impracticable, as clear a specimen as possible should be submitted.

Under no circumstances should the erythrocytes be removed from the fluid in such cases, since their presence, whether intact or hemolyzed, furnishes an indication of the amount of blood contamination. Whether or not useful information can be obtained from such specimens depends on the degree of contamination and the severity of the abnormal changes in the fluid, the less the contamination and the more marked the abnormality, the more apt such specimens are to be of some value.

Likewise, bacterial contamination must be avoided, if possible Spinal fluid pressure measurements are, as a rule, not indicated in syphilis, since they rarely provide information of value They increase the liability to contamination and, therefore, should be omitted

The amount of fluid required for routine examination is from 3 to 5 cc. It should be allowed to flow directly through the needle into a sterile tube. The stopper should be removed just long enough to catch the fluid and should then be replaced. No fluid should be removed with a pipet, especially after the specimen has stood awhile, since the distribution of cells will be uneven, and subsequent counts will be inaccurate. The dipping into the fluid with a cell-counting pipet, containing acetic acid, is a disastrous procedure.

Submission of Cerebrospinal Fluid Together with a Specimen of Blood—Cerebrospinal fluid obtained for bacteriologic examination is best examined in the nearest laboratory approved for bacteriologic procedures, because promptness in examination and reporting is essential in cases of

scute bacterial meningitis However, in the case of spinal fluids that require complicated and exacting technics, as is the case with most of the specimens that are clear and colorless, the specimen should be sent to a central laboratory or to a near-by local laboratory approved for undertaking complete cerebrospinal fluid examinations.*

Unfortunately, some changes can occur in transit Although the round cells are fairly reastant, polymorphonuclear leukocytes and red blood cells are easily lysed. This fact is significant when the fluid contains polymorphonuclear leukocytes in very low concentration, as in early tuberculous meningitis, since their detection is important to the diagnosing of syndrome. Any accidental contamination with bacteria is apt to render a mailed specimen unsatisfactory, since the time interval may encourage bacterial growth.

The submission of an accompanying specimen of blood is important, because, except in cases of acute bacterial meningitis, syphilis almost always enters into the differential diagnosis. While provided a satisfactory quantitative method is used, a specific reaction indicating lues is rarely found in the cerebrospinal fluid when no reaction occurs in the blood, the converse is frequently true, that is, in many syndromes in which the cerebrospinal fluid is abnormal yet fails to react in the quantitative complement fixation test for syphilis, the blood gives a positive reaction, thus indicating the luctic nature of the pathologic process in the central nervous system. Further more, when a diagnosis of neurosyphilis has been established, it is necessary to know the titers of reactions in the complement fixation test on both spinal fluid and blood as a guide to therapy

An outfit containing two tubes, one with a conical base for the cerebrospinal fluid and one of the usual type with needle for the blood specimen, is distributed for submission of specimens to the Division of Laboratories and Research (Fig. 1)

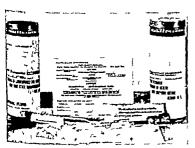

Fig 1 Cerebrospinal fluid and blood outfit.

Submission of History and Clinical Data.—Pertinent facts from the history and clinical data must accompany the specimen, this information is essential for an intelligent interpretation of the findings. In some pathologic conditions of the central norvous system, the laboratory findings add nothing to the understanding of the case. In others, the history and clinical data are not helpful. In the vast majority of cases however, the clinical and laboratory findings must be considered together for as comprehensive an understanding of the case as is possible.

Basic Cerebrospinal Fland Examinations —The types of examinations to be performed, when the specimens of cerebrospinal fluid and blood reach the laboratory, depend upon the history and childed data and on the appearance of the fluid. If the history indicates that the spinal fluid may contain pyogenic bacteria, or if the fluid is purilent, a cultural study is obviously indicated, for example, the presence of a cobweb clot requires

examination for tubercle baculli

Much more challenging to the diagnostic labora tory are spinal fluids that are normal in appear ance, that is clear and colorless. All such fluids require study by 5 basic examinations.

- (1) The appearance is noted as clear and colorless
- (2) A differential cell count is made with particular attention to mononuclear (round) cells, polymorphonuclear leukocytes and erythrocytes. The term mononuclear is used to include all cells other than granulocytes and erythrocytes
- The cells are stained with polychrome methylene blue and are counted in a Fuchs-Rosenthal counting chamber. With this large chamber 3 cu. mm of spinal fluid can be examined and the results can be expressed as the number of cells/3 However the routine report from this laboratory at the present time gives the number of cells per cu. mm. After the cells have been counted the fluid is centrifuged at high speed. The sodiment is then fixed on a glass slide and stained with methylene blue. An examination of this material serves as a check on the cell picture and may demonstrate bacteria that are present either as pathogens or as fortuitous contaminants.
- (3) The total protein concentration is determined by the sulfosslicylic acid method, in which a photoelectric colorimeter is employed
- (4) The colloidal gold test, valuable in differ entiating protein patterns, is performed. The citrate gold sol now employed is carefully stand ardised and checked for sensitivity and reproducibility by turbidimetry and by reactions with a test fluid. This sol has been found superior to the original formal gold sol and the various colloidal substitutes.

ROUTINE EXAMINATION OF CEREBROSPINAL FLUID

ALBERT H HARRIS, M D, and CARL LANGE, M D, Albany, New York (From the Division of Laboratories and Research, New York State Department of Health)

CEREBROSPINAL fluid contains the humoral and cellular material which the central nervous system releases into it. Samples of this fluid reveal distinguishable active processes in a variety of pathologic conditions, but they can do so only if optimal methods of examination and interpretation are employed.

Indications for the Examination of Cerebrospinal Fluid — Manifestations of central nervous system involvement as, for example, in acute febrile meningitis, are usually so significant and often so alarming that the indications for obtaining cerebrospinal fluid are obvious In syphilis, however, the situation is altogether different, since the principal indications are not clinical ones the contrary, definite clinical evidence of neurosyphilis must be prevented, if possible, since symptoms and signs due to neurosyphilis often indicate irremedial damage. The responsibility of the general practitioner in this regard is considerable, for neurosyphilis is believed to begin, if at all, in the early stages of the disease, when the patient is most apt to be under his care active process in the central nervous system needs to be halted by adequate therapy during the asymptomatic stage, which usually lasts an appreciable time before clinical signs supervene

Fluid must be obtained for laboratory examination between six and twelve months after beginning therapy to determine evidence of central nervous system lues. Preferably, a specimen should be submitted both at the six- and the twelve-month stages. If evidence of neurosyphilis exists, a tap must be made at regular intervals as a control of treatment. Following conclusion of general antiluetic treatment, the final examination should be made, at the earliest, twelve to fifteen months after infection, when one may feel reasonably sure that if neurosyphilis is going to develop, indications will already have appeared.

In summary, it can be said that compelling clinical signs and symptoms of central nervous system disorder furnish the indications in most diseases of the brain and spinal cord. However, in syphilis, fluid must be examined, not on the basis of clinical manifestations, but according to a time schedule

Method of Obtaining Cerebrospinal Fluid and Certain Precautions to Be Observed—Cerebro-

Presented at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo Section on Pathology and Chinical Pathology, May 7 1947 spinal fluid, obtained by lumbar puncture, contains cells that have settled by gravity. Therefore, especially in syphilis, slight abnormalities are most readily demonstrated in fluid from the lumbar region.

Every effort should be made to avoid accidental contamination of the cerebrospinal fluid with blood during the puncture. The use of a sharp needle with the patient in a sitting position decreases the possibility of contamination. When such an accident occurs, however, the needle should be withdrawn and a different one inserted in a higher space. The practice of allowing fluid contaminated with blood to flow until visibly clear does not yield an optimal specimen. If, for any reason, a second puncture is impracticable, as clear a specimen as possible should be submitted.

Under no circumstances should the erythrocytes be removed from the fluid in such cases, since their presence, whether intact or hemolyzed, furnishes an indication of the amount of blood contamination. Whether or not useful information can be obtained from such specimens depends on the degree of contamination and the severity of the abnormal changes in the fluid, the less the contamination and the more marked the abnormality, the more apt such specimens are to be of some value.

Likewise, bacterial contamination must be avoided, if possible. Spinal fluid pressure measurements are, as a rule, not indicated in syphilis, since they rarely provide information of value They increase the liability to contamination and, therefore, should be omitted

The amount of fluid required for routine examination is from 3 to 5 cc. It should be allowed to flow directly through the needle into a sterile tube. The stopper should be removed just long enough to catch the fluid and should then be replaced. No fluid should be removed with a pipet, especially after the specimen has stood awhile, since the distribution of cells will be uneven, and subsequent counts will be inaccurate. The dipping into the fluid with a cell-counting pipet, containing acetic acid, is a disastrous procedure.

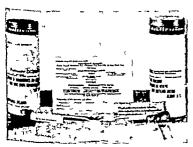

Submission of Cerebrospinal Fluid Together with a Specimen of Blood—Cerebrospinal fluid obtained for bacteriologic examination is best examined in the nearest laboratory approved for bacteriologic procedures, because promptness in examination and reporting is essential in cases of

acute bacterial meningitis. However, in the case of spinal fluids that require complicated and exacting technics, as is the case with most of the specimens that are clear and coloriess, the specimen should be sent to a central laboratory or to a near-by local laboratory approved for under taking complete cerebrospinal fluid examina tions *

Unfortunately, some changes can occur in transit. Although the round cells are fairly resistant, polymorphonuclear leukocytes and red blood cells are easily lysed This fact is signifi cant when the fluid contains polymorphonuclear leukocytes in very low concentration, as in early tuberculous meningitis, since their detection is important to the diagnosing of syndrome. Any accidental contamination with bacteria is apt to render a mailed specimen unsatisfactory, since the time interval may encourage bacterial growth

The submission of an accompanying specuren of blood is important, because, except in cases of acute bacterial meningitis, syphilis almost always enters into the differential diagnosis provided a satisfactory quantitative method is used a specific reaction indicating lues is rarely found in the cerebrospinal fluid when no reaction occurs in the blood, the converse is frequently true, that is, in many syndromes in which the cerebrospinal fluid is abnormal yet fails to react in the quantitative complement fixation test for syphilis, the blood gives a positive reaction, thus mdicating the luctic nature of the pathologic process in the central nervous system. Further more, when a diagnosis of neurosyphilis has been established, it is necessary to know the titers of reactions in the complement fixation test on both spinal fluid and blood as a guide to therapy

An outfit containing two tubes, one with a conical base for the cerebrospinal fluid and one of the usual type with needle for the blood specimen, is distributed for submission of specimens to the Division of Laboratories and Research (Fig 1)

Ccrebrospinal fluid and blood outfit.

Submission of History and Clinical Data .-Pertinent facts from the history and chincal data must accompany the specimen, this information is essential for an intelligent interpretation of the findings. In some pathologic conditions of the central nervous system, the laboratory findings add nothing to the understanding of the case In others, the history and clinical data are not In the vast majority of cases, however, the clinical and laboratory findings must be con sidered together for as comprehensive an under standing of the case as is possible

Basic Cerebrospinal Fluid Examinations -The types of examinations to be performed, when the specimens of cerebrospinal fluid and blood reach the laboratory depend upon the history and clinical data and on the appearance of the fluid If the history indicates that the spinal fluid may contain pyogenic bacteria, or if the fluid is puru lent, a cultural study is obviously indicated, for example, the presence of a cobweb clot requires examination for tubercle bacilli

Much more challenging to the diagnostic labora tory are spinal fluids that are normal in appear ance that is, clear and colorless. All such fluids require study by 5 basic examinations 1

- (1) The appearance is noted as clear and colorless.
- (2) A differential cell count is made with particular attention to mononuclear (round) cells, polymorphonuclear leukocytes and erythro-The term mononuclear is used to include all cells other than granulocytes and erythrocytes
- The cells are stained with polychrome methyl ene blue and are counted in a Fuchs-Rosenthal counting chamber With this large chamber 3 cu mm. of spinal fluid can be examined and the results can be expressed as the number of cells/3 However, the routine report from this laboratory at the present time gives the number of cells per After the cells have been counted the The sediment fluid is centrifuged at high speed is then fixed on a glass slide and stained with methylene blue. An examination of this material serves as a check on the cell picture and may demonstrate bacteria that are present either as nathogens or as fortuitous contaminants
- The total protein concentration is deter mined by the sulfosalies he acid method, in which a photoelectric colorimeter is employed
- (4) The colloidal gold test valuable in differ entiating protein patterns, is performed citrate gold sol now employed is carefully stand ardised and checked for sensitivity and reproducibility by turbidimetry and by reactions with n test fluid This sol has been found superior to the original formol gold sol and the various col lordal substitutes.

TABLE 1—Results of Cerebrospinal Fluid Examinations—Examples of Typical Findings
Turbid of Colored Spinal Fluids (Abnormal Appearance)

No	Clinical Data	Appearance	Cell Pi Mono- nuclears	cture* Poly- morpho- nuclears	Total protein (Mg/100 Cc)	Bacteriologic Examination	Interpretation from the Complete Syndrome
1	Acute febrile meningitis	Purulent, slightly yellow, coarse branching clot	87/3	3400/3	548	Culture hemolytic streptococci	Streptococcus meningitis
2	Vague signs of meningstus	Ground glass,' trace of yellow, cobweb-like clot	186/3	534/3	274	Ziehl-Neelsen stain of fibrin elot acid-fast bacilli seen	Chronic tuberculous meningitis
3	Fracture of vertebra with com- pression	"Froin's syndrome ic., xanthochromia complete coagulation	2/8	0/3	1450		Subarachnoid block

^{*} Fractions indicate the number of cells in the 3 cu mm. examined. In routine reports issued by the Division of Laboratories and Research cell counts are being expressed in the number per cu mm. to the nearest integer

The reaction of the gold sol with the serial dilutions of cerebrospinal fluid must be permitted to take place in a medium in which the pH and ion concentration have been carefully adjusted

(5) A quantitative complement fixation test for syphilis is essential, and, as has already been stated, it must be performed not only on the cerebrospinal fluid but also on an accompanying specimen of blood.² Unless the complement fixation test employed is quantitative, and unless it is high in sensitivity, specificity, and reproducibility, the results will be of inferior value

Typical Examinations and Findings

Specimens Exhibiting an Abnormal Appearance (Table 1)—The choice of examinations is determined by the appearance of the cerebrospinal fluid Fluids exhibiting an abnormal appearance are handled on an individual basis Determination of the cell picture and the total protein is routine, but other procedures, such as a microscopic examination of the sediment stained by Gram's method, culture in appropriate media, and animal inoculation, are performed as indicated by the particular specimen under examination

Specimen 1, a purulent spinal fluid from a case of acute febrile meningitis, required a bacteriologic examination, no bacteria were seen in the stained sediment, but hemolytic streptococci were isolated on culture

In specimen 2, the cobweb-like fibrin clot indicated an examination for tubercle bacilli, stained with Ziehl-Neelsen stain, acid-fast bacilli were found. When the history or appearance of the specimen suggests bacterial meningitis, appropriate bacteriologic examination generally furnishes a specific diagnosis. Under such circumstances, other types of examination are of relatively little significance in the interpretation of the complete laboratory findings.

Specimen 3 furnishes an example of From's syndrome complete coagulation and xantho-chromia When it is present, the appearance of

the fluid alone is pathognomonic of subarachnoid Contrary to the syndromes of specimens 1 and 2, From's syndrome does not provide a final diagnosis, since block is merely a complication due to compression or adhesions associated with a fundamental pathologic process From's syndrome is elicited by a pachymeningitis cervicalis syphilitica, for example, the luetic nature of the process cannot be determined by examination of the lumbar cerebrospinal fluid, since it is so heavily contaminated by infiltrating blood proteins that the basic picture is obscured The syphilitic cause of the meningitis can only be demonstrated by an examination of the cisternal fluid, which, in the absence of plasma proteins. will yield results in the five basic tests that are due only to the local process in the central nervous system

Specimens Exhibiting a Normal Appearance (Table 2)—Cerebrospinal fluids exhibiting a normal appearance fall into a different category. They form the major portion of the routine material in a laboratory performing complete examinations of spinal fluid. Contrary to abnormal appearing fluids, which are considered on an individual basis, all fluids that are clear and colorless are subjected to the five basic examinations.

Of these five, only the quantitative complement fixation test for syphilis can, by itself, yield information of etiologic value. However, even though a significant reaction in the complement fixation test for syphilis, performed on the spinal fluid, is indicative of syphilis, it does not prove local origin of the reagin. Information in this regard is furnished by the nonspecific colloidal gold reaction which demonstrates the presence or absence of plasma proteins in the spinal fluid, thereby establishing or excluding the possibility that some or all of the reagin is of hematogenous origin.

The nonspecific gold reaction also serves to differentiate the parenchymatous and nonparenchymatous forms of neurosyphilis. In the examination of spinal fluids from cases of multiple

Exciton indicate the number of sulls in the 3 cm mm, examined. In routine reports issued by the Dirivion of Laboratorics and Research, cell counts are being expressed in the

sclerosis, the only positive results are nonspecific ones

When the results of the five basic tests are integrated, however, and are viewed in the light of clinical data, a characteristic syndrome emerges. Thus, although specific and nonspecific tests provide entirely different types of information, in a majority of instances both are indispensable to the establishment of a complete syndrome

Specimen 4 yielded the syndrome of normality, characterized by normal values in each of the five basic examinations. Most important among the findings were the normal protein concentration and the normal colloidal gold curve type A. This particular syndrome was found in a case of paresis treated with penicillin. It demonstrates cure. So far, no relapse has been reported in cases in which the cerebrospinal fluid furnished values so completely normal.

Specimens 5 and 6 elicited the colloidal gold curve type B, formerly designated as the "syphilitic" curve. This curve reflects the type of protein pattern resulting from disintegration of numerous cells shed into the cerebrospinal fluid, occupying perivascular spaces during the active stage of diseases in which perivascular infiltration is a cardinal feature. The curve is encountered in neurosyphilis, multiple sclerosis, and in the stage of recovery from an acute virus infection.

In specimen 5 the history of syphilis, the abnormal cell count and increased total protein, and the gold curve type B, are indicative of nonparenchymatous neurosyphilis, the reaction in the complement fixation test of the blood, despite the absence of reaction in the cerebrospinal fluid, supports a diagnosis of neurosyphilis

In specimen 6 the abnormal cell count, increased total protein, and gold curve type B were not accompanied by any reaction in the complement fixation test for syphilis on either spinal fluid or blood. The history stated that the fluid had been obtained three weeks after the acute stage of mumps. In the absence of any evidence of significant parenchymatous involvement, one could anticipate that later examinations would reveal the syndrome of normality.

Specimens 7 and 8 elicited the colloidal gold curve type C, formerly designated as the "meningitic" or "hematogenous" curve This curve is found when there is abnormal communication between blood and cerebrospinal fluid, resulting in a seepage of blood proteins into the cerebrospinal fluid. In syphilis, blood reagin may thus filter into the spinal fluid, confusing the pathologic picture. The type C curve is found in evudative inflammation, in the acute initial stage of virus infection, in subarachnoid block, and in hemorrhage. It is not encountered in chronic

neurosyphilis, as long as the permeability remains

In specimen 7 the marked increases in mononuclear cells with occasional polymorphonuclear leukocytes and in the total protein concentration, together with a strong colloidal gold curve type C, are compatible with the physician's clinical diagnosis of encephalitis lethargica. Similar findings may occasionally be observed in tuberculous meningitis. However, no bacteriologic evidence of this latter disease was found in this particular fluid. As often happens in the acute phase of illnesses presenting similar pictures, the final diagnosis awaited a follow-up examination which is described under specimen 11

In specimen 8 an increase in mononuclear cells, the presence of polymorphonuclear leukocytes, and the colloidal gold curve type C are in marked contrast to the protein concentration, which is in the low normal range. In spite of the normal protein values, the cell picture and gold curve establish a syndrome of exudative inflammation, in this case indicating an aseptic meningitis of minimum degree, undoubtedly induced by the mastoiditis. Such findings are not prognostic Follow-up examinations may reveal decreasing inflammation or an overnight change in the picture to one of purulent bacterial meningitis.

Specimens 9, 10, and 11 elicited the colloidal gold curve type D, formerly designated as the "paretic" or "parenchymatous" curve This curve is associated with inflammatory processes similar to those that induce the type B curve, except that, in addition, there is more or less extensive parenchymatous degeneration, which may or may not be clinically apparent Because this type D curve is regularly found when late clinical signs point to degeneration of the parenchyma, from the practical standpoint of prognosis and therapy the curve is generally considered by syphilologists to indicate such degeneration before clinical evidence of it becomes manifest

Syndrome 9 is the so-called paretic formula, more properly a strong syndrome of parenchymatous neurosyphilis. The syndrome is characterized by a marked increase in round cells and in the total protein concentration, a strong colloidal gold curve type D, and high titers in the complement fixation test for syphilis with both spinal fluid and blood

In syndromes 10 and 11, the cell picture, the total protein concentration, and the protein pattern as reflected by the gold curve are all similar to those in syndrome 9. The histories are altogether different, however, and there is absence of complement fixation reaction in both cerebrospinal fluid and blood.

Syndrome 10 is typical of progressing multiple sclerosis—the active inflammation is indicated

by the abnormal cell and protein findings, the progressive parenchymatous degeneration is reflected in the gold curve type D These findings are sufficient to confirm the clinical diagno-

Syndrome 11 was encountered in cerebrospinal fluid from the same patient as specimen 7, three months later Cells and total protein had decreased considerably, while the gold reaction which was type C during the acute initial stage, was now type D indicating parenchymatous degeneration. The possibility of tuberculous meningitis, which previously entered into the differential diagnosis, was excluded by these latter findings They indicate that the chinical diagnosis of encephalitis lethargica was correct and that the disease had passed into the chronic phase

Conclusion

In conclusion, the following points are reemphasized Cerebrospinal fluid is precious and deserves examination by the best methods available. The significance of results varies in differ ent conditions In some cases, the laboratory examination furnishes the diagnosis in others, the clinical findings are sufficient. In most cases however, the diagnosis is made on the basis of the clinical and laboratory findings considered together as a complete syndrome

The results of laboratory examinations also serve as a guide in prognosis and therapy the least important is the fact that they may establish the normality of a specimen of cerebrospinal fluid which in treated neurosyphilis provides the demonstration of cure.

* SANITARY CODE Chapter II

Regulation 9 Physician to submit specimens for labora tory examination in cases or suspected cases of certain com municable diseases. A physician in attendance on a person affected with or suspected of being affected with any of the diseases mentioned in this regulation shall submit to an approved laboratory or to the laboratory of the state department of health for examination such specimens as may be designated by the state commissioner of health, together with data conserning the history and clinical manifestations per tinent to the examination ayphilis

Directions Governing Submission of Specimens

Syphilis

4 When central nervous system ayphills is suspected or before any syphilitic patient is discharged as arrested or cured 5 ml, of cerebrospinal fluid for the complement fixation (Wassermann) test and other tests for abnormalities. Send with each specimen of cerebrospinal fluid 10 ml. of the pa tient a blood taken at the time the specimen of cerebrospinal fluid was obtained for examination (outfit for blood and cerebrospinal fluid) (Effective December 17 1945)

SERIOUS DOG SHORTAGE IN MEDICAL RESEARCH

A critical nationwide shortage of laboratory animail, particularly dogs, for medical research has been highlighted by an announcement from the University of Denver that two scientists Drs. F D Amour and F R. Blood have developed technics for wide. wider use of rats in experiments and instruction

Since rats cannot replace dogs for many experi-ments, however there looms an increasingly urgent need for more experimental dogs in the great medi-cal centers of the country The shortage of dogs is attributed to several factors among them the fact that the dog population of the nation is not increasing and apparently is being materially reduced by the programs of the antivivisectionist cult. In one large city more than thirty thousand dogs are killed each year by antivivisectionist societies according to sta tistics released by them

The increasing cost of specially bred laboratory does is placing a strain on medical research budgets. It now is estimated that it costs at least \$25 to raise a dog from a pup to the point where he can perform his

valuable part in medical research

In expanding the role of the rat in teaching and research the Donver doctors have belped to relieve the principal research bottleneck but there are many types of experiments for which rats are basically un-suitable.—National Society of Medical Research January 16 1048

BACILLUS PROTEUS MENINGITIS

H LEPOW, MD, M FRIEDENTHAL, MD, and D JAFFE, BS, New York City

(From the Medical Service and the Laboratorics of the Lincoln Hospital)

BACILLUS proteus, formerly regarded as a harmless saprophyte, is now known to be pathogenic. It has been recognized as the causative agent in various infections. Pierson and Honke reported an incidence of 12 per cent in their series of urinary tract infections. Epidemic gastrointestinal diseases are caused often by consumption of meat decomposed by these organisms, and B proteus has been isolated in summer diarrhea of children. It has been frequently reported as the primary infective agent in cases of acute and chronic middle ear and mastoid infections.

Our interest in this subject was aroused on the recovery of B proteus from the cerebrospinal fluid both during life and from the mastoid on postmortem examination

The members of the genus proteus are gram-negative organisms, highly pleomorphic and subject to great variation in size. Taylor identified 53 strains isolated from varied human sources, of these he classified 22 as definitely pathogenic, 24 as nonpathogenic, and 7 as of doubtful pathogenicity. Bergey classifies 8 species of the genus proteus. McKee states that Proteus vulgaris and mirabilis are the most important members of the proteus group from a clinical standpoint.

McKee reviewed the literature and noted 18 cases of B proteus meningitis reported up to the year 1941. Of these cases, one (that of Neal and Abramson) was a mixed infection caused by Staphylococcus aureus and B proteus. This case is excluded from our review. We add the case of Ohlmacher (1897), which is the first case reported in the literature, and 3 additional cases, those of Meltzer, Sugar, and Myers. This makes a total of 21 reported cases to date. (See Table 1)

The table reveals that 13 of the 21 cases were secondary to otitis media. Almost all of these were chronic otitis media of long standing with recurrent

episodes of purulent discharge. In 7 of the cases tabulated, the focus from which the meninges were infected could not be determined. One case was secondary to a B proteus peritonsillar abscess.

Seven of the cases had other complications Bacillus proteus septicemia occurred in four, in one of which there was a liver abscess as well. The other three developed B proteus brain abscesses

The mortality rate of all cases reported to date is 76 2 per cent

Case Report

This was the first Lincoln Hospital admission of a 54-year-old Italian housewife to the surgical service for pain in the left ear and left postauricular region. The patient claimed she had suffered from pain and discharge from the right ear since infancy. During the week prior to her admission, the pain became sharper and more unbearable. She refused sulfonamide medication prescribed by her physician and took codeine for relief from pain. She fainted

on the morning of admission to the hospital Physical examination showed a well-developed, obese, white woman in a semistuporous condition On admission the temperature was 102 2 F, pulse 100 per minute, respirations 26 per minute, blood pressure 180/70 The white cell count was 19,500 per cm with 85 per cent polymorphonuclears. There was exquisite tenderness over the left mastoid region, marked nuchal rigidity, and drooping of the left side of the mouth. The left pupil was larger than the right. Both reacted sluggishly to light and accommodation. There was moderate ptosis of the left upper hid. Examination of the right drum revealed no abnormality. The left drum was perforated and a thick, creamy, yellow discharge covered its surface. The normal landmarks were obliterated.

No pathologic reflexes could be elicited All the deep reflexes were somewhat exaggerated. The remainder of the physical examination revealed no unusual changes

Mouquin ²²	1939	Otitia media	None	Recovery
Neter ²³	1940	Otitis media	Septicemia	Died
Cragg ²⁴	1941	Otitis media	Septicemia and liver abscess	Recovery
Meltzer ⁷	1941	Otitis media	Brain abscess	Died
Sugar ^s	1944	Otitis media	None	Died
Myera*	1944	Otitis media	None	Recovery

The clinical diagnoses on admission were acute and chronic left otitls media, scute purulent men-

ingitis and left occulomotor and facial paresis.

Examination of cerebrospinal fluid showed turbid, greenish-yellow fluid under 280 mm HrO pressure. It contained 392 cells per cm. 95 per cent of which were polymorphonuclears. No organisms were seen on direct smear but culture grow the B proteus.

The spinal fluid sugar was too low to be measured. The total protein in the spinal fluid was 600

The urine on admission was cloudy yellow and had a specific gravity of 1 015. It contained 4 pig. albumin 4 plus glucose 4 plus acetone and 10

leukocytes per high power field

The patient was given penicillin intrathecally and intramuscularly as well as sodium sulfadiazine intra venously She received Insulin, and on the second hospital day the urine showed I plus glucose and a trace of acctone. The blood sugar was 173 mg per 100 cc.

The temperature on the second hospital day hov ered between 100 and 101 F The therapy previously described was continued The blood sulfonamide level was reported as 11.8 mg. per 100 cc Another spinal tap revealed the same type of fluid the total protein was 228 mg per 100 cc. the sugar was too low to be determined, and B proteus again was grown in pure culture. Bacillus proteus was recovered from culture of the discharge of the left car Blood culture was negative A bed-side x ray showed areas of rarefaction of the mastoid on the left side.

Streptomyem was given intrathecally in 100,000 units at the end of the second hospital day and 100,000 units intramuscularly for three doses

Mastoldectomy was contemplated but postponed because of the patient's poor condition. She failed rapidly despite the chemotherap; and supportive treatment and died on the morning of the third hospital day

It was the impression of the neurologist that involvement of the left oculomotor and facial nerves indicated that infectious process had spread to the

petrous portion of the temporal bone

Postmortem examination revealed thick turbid fluid in the subarachnoid space over the surface of the hemispheres, particularly marked over the fron-tal and occupital lobes. The posterior fossa of the skull contained a large quantity of thin brownish loul-amelling purulent fluid Pus drained through the left internal acoustic meature around the eighth Delva

The petrous portion of the left temporal bone was opened and the mastoid antrum exposed bony structure was necrotic and contained foul-

amelling pus.

Postmortem cultures taken from the posterior fossa and from the petrous portion of the temporal bone grew B proteus in pure culture This organham was gram-negative and motile grew in ir regular spreading colonies on agar liquefied golatin, split urea, produced H.S. and fermented dextrose and and sucrose, but failed to ferment lactose, mannite and maltose It, therefore is identified as the species Proteus mirabilis

Treatment of B proteus Meningitis

Since the advent of chemotherapy 6 cases of B proteus meningitus secondary to otitis media have been reported in the literature, our case being the seventh Of this total, three recovered and four died, the mortality rate being 57 1 per cent. All of these cases received sulfonamide medication. Our case received in addition penicillin and streptomy cin intramuscularly and intrathecally Surgical drainage was instituted in 0 of these cases and in the seventh (our case) surgery was not performed because of the poor condition of the patient.

Of the 15 cases reported prior to the advent of chemotherapy (7 of which were secondary to otitis media) there were two recoveries and thirteen deaths, a mortality rate of 86 7 per cent. One of the cases which recovered was that of a protous meningi

tis secondary to otitis media.

Despite the paucity of cases reported chemother apy appears to offer a definite improvement in prognosis.

Summary and Conclusion

- The 21 cases of Bacillus proteus meningitis reported in the literature are reviewed.
- 2. An additional case is reported, caused by Proteus mirabilis.
- Of all cases of B proteus meningitis, 62 per cent are secondary to otitis media.
- The case records suggest that chemotherapy is beneficial in the treatment. However no conclu sions can be drawn because of the paucity of cases thus far reported

State Health Head Outlines New Plan

PLANS for decentralizing the State Department of Health to make public health facilities more readily available to the people by operating on a basis of counties rather than the district system, were presented January 23 by Dr Herman E Hilleboe, State Commissioner of Health

Dr Hilleboe addressed the midwinter meeting of the Public Health Association of New York City

The first step in the reorganization will be to replace the 18 district health offices with six regional The regional offices were to be in operation by February 1, he said, and the district offices closed Regional offices are to be in Buffalo, Rochester, Syracuse, Albany, and New York New York will have two regional offices, Dr Hilleboe said, one to serve the surrounding counties and one to serve the

Under the six regional offices, county health offices are to be established in each of the fifty-seven counties, in addition to city health offices

"These regional offices will have for their principal

purpose the provision of consultation service to the staffs of the city and county health departments within their regions, assistance in program plan-ning, development, and operation," he continued "No district services will be given by any of the

personnel assigned to the regional offices, except to people in the counties that have not yet organized a

health department '

During the first year of operation of this system, Dr Hilleboe added, the State Department will concentrate on establishing county offices in seven to ten At the end of the year, he said, the whole State health situation will be re-evaluated and effort shifted to other counties

'It is our sincere hope that over a period of five years we can develop a county health department in every county which has the need and is willing and able to proceed," he said "Those remaining must be regrouped and receive services from neighboring county and city health departments, or temporarily from the State

Surgical Supplies for Europe Sought

R ALLEN O Whipple, professor emeritus of surgery at Columbia University, has been named chairman of a group to make a national appeal to doctors and hospitals for medical and surgical supplies needed in war-devastated areas, the Medical and Surgical Relief Committee announced recently The committee is seeking \$250,000 in direct gifts of supplies and money to carry on its work this year

The appointment of Dr Whipple, who is clinical director of Memorial Hospital, was disclosed by Admiral William F Halsey, president of the committee, which in the last seven years has shipped overseas more than \$1,000,000 worth of medical and

surgical supplies

Dr Whipple said that sixteen prominent medical men had agreed to serve with him on a Medical Advisory Council The council will help to form committees in the United States and ask all doctors, hospitals and pharmaceutical concerns to donate drugs, medical, surgical, and dental supplies and publications for shipment overseas

These materials will be sent to hospitals, physicians, and dispensaries that give free care to the needy

"Practically anything we can spare, they can use effectively to prevent suffering and death," Dr

Whipple explained

"They need all types of drugs, anesthetics, gauze, hospital ware, surgical instruments, penicillin, sulfa compounds, vitamins, and virtually everything which will help a doctor to serve his patients efficiently "

Another outstanding need is for recent medical and surgical textbooks and journals, he said, adding that "some doctors in war areas haven't even seen a medical journal or textbook printed since 1939, and are woefully uninformed of many of the latest medi-

cal advances "

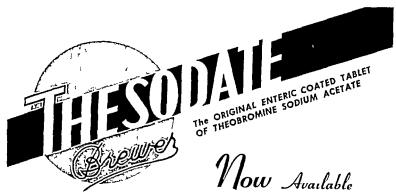

The New York City members of the council, who will assist Dr Whipple are Dr Henry Cave, attending surgeon of the Roosevelt Hospital, and Dr Carnes Weeks, attending surgeon of Bellevue Hospital

Miss Fillmore Appointed NOPHN General Director

A NNA Fillmore, of New York, has been appointed general director of the National Organization for Public Health Nursing to succeed Ruth Houlton, according to an announcement by Ruth W Hubbard, president of the organization

Miss Fillmore has been with the Visiting Nurse Service of New York since 1940, having served successively as staff nurse, supervisor, industrial nurs-

ing consultant, and assistant director
Prior to 1940, Miss Fillmore was director
of the Bureau of Public Health Nursing, Utah State Health Department, and also the assistant director of the American Nurses Association, New

IN AN ADDITIONAL POTENCY

Dr Hawley Heads National Plans

A NNOUNCEMENT has been made of the appointment of Dr Paul R Hawley, former chief medical director of the Veterans' Administration, as chief executive officer of the National Organization of Blue Cross Hospital Service Plans and Blue Shield Medical-Surgical Plans

Dr Hawley will take over his new post on April 1, 1948, with headquarters in Chicago He will direct the activities of the Blue Cross Commission of the American Hospital Association Coordinating Agency for the 91 approved nonprofit hospital service plans in the United States and Canada, and the 48 nonprofit medical-surgical prepayment plans included in the program.

In the New York area the affiliated Blue Cross and Blue Shields organizations are the Associated Hospital Service of New York and the United Medical

Service, Inc.

To Submit Program on Foster Care for Children

SEVEN-POINT program designed to establish a measure of protection for all children placed m foster homes will be submitted to the State Legislature this month by the Special Committee on Social Welfare and Relief, according to a recent announcement by Assemblyman Harold C Ostertag The program is part of a thoroughgoing revision of New York's public welfare system on which the Ostertag Committee has been engaged since 1945

The legislative proposal, Assemblyman Ostertag said, will correct inadequacies in existing law relating to foster care of children and will eliminate certain undesirable practices, such as fee-taking in connection with placements by unauthorized persons or agencies The proposal should further establish, for the first time in State history, an index of the number of children under seven now receiving care away from their own homes Under present laws, no records exist as to the number of children placed away from their own homes with the exception of those placed by authorized agencies or brought into court for adoption

Community Service Society Appoints Seven Psychiatrists

STEP toward enlargement and consolidation of A its psychiatric services has been announced by the Community Service Society of New York City

Anna Kempshall, director of family service, disclosed the appointment of seven psychiatric consultants, to work as part-time staff members giving direct consultation to professional workers in the ten CSS district offices

Dr Peter B Neubauer will head the new unit The consultants are Dr Viola Bernard, Dr Inge Bogner, Dr Richard W Burnett, Dr Paul M Faergeman, Dr Marcel Heiman, Dr Philip Weiss-man, and Dr Gertrude Werner

MEETINGS

PAST

Long Island Surgical Society, International College of Surgeons

Dr Charles Gordon Heyd, attending surgeon at the New York Post-Graduate Hospital, spoke on "Surgery of the Colon" at a meeting of the Long Island Surgical Society of the International College of Surgeons, held at the Long Beach Memorial Hospital on December 16, 1947

Long Island physicians and members of the staffs of Long Island Hospitals were invited to attend the

session

Albany Society for the Advancement of Psychosomatic Medicine

Parents of children who have received help from physicians in psychological problems were guests of the Albany Society for the Advancement of Psychosomatic Medicine at a symposium on "Psychosomatic Pediatrics" held January 17 in Albany

Dr Otto A Faust, director of the department of pediatrics, Albany Medical School, and Dr Marjorie F Murray, associate professor of pediatrics and consultant on psychological problems of childhood, were in charge of the meeting Speakers included Dr

Clinton P McCord, Albany, Dr Edith B Jackson, associate professor of pediatrics, Yale University, and Dr Geraldine Pederson-Krag, New York City

Receipt of an anonymous contribution of \$10,000, to establish a fund for research in psychosomatic pediatrics, was announced by Dr Faust at the meet-

Saranac Lake Medical Society

Dr Carl Muschenheim, associate professor of medicine, Cornell University, Medical College, spoke on "Pulmonary Manifestations and Complications of Cardiovascular Diseases" at a meeting of the Saranac Lake Medical Society on January 14 at the Saranac Laboratory

On January 29, Dr Frank W Cotui, associate professor of experimental surgery, New York University, College of Medicine, spoke on "Recent Advances in Protein Nutrition"

Mount Sinai Hospital

Five scientific papers were presented at the clinical conference held at Mount Smar Hospital January 19. with Dr Arthur S W Touroff acting as chairman

Speakers and their topics included Dr Ralph L Citron, "Recurrent Sublivation of the Cervical Spine," with discussion by Dr Robert K. Lippmann, Dr Max Ellenberg, "Intermittent Diabetes Precipitated by Recurrent Cholecystitis," discussion by Dr Herbert Pollack, Dr Abraham Kaplan, "Parasagittal Meningioma," discussion, Dr Ira Cohen, Dr Harry L Jaffe, "Coronary Occlusion," discussion, Dr Arthur M Master, and Dr R M Berne, "Case for Diagnosis," discussion, Dr I Snapper

New York City Public Health Association

Dr Bert R Boone, senior surgeon of the United States Public Health Service, discussed the work of the service in developing a program for control of heart disease at the midwinter meeting of the Public Health Association of New York City, January 22 in New York

Also speaking at the sessions were Martin Allen Pond, assistant professor of public health, Yale University, Dr Herman E Hilleboe, State Health Commissioner, Dr Harry S Mustard, New York City Health Commissioner, and Dr E H L Corwin, executive secretary of the committee on public health relations of the New York Academy of Medicine

Manhattan and Bronx Chapter, Long Island College of Medicine

Re-establishment of the Manhattan and Bronx Chapter of the Long Island College of Medicine was completed at a meeting of alumni held January 20 at the office of Dr Elias Rauch, New York City

Guest speaker was Dr A W Martin Marino, of Brooklyn, president of the Alumni Association Chapter officers elected are Dr Benjamin Jab-

Chapter officers elected are Dr Benjamin Jablons, president, Dr Nathan Magida, vice-president, Dr Rauch, secretary, and Dr Philip Kassen, treasurer

The next meeting will be held late in February

Brooklyn Urological Society

Dr Frank C Hamm was elected president of the Brooklyn Urological Society for 1948, at a meeting of the group held in January Serving with him are Dr Lawrence L Lavalle, vice-president, and Dr Harold B Hermann, secretary-treasurer

New York Academy of Medicine

Dr Edward J Stieglitz, Suburban Hospital, Washington, D.C., gave the fourth lecture to the laity of the 1947–1948 series at the New York Academy of Medicine, on January 22 His topic was "On Being Old Too Young"

American Social Hygiene Association

Dr Thomas Parran, United States Surgeon General, was the principal speaker at the regional conference on social hygiene of the American Social Hygiene Association, February 4, in New York City His topic was "Are We Stamping Out Syphilis?"

At the afternoon session on clinical and social aspects of venereal disease, Dr Harry S Mustard, New York City Health Commissioner, presided

Eastern New York Eye, Ear, Nose and Throat Association

Dr Fred W Dixon, assistant professor of otolaryngology at Western Reserve Medical College, Cleveland, Ohio, spoke on "Unusual Nasal Sinuses and Their Relationship to Ophthalmology and Otolaryngology" at the meeting of the Eastern New York Eye, Ear, Nose and Throat Association, on February 5 in Troy

Women's Medical Society of New York State

Plans for the annual meeting of the Women's Medical Society of New York State, which will be held at the Hotel Pennsylvania, New York City, May 16 and 17, were made at the midyear meeting of the group February 7 and 8, in New York

Dr Helen Walker, president of the Society, was in

charge of the councillor's meeting

FUTURE

John T Mather Memorial Hospital, Port Jefferson

A teaching day on kidney disease has been arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York for the staff of the John T Mather Memorial Hospital, Port Jefferson, on February 19, beginning at 11 30 A M.

Taking part in the program will be Dr Louis F Bishop, assistant professor of clinical medicine, New York University, College of Medicine, who will speak on "Hypertension and Hypertensive Renal Disease," Dr Edward Craig Coats, instructor in surgery, Cornell University, Medical College, "Suppurative and Calculous Diseases of the Kidneys," and Dr William Goldring, associate professor of medicine, New York University, College of Medicine, "The Clinical Aspects of Glomerulonephritis"

American Otorhinologic Society for the Advancement of Plastic and Reconstructive Surgery

The next regular meeting of the American Otorhinologic Society for the Advancement of Plastic and Reconstructive Surgery will be held at the County Medical Society Building, Philadelphia, Pennsylvania, on February 26 The session will begin at 8 P M

New York and Brooklyn Fracture Committee, American College of Surgeons

The thirteenth annual Fracture Day, sponsored by the New York and Brooklyn Fracture Committee of the American College of Surgeons, will be held February 28 at the Lenov Hill Hospital, New York City, with Dr Preston A Wade acting as chairman Dr Frank E Stinchfield is chairman of the committee for the program

Speakers at the morning session and their topics will include Dr Robert H Kennedy, "Mechanical Problems in Open Reductions", Drs Lester Breidenbach and Jere W Lord, Jr, "Management of Arterial Injuries Associated with Fractures and Dislocations", Dr Russell Patterson, "Thrombophlebitis Associated with Hip Fractures", Dr J Lawrence Pool, "Neurosurgical Aspects of Fracture

MORE RAPIDLY REACHED

MORE ADEQUATELY MAINTAINED

with this Alkalizing

Dual Sulfonamide Suspension

The efficacy and safety of sulfonamide therapy are greatly enhanced through the use of Aldiazol. This palatable liquid preparation provides a suspension of both microcrystalline sulfadiazine and sulfathiazole together with the alkalizing salts sodium citrate and sodium lactate.

Aldiazol leads to therapeutic sulfonamide blood levels more quickly than is possible with ordinary sulfonamides, since its sulfadiazine and sulfathlazole are in microcrystalline form

Recent studies* have shown that the combined unne solubility of two sulfonamides is greater than that of a single sulfonamide since the presence of one exerts little influence upon the solubility of the other. Consequently a greater total quantity of concurrently administered sulfadiazine and sulfathiazole can be dissolved in the unne than of either drug alone, resulting in a lowered incidence of crystalluria and its complications. The presence of alkalies in Aldiazol further reduces the denger of crystalluria. In addition the excreted sulfonamides are largely in non-conjugated form a valuable feature in the treatment of urnary infections.

Aldrazol is indicated in the treatment of many infectious diseases amenable to sulfonamide therapy Being a palatable liquid it is especially useful for children

At the afternoon session Dr William Darrach will introduce Mr H. Osmond-Clarke, London, England, who will give the Clay Ray Murray Memorial Lecture, by invitation Other speakers will be Drs Henry Jordan and Walter Galland, "Treatment of Fractures by Means of Roger Anderson Pm Fixation," Dr Harrison McLaughlin, "Treatment of Long Bone Fractures by Open Reduction," and Dr Edward Winant, "Treatment of Long Bone Fractures by Means of Traction"

Cornell University Medical College

The fifteeth anniversary of the Cornell University Medical College is being celebrated this year, and on March 11 a special Alumni Day program will be held at the College

Included on the program will be registration, luncheon at the Nurses Residence, a business meeting, and conferences in all departments. A dinner dance at the Roosevelt Hotel will conclude the day's program

Long Island College of Medicine

Its fifth postgraduate course in industrial medicine will be presented by the Long Island College of Medicine during the two-week period from April 5 to April 16, under the auspices of the department of preventive medicine and community health

Main objective of the course is to provide physi-

cians engaged in full or part time industrial practice an opportunity to become acquainted with the most recent developments in the field of industrial medi-

Morning demonstrations and afternoon seminars will be held at the College and in representative industrial plants each day during the two weeks, and will cover such topics as "Health Services for Industrial Workers," "Occupational Health," "The Industrial Physician and Health Insurance," "Management of Medical and Surgical Emergencies in Industry," "Rehabilitation of the Injured Worker," "Occupational Diseases," "Respiratory Infections in Industry," and "Surgical Problems of Importance to the Industrial Physician"

Tuition for the entire course will be \$75 Inquiries should be addressed to Dr Thomas D Dublin, Department of Preventive Medicine and Community Health, 248 Baltic Street, Brooklyn 2,

New York

American Academy of Pediatrics

The area meeting of the American Academy of Pediatrics will be held at the Statler Hotel, Buffalo, from April 29 to May 2 Members of state medical societies are invited to attend

Advance registration may be made by writing to Dr C G Grulee, secretary-treasurer, American Academy of Pediatrics, 636 Church Street, Evanston, Illinois, enclosing a check for \$10 for registration fee and banquet, or registration may be made at the time of the meeting

American Dietetic Association

The 31st annual convention of the American Dietetic Association will be held in Boston, Massachusetts, from October 18 through October 22, it has been announced

Meetings in connection with the convention will be held in the Hotel Statler, and exhibition space has been arranged for in Mechanics Hall

PERSONALITIES

Honored

Dr S Edward King, chief of medical service at Halloran Veterans Administration Hospital, Staten Island, recently decorated with the Bronze Star Medal for services in 1944 in the European Theater, entered military service in 1942 and was discharged in 1947 with rank of colonel, served as chief of medical service at various hospitals in ETO, including the 117th, 103rd, and the 300th general hospitals, while in Mediterranean theater, received Army Commendation Ribbon and Order of Knight Officer, Crown of Italy

Appointed

Dr William A Brumfield, Jr, Delmar, director of the New York State Department of Health division of venereal diseases, as deputy State Commissioner of Health, effective January 1 Dr Henry W Cave, New York City, as a vice-chairman of the men's committee of the 1948 Salvation Army appeal

Dr Alvah R Davignon, Loudonville, as a member of the three-man medical board of the State Employes' Retirement System Colonel John A Evans, physician and radiologist at New York Hospital, assigned to 377th Evacuation Hospital, Organized Army Reserve, the Bronx.

Colonel Robert T Findley, New York City, assigned to 320th General Hospital, Organized Army Reserve, New York City Colonel Theodore Golden, New York City, assigned to 333rd General Hospital Organized Army Reserve, New York City

Hospital, Organized Army Reserve, New York City Colonel Benjamin Lubitz, New York City, assigned to 445th Ship's Complement, Organized

Army Reserve, Brooklyn

Colonel Robert D McKay, Brooklyn, assigned to 376th Evacuation Hospital, Organized Army Reserve, Brooklyn Colonel Abraham Norman, chief medical officer, Veterans Administration regional office, Brooklyn, assigned to 334th General Hospital, Organized Army Reserve, Jamaica.

Dr Berwyn F Mattison, director of the Yonkers

Dr Berwyn F Mattison, director of the Yonkers Tuberculosis and Health Association, as first Erie County health commissioner, for a term of six years, beginning January 1 Dr A J Zaia, Oneida City Hospital, former president of the Madison County Medical Society, as a member of the Oneida Board of Health

Elected

Dr James D Tyner, president of the Newark Doctors Association, succeeding Dr Evan Tansley [Continued on page 434]

Loss of vibration sense is one of the most characteristic signs of spinal cord involvement in pernicious anemia. This is a serious complication because it may cripple and disable the patient Early diagnosis of pernicious anemia and intensive, continuous treatment are important factors in preventing spinal cord sclerosis

In administering such vital therapy it is important to make certain that the preparation you employ or prescribe is reliable potent and effective Eminent authorities have pointed out that the use of substandard liver preparations is one of the chief causes of failure in permicious anemia therapy

In the processing of ARMOUR LIVER PREPARATIONS every precaution is taken to preserve the blood regenerating active constituents of fresh liver. The ARMOUR LABORATORIES has been a pioneer in the preparation of therapeutic liver extracts and Armour technicians and scientists are experienced in the processing of the best in animal products.

also elected were Dr Jacob Cohen, vice-president, and Dr Joseph J Kaufman, secretary

Speakers

Dr Arthur J Bedell, Albany, at the Pan-American Congress of Ophthalmology in Havana, Cuba, January 8, where he read a paper on "Hypertensive Fundus" Dr Bedell was recently named a member of the Cuban Society of Ophthalmology Dr Herman E Hilleboe, New York State Health Commissioner, one of the lecturers in the series presented

by the George Washington University School of Medicine, Washington, D C

New Offices

Dr Melvin Harbater, New York City, who served more than five years in the Army Medical Corps, practice of ophthalmology in Utica. Dr Wilbur J Manley, former captain in Army Medical Corps, practice of internal medicine in Olean Dr Selden T Williams, Jr, formerly of Warsaw, New York, now in general practice in Attica

COUNTY NEWS

Albany County

Dr Robert R Linton, associate in surgery, Harvard Medical School, was the guest speaker at the meeting of the Albany County Medical Society January 28 at the Albany College of Pharmacy His topic was "The Surgical Treatment of Hypertension."

New officers of the group are Dr John J Clemmer, president, Dr Edward S Goodwin, vice-president, Dr Albert Vander Veer, 2nd, secretary, Dr Frances E Vosburgh, treasurer, and Drs Raymond F Kircher, Claude C Nuckols, and Christopher Stahler, delegates New members elected include Drs John K. Meneely, Jr, Ray E Trussell, James B Roberts, Irving Gordon, Daniel E Lester, and John C O'Keeffe

Allegany County

On the recommendation of the Allegany County Medical Society, Dr Dorothy Gray, Belfast, was appointed by the board of supervisors as a member of the County Bacteriological Laboratory Board

Broome County

Dr J C Zillhardt, chief of staff of Charles S Wilson Memorial Hospital, Johnson City, was reelected president of the Broome County Medical Society at the annual meeting December 9 in Bingbamton

Dr William B Aten, chairman of the rheumatic fever committee of the Broome County Medical Society, discussed community services available for rheumatic fever victims at a staff meeting of the Binghamton Health Bureau's public health nurses in December

Establishment of a cancer information center in connection with the new cancer prevention and detection program of the Broome County Tuberculosis and Public Health Association has been announced. The center will be located in Binghamton

Chautauqua County

Dr Everett O Black, Fredonia, was elected president of the Chautauqua County Medical Society at its annual meeting in Jamestown Other officers are Dr William L King, Jamestown, first vice-president; Dr Samuel Patti, Dunkirk, second vice-president, Dr Edgar Bieber, Dunkirk, secretary, and Dr C E Hallenbeck, Dunkirk, treasurer

Guest speaker at the meeting was Dr Leslie H Backus, Buffalo, who discussed plastic and reconstructive surgery

Chenango County

Dr John H Hollis, Norwich, was re-elected president of the Chanango County Medical Society at the annual meeting December 14 in Norwich Other officers named are Dr Newton Brachin, Greene, vice-president, Dr John Stewart, Norwich, secretary-treasurer, and Dr J Mott Crumb, South Otsehc, delegate

Dr Robert Karns, assistant director of the State Department of Health, spoke on the problem of poliomyelitis, and led a group discussion. Another guest speaker was Dr Robert Hannon, executive officer of the State Medical Society, who discussed medical legislation.

Cortland County

New officers for the Cortland County Medical Society, elected at the annual meeting December 19 in Cortland, are Dr Robert Henry Kerr, president, Dr Warren J Pashley, vice-president, Dr Edward F Higgins, secretary, and Dr Frank F Sornberger, treasurer

Delaware County

Members of the Delaware County Medical Society have voiced unanimous disapproval of the proposed county hospital and health plan which has been approved by the board of supervisors following a report of the State Department of Health recommending the plan

Suggested by the Hospital Survey and Planning Commission of New York State, the plan recommends a \$503,000 county hospital expansion program at Sidney, Delhi, and Hancock, and the establishment of a county health department and labo-

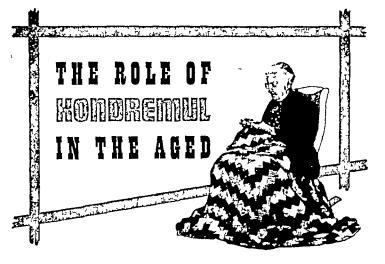

ratory with headquarters at Sidney

The County Medical Society voted to petition the board of supervisors to reject the plan as not workable for the county, arguing that in a centralized hospital patients would be beyond reach of their families, and that their regular physicians would be unable to give them any regular care, thus burdening local physicians The County Society plans to offer alternate recommendations to the county as soon as possible

Fulton County

Dr Malcolm McMartin, Johnstown, was elected president of the Fulton County Medical Society at its annual meeting December 18 in Gloversville, succeeding Dr Francis Hyland, Gloversville

[Continued on page 436]

Other officers elected are Dr Herbert Hageman, Gloversville, vice-president, Dr William Raymond, Johnstown, treasurer, and Dr Robert Lenz, Gloversville, secretary

Genesee County

A new basic fee schedule, effective January 1, has been adopted by four Le Roy physicians, after due consideration of increased costs, it has been announced A similar proposal to establish rates for other communities was discussed at a recent meeting of the Genesee County Medical Society, but no action taken

Minimum charges announced are office visits, \$2 50, house visits from 7 AM to 7 PM, \$3 50, 7 PM to midnight, \$4 50, and midnight to 7 AM,

\$5 50

Jefferson County

Dr Gray H Twombly, assistant professor of cancer research, Columbia University, College of Physicians and Surgeons, spoke to members of the Jefferson County Medical Society at their meeting February 12 in Watertown His topic was "Recognition and Treatment of Pelvic Cancer," and the program was postgraduate instruction arranged by the State Society Council Committee on Public Health and Education

Kings County

Louis I Dublin, Ph D, statistician for the Metropolitan Life Insurance Company of New York, spoke on "Longevity and Mortality of American Physicians 1938–1942" at the meeting of the Kings County Medical Society January 20 at the Medical Society Building

Society Building
Dr A. W Martin Marino, new president of the group, gave his maugural address, 'Pro Bono Pub-

lico," at this meeting

Topic for the February 17 meeting is "Medicine at the Crossroads" and will be discussed by Captain R Harold Draeger of the Medical Corps of the U.S. Navy Former executive officer of the Naval Medical Research Institute, Captain Draeger was selected to direct the medical and biologic research at Bikini during the atom bomb tests

Montgomery County

Dr Raymond E Wytrwal, St Johnsville, was elected president of the Montgomery County Medical Society at the annual meeting in December

Other officers named are Dr R R Violyn, Amsterdam, vice-president, Dr David W Childs, secretary, and Dr Fred F Pipito, Amsterdam, treasurer

surer

Niagara County

A paper on "Pulmonary Embolism" was presented by Dr John Ambrusko, North Tonawanda, at the meeting of the Niagara County Medical Society on January 13 in Lockport Dr W W Pierce, Lockport, newly elected president, was chairman

The Society voted a donation of \$500 to the National Physicians' Committee to assist in the fight against compulsory health insurance. The members were urged to continue their individual contri-

butions.

Orange County

Dr Theodore R Proper, Newburgh, was elected president of the Orange County Medical Society at a meeting attended by 146 members December 10 in Middletown Other officers elected for 1948 were Dr Arnold Messing, vice-president, Dr E C Waterbury, secretary-treasurer, and Drs M A Stivers and W W Davis, delegates to the State Society

Otsego County

Elected president of the Otsego County Medical Society, succeeding Dr Charles B Kieler, Cooperstown, is Dr Edward J Keegan, Oneonta New vice-president of the Society is Dr John W Latcher, Oneonta, and secretary-treasurer is Dr John M Constantine, Oneonta

Richmond County

Topics and speakers for the March Friday afternoon sessions of postgraduate instruction, arranged for the Richmond County Medical Society by the State Society in cooperation with the State Department of Health, will be

ment of Health, will be
March 5—"The Management of the Failing
Heart," Dr Harry Gold, professor of clinical pharmacology, Cornell University Medical College

March 12—"Gastromtestinal Hemorrhage," Dr Albert F R Andresen, professor of clinical medi-

cine, Long Island College of Medicine

March 19—"The Treatment of Burns and Hand Infections," Dr David Goldblatt, associate clinical professor of surgery, New York Post-Graduate Medical School

March 26—"Cancer of the Stomach," Dr George T Pack, assistant professor of clinical surgery, Cor-

nell University Medical College

The lectures begin at 4 30 P M, and are held in the auditorium of the United States Marine Hospital, Stapleton, Staten Island

Schenectady County

"The Use of Cell Smears in the Early Diagnosis of Cancer" will be the topic of a lecture in postgraduate instruction to be presented by Dr George N Papanicolaou, professor of clinical anatomy, Cornell University, Medical College, at the meeting of the Schenectady County Medical Society April 6 at the Ellis Hospital, Schenectady

Sullivan County

Dr Frederick N Marty, assistant professor of clinical medicine, Syracuse University College of Medicine, will speak on "Plasma Therapy and Whole Blood Transfusion" at the meeting of the Sullivan County Medical Society February 25 in Liberty

The program is postgraduate instruction arranged by the Council Committee on Public Health and

Education of the State Society

Westchester County

"The Present Status of Vagotomy in the Treatment of Peptic Ulcer" was discussed by Dr Julian M Ruffin, associate professor of medicine, Duke University, at the meeting of the Westchester County Medical Society January 20 in White Plains

Digitaline Nativelle puts out the "cat"

Dosage by "cat units" is climinated by prescribing Digitaline Nativelle, the chief active principle of digitalis pur purea Digitaline Nativelle affords simplified dosage and uniform car diotonic action is therefore a preparation of choice whenever digitalis therapy is indicated

Digitaline Nativelle affords 5 advantages

- I Uniform potency by weight.
- 2. Identical dosage and effect when given intravenously or by mouth.
- 3 Virtual freedom from gastric upsets and untoward side effects.
- 4 Uniform rapid absorption and action, determinable by the clock.
- 5 Active principle indersed by lead ing cardiologists.

Extraneous substances and their un toward side effects, so common with the use of crude preparations, are vir tailly eliminated by prescribing Digitaline Nativelle, the chief active principle of digitalis

RAPE DIGITALIZATION 1.2 mg. in equally divided doses of 0.6 mg at three hour intervals.

MAINTENANCE 01 or 0.2 mg. daily depending upon putient a response.

CHANCE-OVER 0.1 or 0.2 mg. of Digitaline Nativelle may advantageously replace present maintenance dosage of 0.1 gm or 0.2 gm of whole leaf

For faster uniform action with less "reac tion" prescribe Digitaline Nativelle

Supplied through all pharmacies in 0.1 mg plak tablets and 0.2 mg white tablets—in bottles of 40 and 250 In ampules of 0.2 mg (1 oc) and 0.4 mg (2 oc.)—in packages of 6 or 50.

Digitaline Nativelle

active glycoside of digitalis purpurea (digitoxin)

HOSPITAL NEWS

Alcoholic Center Urged for State

PROPOSAL that the State accept responsibility A for treating and rehabilitating alcoholics and establish an experimental hospital of not more than fifty beds for their care was made in January by the Westchester Joint Committee on Alcoholism

The joint committee, comprised of medical, civic, and religious leaders, recommended that the "pilot" hospital should be established near a heavily populated area where the incidence of alcoholism is high The proposal was made to the subcommittee on the problems of alcohol of the New York State Interdepartmental Health Council in Albany

Dr I Jay Brightman, chairman of the subcommittee on the problems of alcohol, said in Albany that his group would "take the Westchester report under serious consideration"

Dr Brightman said the subcommittee would give to the Health Council a plan for introduction into the Legislature

The Westchester committee said in its proposals that an estimated 6 6 per cent of adult males and 16 per cent of adult females are chronic alcoholics Nevertheless, the committee said, present knowledge of treating alcoholics is so limited, it would be preferable to start on a modest scale and add to it as knowledge advanced

The committee proposals, making a plea for considering alcoholics as ill persons rather than as criminals, recommended that the State social hygiene law be amended to provide for the certification of alco-

holics to public mental institutions

The Westchester committee, whose chairman is
Paul R Brown, warden of the Westchester County
Pemtentiary at East View, was started a year ago by
the White Plans Rotary Club It includes the Westchester Medical Society, the Mental Hygiene Association of Westchester County, the Salvation Army, and Alcoholics Anonymous

General Hospital Beds Planned for Madison County

MADISON County needs at least 130 new general hospital beds—70 of them in or near Hamilton—according to official New York State statistics released recently

These figures were received by Dr William Liddle, chairman of the Public Health Committee of the Board of Supervisors as part of the long-awaited survey by the New York State Department of Health and the Joint Hospital Survey and Planning Com-mission requested by supervisors Additional hospital beds for Madison County was

only one aspect of the over-all health needs of the county dealt with in the survey, which included recommendations concerning a county laboratory and public health department. In discussing the need for hospital beds, however, State officials stated In discussing the

"It is believed that the 130 additional general hos-pital beds for Madison County can be obtained best by adding 60 beds to the existing 80 beds at the Oneida City Hospital, providing a total of 140 beds in the city of Oneida, and by the construction of a new general hospital of 70 beds in the vicinity of Hamilton Village

"The Hamilton community, in the southern part of the county, is a logical place in which to locate general hospital facilities to serve the central and southern sections of the county and the borders of adjacent counties"

Bronx Hospital Admits General Practitioners

PLAN to provide hospital affiliation for quali-A fied general practitioners, who now are largely excluded from hospital staffs, was announced recently by the Bronx Hospital, the Bronx, through its director, Dr Aaron A Karan

Under the plan Bronx Hospital will add to its staffs a general-practice section, the first of its kind m any voluntary hospital in New York Most hospitals in New York are staffed entirely

by specialists
"Bronx Hospital is glad to pioneer this effort in
New York," Dr Karan said "There are approximately 2,100 physicians in Bronx County, of whom 1,600 are members of the County Medical Society Well over half of these have no hospital affiliation in the borough and cannot obtain hospitalization for

their patients except in proprietary institutions"
In the past, Dr Karan explained, voluntary hospitals have excluded general practitioners from their staffs, and it was necessary for these doctors to take their patients to more expensive private hospitals. Only doctors who are members of hospital staffs are allowed to use the hospitals' facilities, thus making it almost impossible for a general practitioner to treat a patient in a voluntary, nonprofit institution, where costs are less than at private hospitals

Capable Hands for your Patient

Your patient at the Spa is in capable hands. The treatment which you yourself prescribe for him is faithfully carried out by a well trained staff.

Here in a restful setting of great natural beauty a person suffering from cardiac, vascular or rheumatic disorders of a chronic nature finds mental and physical relaxation which enables the Spa s naturally carbonated mineral waters to exert their full measure of therapeutic benefit.

Thus the Spa lightens your heavy burden, with added relief in the assurance that your patient will receive the best of care to prepare him for your continued medical direction.

Capable physicians are available in Saratoga Springs for consultation with your patient on the details of the program.

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative cure at the Spa, you, too will return to your practice refreshed—revitalized—ready for the busy days that he ahead For professional publications of the Spa, and physician's sample carron of battled waters with their analyzes write W S. McClellan M D, Medical Director Saratoga Spa, 155 Saratoga Springs New York.

NEWS NOTES

A clinic for peripheral vascular diseases has been opened by the Hospital for Joint Diseases, New York City, according to an announcement by Janice Seligman, supervisor of the outpatient department The clinic, which meets Monday and Friday mornings from 9 to 11 a m, is headed by Dr Isador Mufson

Dr John Pastore, executive director of the Hospital Council of Greater New York, spoke at an open meeting of the Health Council Division of the Brooklyn Council for Social Planning on February 5 topic was "The Master Hospital Plan as It Affects Brooklyn" The meeting was held at the Brooklyn Bureau of Social Services

Dr Thurman Boyd Givan, director of pediatrics at Cumberland Hospital, associate professor of pediatrics at Long Island College Hospital, and senior pediatrician at Norwegian Hospital, Brooklyn, was guest speaker at the February 18 meeting of the staff of Doctor's Hospital in Queens subject was "Prophylactic Measures in Pediatrics"

Dr George R Stuart and Dr Raymond P Sullivan, retiring as directors of the first and second surgical divisions, respectively, and Dr Stanley Brady, retired director of pediatrics, all of St Vincent's Hospital, New York City, recently received gold medals and illuminated scrolls from Francis Cardinal Spellman at a testimonial dinner

Dr Stuart has been associated with the hospital since 1908, Dr Sullivan since 1909, and Dr Brady smce 1926 All are continuing as members of the

senior consulting staff of the hospital

Expansion of the program to develop specialists, in line with a trend evident throughout the nation, is under way at the Syracuse Medical Center, according to a recent announcement by Dr H G Weiskotten, dean of the College of Medicine at Syracuse University

Dr Weiskotten pointed out that there are twentyfour doctors serving as assistant residents at the medical center and nine more as full-fledged resi-

dents in various categories of medicine, including surgery, internal medicine, obstetrics, gynecology, and pediatrics

As an example of the trend toward specialization, he cited the fact that the department of internal medicine has had more than 100 applications for

the four residencies it provides

However, the College of Medicine, while in stride with specialization, has taken cognizance of the need for better prepared general practitioners, and next July, Dean Weiskotten said, will initiate four residencies in general practice

Plans for improvements to Cohoes Hospital and a closer affiliation of the staffs with officials of the institute were discussed at the December meeting of the executive committee and the medical staff Dr A J Vinci, president, and Dr Francis M Noonan, vice-president of the medical staff, attended the conference

The regular clinical conference of Hillside Hospital, Queens, was held at the hospital on February The program was on "Contrasting Mechanisms in Two Patients with Obsessive Compulsive Neurosis," and was given by Dr Hans Kleinschmidt and Dr Gabriel de la Vega

The first Samuel Strausberg Memorial Lecture of the Beth-El Hospital, Brooklyn, was delivered by Dr William Goldring, associate professor of medicme at the New York University, College of Medicine, on February 18, at the Kings County Medical Society Building

Dr Goldring's topic was "The Present Status of Medical and Surgical Treatment of Hypertension" The lecture was in memory of Mr Strausberg, recently deceased, who was president of the hospital

from 1941 to 1946

The Isidore Friesner Lecture of the Mount Sinai Hospital, New York City, was given on February 2. by Dr José Trueta His subject was "The Renal Circulation"

PERSONALITIES

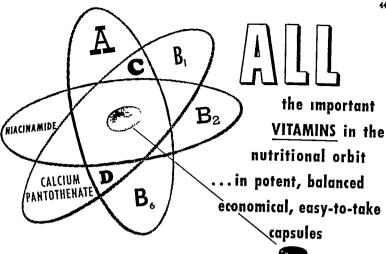

Appointed —Dr Ward L Oliver, Cobleskill, as a member of the Albany Regional Hospital Planning Council To the position of adjunct attending

physician on the medical service of Staten Island
Hospital, Richmond County, Dr Theodore Talbot
Dr Henry Briggin, formerly assistant surgeon, to
associate orthopedic surgeon, St Vincent's Hospital,
Richmond County Dr Herbert C Fett, who
interned at the Long Island College Hospital from 1913 to 1915 and joined the staff as orthopedic surgeon in 1917, as head of the orthopedic department

Elected —As vice-president of the National Committee of Mental Hygiene, Dr William L Russell, consulting psychiatrist at the New York Hospital As directors of the board of St James Mercy Hospital, Hornell, Dr Otto K. Stewart and Dr J Raymond Kell

Dr Morris Eber, Maine, as president of the Endicott Ideal Hospital's staff, succeeding Dr Roger D As vice-president and secretary of the Ideal Hospital staff, Dr John M Mallory and

Dr Michael J Maggiore

CORRESPONDENCE

The Hysteric in General Practice

To the Editor

I wish to comment on the very informative editorial you published in the New York State Journal of Medicine of November 1, 1947, under the title, "The Hysteric in General Practice" In this editorial you discussed an article by the same name written by an English physician, Dr Wilfred Lester, which appeared in the British medical journal, The Practitioner

All praise to Dr Lester for his painstaking piece of work. I feel sure that Dr Lester would agree that his article shows what a "mere doctor without special psychiatric training can do" But I wonder what he would think of your final sentence "If he were practicing under socialized medicine he

could not even try"

I feel sure that he would be shocked if not disgusted, because he himself practices in Great Britain where a form of what you choose to call "socialized medicine" has been in effect for some thirty-five years! Apparently the panel system of Great Britain has not in any way interfered with Dr Lester's ability to cope with an hysterical woman And if, as you say, Dr Lester is a general practitioner without special psychiatric training, the chances are that he himself is participating in that very panel system

So, as I say, your editorial comment was very informative, but not in the way you envisioned. It shows to what extremes the American medical profession is willing to go to blind itself to facts, even to

the point of making itself ludicrous in the eyes of the American and British medical practitioners in order to prevent compulsory health insurance in this country

I wonder how long the doctors of this country will be content to let this distorted type of nonsense

appear in their official medical journals

(Signed) MARTHA MENDELL, M D 201 West 16th Street New York, New York

November 17, 1947

We publish Dr Mendell's comment on our editorial (New York State J Med. 47 2280, Nov 1, 1947) since we think it may represent the opinion of a few others of the medical profession, who find in "socialized medicine" no bar to the maintenance of quality in medical practice. In this particular instance, however, we would call the writer's attention to the illuminating book by Dr. A. J. Cronin, The Citadel. It may change her point of view as to the "benefits" associated with the English Panel System of practice. We do not seem to remember that these benefits included the leisure necessary to make detailed study of individual cases. On the contrary, the system as described by Dr. Cronin seemed to promote the pill and bottle type of practice of which "The Hysteric in General Practice" is the exact opposite, being a most painstaking study—The Editors.

NECROLOGY

[Continued from page 442]

the town of Cornwall He had been radiologist at Cornwall Hospital since 1931 He was a past president of the Orange County Medical Society and a member of the American Medical Association and the New York State Medical Society Dr Thompson was graduated from the New York Homeo-

pathic Medical College in 1908

Paul Henry von Zierolshofen, M D, of Croghan, died on January 20 He was eighty-four years of age In 1887 he was graduated from the New York University College of Medicine He had practiced medicine in Lewis County for sixty-one years and was health officer for the Town of New Bremen and the Village of Croghan He was on the staff of the St Lawrence State Hospital in Ogdensburg and the Lewis County Hospital in Lowville Dr von Zierolshofen was a member of the Military Surgeons of the United States, the American Medical Association, and the New York State and Lewis County medical societies

George Barclay Wallace, MD, of New York City, died on January 15 at the age of seventy-three Professor emeritus of pharmacology at New York University, Dr Wallace was senior member of the faculty at the University's College of Medicine, prior to his retirement in September, 1946, and chairman of the department of pharmacology, which he organized He had been associated with Bellevue Hospital since joining the college faculty in 1902 He was also consulting physician for Harlem Hospital, New York City He received his medical degree from the University of Michigan in 1897

Dr Wallace conducted extensive research on the biologic effects of alcohol, caffein, and anesthetics Recently he had been engaged in the studies of

water metabolism

He helped organize several professional groups, including the Society of Experimental Biology and Medicine, the Harvey Society, and the American Society of Pharmacology and Experimental Therapeutics, serving as managing editor of the journal of the latter society. He was also a member of the American Medical Association, the New York State and County medical societies, the Academy of Medicine, and the American Society for Clinical Investigation.

in weight reduction new evidence of the efficacy of Dexedrine

Excerpts from a recent study entitled, THE MECHANISM OF AMPHETAMINE-INDUCED LOSS OF WEIGHT A Consideration of the Theory of Hunger and Appetite—by Harris, S. C., Ivy, A. C., and Searle, L. M. J. A. M. A. 134 1468 (Aug. 23) 1947

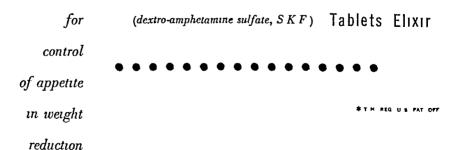

experiment 1 Does 'Dexedrine' Sulfate, by controlling appetite, decrease food intake and body weight in human subjects?

results " our obese subjects lost weight when placed on a diet which allowed them to eat all they wanted three times a day . . . "

experiment 4 Does the rather prolonged administration of Dexedrine cause any evidence of disturbance of tissue functions?

results "No evidence of toxicity of the drug as employed in these studies was found no evidence of deleterious effects of the drug was observed"

Dexedrine* Sulfate

Smith, Kline & French Laboratories, Philadelphia

Experience is the Best Teacher

John William Ballantyne

(1861 1923)

proved it in obstetrics

BALLANTYNE, in his early studies of anatomical and pathological conditions found in the new born, sensed the value of routine prenatal care in obstetrics As a pioneer for prenatal care he was the first to establish a clinic for the expectant mother World wide acceptance of Ballantyne's concepts quickly followed his successful experi ences in prenatal supervision

Experience is the best teacher in choosing a cigarette, too!

MORE PEOPLE ARE SMOKING CAMELS THAN EVER BEFORE!

Yes, experience is the best teacher in choosing a cigarette. Millions of smokers who have tried and compared differ ent brands have found that Camels suit them best. As a result, more and more people are smoking Camels as the "choice of experience."

Try Camela. See if your own taste doesn't appreciate the rich, full flavor of Camels See if your own throat doesn't welcome Camel's cool mildness.

Let your own experience tell you why more people are smoking Camels than ever before.

According to a Nationwide survey:

More Doctors Smoke CAMELS than any other cigarette

When 113,597 doctors from coast to coast - in every field of medicine - were asked by three independent research organizations to name the elgarette they smoked more doctors named Camel than any other brandl

Sedation and Euphoria for Nervous, Irritable Patients

VALERIANETS-DISPERT

Each tablet contains Ext of Valerian 0.05 gm dispergentized for maximum efficiency Odorless and tasteless Non-habitrating ACTION AND USES: A mild central nervous system depressent For use in emotional upsets anxiety states nervous insomnia the nervous syndrome of the menopouse and of arterioscientic subjects.

1 or 2 tablets as required or 3 on retiring. STANDARD PHARMACEUTICAL CO., INC.

Bottles of 50 100 & 500 1123 Broadway, New York

for arterial hyper*TENSION*

Teaching patients how to relax is a primary consideration in the management of arterial hypertension. In many instances this is not a simple task but it can often be made easier by supplementing common sense instructions with Theominal. This slow-acting vascodilator sedative helps to bring about a gradual reduction of blood pressure and through its gentle sedative effect reinforces relaxation.

DOSAGE: The customary dose of Theominal is 1 tablet two or three times daily; when improvement sets in, the dose may be reduced. Each tablet contains theobromine 5 grains and Luminal 1/2 grain.

spasmolytic-sedative relief

in dyamanondia:

When dysmenorrhea is due to myome rial hypertonicity or ex cessive uterine contractions prompt symptomatic relief may be obtained by the administration of—

PAVATRINE

with PHENOBARBITAL

Pavatrine, a safe non narcotic antispashodic agent is unique in its combined neurotropic and musculo ropic relaxing effect on smooth muscle spasm. The inclusion of the mild sedative pheno barbital tends to augment and prolong the spasmolytic action of Pavatrine thereby providing more effective relief.

Other clinical indications include pylorospasm gastrointestinal and bladder spasm

YOU
KNOW
WHAT
THESE
SYMBOLS
STAND
FOR?

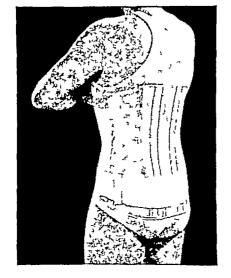

You can depend on any drug product that bears the name Rexult Noah was in at the birth of this symbol Since in almost all lands it has come to mean one thing: Hope See a rainbow in the sky and you see a promise of days less laden with trouble

The familiar Rexall sign is a modern symbols Up and down the land displayed proudly by about 10 000 independent and reliable drug stores it signals an important message to the millions. Here is a symbol it says that assures the highest pharmacal skill in compounding your prescription. It means further that all drugs used are potent pure and uniform all laboratory tested under the rigid Rexall control system.

REXALL DRUG COMPANY

PHARMACEUTICAL CHEMISTS FOR MORE THAN 45 YEARS

a SPENCER for intervertebral disc

In both conservative and surgical treatment of intervertebral disc, the application of a back support is usually indicated *

We invite the physician's investigation of Spencer as adjunct to treatment Each Spencer is individually designed, cut, and made for each patient-after a description of the patient's body and posture has been recorded and detailed measurements taken Thus, individual support requirements are accurately met. The Spencer Spinal Support shown above was individually designed for this man Note outside pelvic binder for added pelvic stability.

For a dealer in Spencer Supports look in telephone book for "Spencer corsetiere" or "Spencer Support Shop," or write direct to us *Barr, Joseph S, Ruptured Inter-

vertebral Disc and Sciatic Pain, Jr.

No other crop could grow here

Vast areas of the country would have to be considered wasteland, so far as human nutrition is concerned, were it not for the ability of livestock to feed on the grasses and roughage growing in the many areas which do not lend themselves to cultivation

Our livestock population turns many plants, in themselves inedible by man, into meat man's preferred protein food

Thus livestock makes land, which otherwise would be useless for human nutrition, produce an outstanding protein food for man This is of added importance today because of the worldwide scarcity of high-quality protein foods

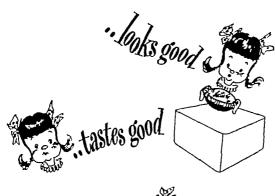

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

THE MODERN ANTISEPTIC AND PALLIATIVE —FOR MOUTH AND THROATI

LORAKON* is Antiseptic: Containing benzalkonium chloride (1 4000) and glycerin in an aromatized slightly alkaline specially prepared isotonic aqueous vehicle-LORAKON is highly potent against six of the more common pathogenic micro-organisms harbored in mouth and throat. (Undiluted, it is bactericidal and fungicidal within 15 seconds.) LORAKON is Surface-Active: Its clinging, foeming action produces immediate and prolonged contact with mouth and throat areas, LORAKON is highly miscible with saliva and nasopharyngeal secretions. LORAKON is Non-irritating. It is harmless to tustues, and slightly alkaline-desirable for protection of teeth. LORAKON is Soothing: It aids in relieving irritation through its emolliency and clinging propensity LORAKON is also refreshing and deodorant, with a pleasant taste and mildly aromatic fragrance. Indicated: As gargle mouthwash, rinse, apray or for irrugation in minor affections of the oropharyngeal area and following pharyngeal surgery Should be used full strength. Supplied: In 8 fluidounce and pint bottles.

RAPID, SUSTAINED BENEFIT in TRICHOMONIASIS

3.31を行

TRICHONAL

racemer

Antiseptic Acid Foaming Tablets

Prompt and sustained benefit in trichomoniasis, leukorrhea, and various types of vaginitis may be conveniently secured by local administration of TRICHONAL* Tablets

TRICHONAL achieves the desired thera peutic results by means of

- LACTOQUINOLINE—brand of oxyquin oline lactate—powerful but safe anti septic;
- KAOLIN in colloidal state assures prolonged effectiveness of medication through adherent property,
- DEXTROSE—provides stimulus to growth of beneficial lactic acid-producing bacteria,
- FOAMING BASE—gradual effervescence aids diffusion of medication throughout entire vaginal tract.

OTHER FEATURES:

- Simplicity of administration Establishes normal vaginal acidity Nontoxic
 - Nonirritating Pleasing odor
 Economy

Each TRICHONAL Tablet contains ½ grain of lactoquinoline and 3 grains of dextrose.

SUPPLIED Bottles of 100 and 500 compressed tablets.

The treatment of ammonia dermatitis (disper rash) here tofore has been a bothersome and unavailing routine of boric acid rinses and rapid change of soiled dispers.

Usually the results have been unsatusfactory - even with the use of bichloride of mer cury because of the risk of mercuric poisoning. The high incidence of disper rash therefore emphasizes the need for a more advanced therapy

Cooket demonstrated that the cause of disper rash is ammonia liberated in the wer disper by bacterial decompoamon of urinary ures. The odor of ammonia is readily detected in dispers wet with urine.

Figure 1 - DARK ZONE OF INHIBITION PIO doord by DIAPENE

CULTURE PLATE OF Bacillus Isolated from B.G (See Fig 2) Disper Resh Dermaticas)

- Tosled for Prescription Use or Doctor's Rocommondation

IMPORTANT:-DIAPENE is as basically necessary as baby oil powder or ointment, because chafing, prickly heat, allergy rashes, etc., are YOURSELF often aggravated by ammoniacal urine, DIA PENE is a prophylactic MUST for every baby!

Acnomel

a significant advance, clinical and cosmetic,

in acne therapy

Now, for the first time, you have a preparation which fulfills the two prime requirements for the successful treatment of acne

- 1 Therapeutic excellence An exceptional vehicle assures the effectiveness of Acnomel's tried and proved active ingredients—sulfur and resorcinol
- 2. Cosmetic excellence Delicately flesh tinted, Acnomel not only harmonizes so well with the skin as to be virtually invisible, but it also masks unsightly lesions. This, plus its pleasant odor, will make your patients like to use Acnomel

Acnomed s therapeutic superiority will please the physician, its cosmetic superiority will please the patient. It is available, on prescription only, in 1½ oz tubes

DERABETA®

plus vitamin C

a new formula of the water-soluble vitamins

Deficiencies of the water soluble vitamins tend to be multiple in nature," and effective treatment or prophylaxis requires administration of all the B vitamins plus ascorbic acid

Capsules Perabeta² plus Vitamin C is a new Sharp & Dohme formula providing all the water-soluble accessory food factors in balanced, adequate quantities, and in convenient, readily assimilated form

Each capsule contains:

,	Thiamine hydrochloride (vitamin B ₁)	3 0 mg
ŧ	Riboflavin (Vitamin B ₂)	3 0 mg
	Pyridoxine hydrochloride (vitamin B _s)	0 1 mg
1	Niacinamide	20 0 mg
	Calcium pantothenate	3 0 mg
	and other natural factors of the B complex from 84 mg	•
	of dried liver including traces of blotin folic acid	
	and inositol	
£ 1	Ascorbic acid (vitamin C)	50 0 mg
	Watering and fargum of	DO O mg

As recommended by Jolliffe³, the entire vita min B complex is provided in the form of dried liver concentrate, not so much because it contains thiamine, niacin and riboflavin, "but rather as a source of other B complex nutrients not yet synthesized"

Indicated for prevention or treatment of water soluble vitamin deficiencies, Capsules Perabeta plus Vitamin C are also useful dietary adjuncts in pregnancy, surgery, febrile states, convalescence, diarrhea and diuresis Dosage of Perabeta Capsules is one or more daily Supplied in bottles of 100 and 1000 Sharp & Dohme, Philadelphia 1, Pa

The Annual Meeting

The JOURNAL again urges all who can to plan to attend the annual meeting to be held this year at the Hotel Pennsylvania, New York City, May 17 to 21 Reserve your hotel room now if you have not already done so, since accommodations are apt to be limited

Our readers will note that this year our April first number will be the Convention Issue To date the commercial exhibits will be the largest in number ever set up for a medical meeting at the Hotel Pennsylvania—132 exhibit booths occupied by some 116 firms all displaying the latest in pharmaceutic products and the most modern equipment manufactured for use in the field of medicine Large scientific exhibit sections will be set up for the first time at either end of the Hotel Pennsylvania's main ballroom, allowing by this arrangement a much more comprehensive scientific exhibit than has been possible in previous years.

The registration desk will be located, as in 1946, conveniently near the center of the meeting, assuring easy access to all points of activity. Our good friends, the exhibitors, who, year after busy year, cheerfully help to make possible our annual meetings by underwriting at least part of the cost, deserve your attention and patronage. They bring for your inspection and information the most recent developments in scientific apparatus, therapeutic modalities, the latest publications, and will cheerfully answer any and all questions about their products.

This year make it a point to come Watch for the Convention Issue of the JOURNAL, April 1, for announcements of the scientific programs, the proceedings of the House of Delegates, the annual reports of committees Plan now to attend, and above all, be sure to make your hotel reservations now, if you have not yet done so

The Chiropractic Bill

Like the traditional bad penny, the bill to license and legalize the practice of chiropractic in New York State has turned up again. Despite numerous unsuccessful attempts to throw a mantle of legality about their "profession," the chiropractors have marshalled their forces for another effort to achieve their objective This time, according to all indications, they intend to bring to bear more pressure than ever

On January 21, a bill was introduced in the legislature by Assemblyman L P Noonan, of Cattaraugus County, which would amend the education laws to provide for a State Board of Chiropractic Examiners whose function it would be to license chiropractors and to regulate their practice. As this is written, there is a prospect that the Noonan Bill may, be replaced or supplemented by another and that a companion bill will be introduced in the Senate. In any event, the principal aims will be the same

The stand of the medical profession on this controversial subject is clear. It holds that the basic theory of chiropractic is false, and in this it has the support of every scientific It maintains that, in dealing with human life and well-being, it is the duty of those men who have been given official authority by the State of New York to practice the healing arts to insist upon adequate standards of qualification Chiropractic 18 the practice of medicine, no matter what the chiropractors say about it The courts of the State of New York have ruled that it is If chiropractors practice medicine, they obviously do so without proper qualifications, because of the fallacy of their philosophy The licensing of an unqualified person does not change by one 10ta the fact that he remains unqualified

There are many more specific objections to the Noonan Bill, or its counterparts The bill would open the door wide to permit practically all present chiropractors to obtain a license without any examination The well-known "grandfather clause" does nothing to winnow the wheat from the chaff, but heenses anyone who has been "chiefly engaged" in the practice of chiropractic in the State for at least one year out of the past How many death warrants will this sign for credulous people with serious diseases who rely upon the "treatments" of correspondence school graduates? What of the betrayal of the trust of the unsuspecting patients to whom a license is an assurance of qualification?

The licensing of chiropractors would be a backward step in the steady progress of the healing arts The high standards set forth in the education law would suffer a severe blow To argue that chiropractors have gained a following among certain individuals and, consequently, ought to be licensed is poor logic Fortune tellers and astrologers flourish, yet no one seriously proposes to give them a license to operate fundamental question is adequacy of train-Let the chiropractors fulfill the requirements of the existing law in this respect, and no person will lift a finger to "discriminate" against them, as they often charge

With these and numerous other objections to the Noonan Bill to point to, the medical profession might rest confident in the assumption that the measure will never succeed. This would be a mistake Past failures on the part of the chiropractors to win legislative support for their bills give no assurance that the present bill will also fail. On the contrary, the present mood of the chiropractors is to bring about the adoption of the bill at all costs. Vigilance and aggressive action are necessary to ward off this threat.

To make their opposition to the bill effective, all physicians should make it their business to write directly to their legislative representatives expressing their views. Letters to the majority leaders of the Senate and Assembly and to the members of the Assembly Committee on Public Education, to which the bill was referred, also would help Assemblyman Wheeler Milmoe of Madison County is chairman of this committee. Letters should be written now. They may be addressed to the legislators either at the Senate or the Assembly Chamber, State Capitol, Albany, New York

This is a matter that cannot be left in the hands of a few people. The voice of the medical profession in all New York State must be raised in loud protest against such harmful legislation.

The chiropractors are flooding the mails with their side of the story. Every physician concerned with the future of his profession should join his fellows in doing the same

Current Editorial Comment

A Correction. In our November 15, 1947, issue¹ we referred editorially to an article published in the New York Times of July 27, 1947, which "reported, together with other matters, grants for scholarships in psychiatric fields recently made available by the National Mental Health Act and administered through the US Public Health Service." The quotation is from a letter received from Dr John Romano of Rochester, a member of the National Advisory Mental Health Council, an advisory body of six physicians who advise, consult with, and make recommendations to the Surgeon General on matters relating to the activities and functions of the US Public Health Service in the field of mental health

Dr Romano calls to our notice that in our editorial we unintentionally misrepresented facts, an act which we regret and hereby rectify Our editorial said that "Apparently the Surgeon General of the U.S Public Health Service proposes, according to the New York Times for July 27, 1947, to devote an appropriation of some \$4,650,000 to the further psychiatric training of social workers." This, as Dr Romano points out, is only part of the story as reported and signed by Murray Illson The complete report is reprinted herewith

Scholarships in Psychiatric Fields

With a grant from the National Mental Health Act, four competitive fellowships valued at \$9,600 will be awarded for the first time by the New York School of Social Work, Columbia University for postgraduate training in specialized psychiatric fields it became known yesterday

Carrying a total appropriation of \$4,650 000 the mental health measure recently adopted by Congress and approved by President Truman is designed primarily to help overcome the acute shortage of personnel in the various mental health specialty fields. The program calls for the establishment of training units in psychiatry, chalcal psychology, psychiatric nursing and psychiatric social work. It provides for grantsin-ald to states for establishing needed psychiatric services. Additional sums were appropriated also for psychiatric research.

Several social work schools throughout the country are to share an allocation of \$200,000 to reinforce the training units in psychiatric

social work under the new mental health plan it was learned. At the New York School of Social Work, which is a division of the Commun ity Seruce Society, two such training units will be established for second-year students attending the institution. There will be eight trainees in each unit

Additional Funds

To expand its psychiatric social work program in line with the aims of the National Mental Act, the New York school already has been granted a sum over \$25,000 Part of the allocation will go toward forming the two additional training units. The remainder will be used to finance the four competitive scholarships

According to Dr Walter W Pettit, dean of the school, the awards will carry a stipend of \$2.400 each and will cover an entire academic year beginning with the graduate school's winter quarter in January, 1948 The institution has set November 1 as the closing date for filing applications for the fellowships.

Candidates must be graduates of an accredited school of social work and must have had at least three years' practice in the profession. The post-graduate fellowship program, Dean Pettit disclosed, will consist of advanced courses in psychiatric social work and case work, combined with a specified number of hours to be given to specialized field work.

In addition to the Columbia University school, two other graduate institutions have received grants under the act for the fellowship courses. They are the Pennsylvania School of Social Work of the University of Pennsylvania and the School of Applied Sciences, University of Pittsburgh.

Nation-Wide Program

The training units to be started in the various graduate schools conform to a plan now being developed by the United States Public Health Service for a comprehensive nation wide mental health program under the recently enacted measure. The Public Health Service's Mental Hygiene Division, directed by Dr R. H. Felix, has been authorized by Congress to allocate the training funds to the several degree-granting institutions.

Terming the recent passage of the National Mental Health Act "most heartening," Dr Felix pointed out that the legislation 'gives us an opportunity to cope on a nation-wide scale with one of America's major public health problems—the seource of mental lilness."

¹ Editorial, "Our Coming Psychiatrists," p. 2408.

"The greatest current barrier to the development of mental health programs as a whole," he said, "is the lack of sufficient and well-trained personnel. It is futile, for example, to consider the establishment of clinics or the expansion of mental hospitals unless there will be trained personnel available to help staff them."

MURRAY LLISON

Male Hormone Therapy The increasing employment of these preparations, often in an indiscriminate fashion, should direct attention to a valuable presentation recently made by C W Dunn of Philadelphia, of which the following is a summary ¹

The clinical results obtained with testosterone therapy in all age groups of males and certain age groups of females indicate that the most valuable and desirable effects of testosterone are related to its action on the constitutional state A deficiency in the constitutional state is the basic and the primary defect existing in testosterone deficient patients All other features, subjective and objective, excluding the underdeveloped external genital state and the disturbance in endocrinous interrelationship present in the climacteric, are aftermath effects and/or are related to the degree of the testosterone deficiency which the in-dividual patient presents Even in these dividual patient presents patients, as the extreme degrees of the developmental effects are overcome, the continuance of therapy is based upon the maintenance of the constitutional state at a satis-Therefore, initially and fifactory level nally, we must evaluate the effect of testosterone preparations on the constitution of The value of testosterone to the patient the human must not be based upon its ability to develop the penis or to activate the waning or the disappeared sexual or psychosex-There are many other causes ual stimuli for sexual incapacity or absence of libido The use of testosterone to stimulate sexual activity in an otherwise normal individual is not advised, and if used, it will be found to be ineffective therapy

The administration of testosterone preparations should be restricted to patients exhibiting clinical and/or laboratory signs of testosterone or androgen deficiency. In patients with a testosterone deficiency it acts

as specific therapy only within the limits of its physiobiologic activity

It appears that underdeveloped testes will increase in size under certain circumstances, namely, youth, the presence of the anterior growth hormone, and the administration of testosterone preparations at a dosage level which only corrects the state of testosterone deficiency ¹

Leap Year The year 1948 is leap year This may have serious consequences for some young medical men who may be caught unaware by more alert designing females of the species. It seems only fair, and possibly our editorial duty, to sound a warning note to our young male readers to be on their guard against surprise proposals of marriage by the opposite sex. It's an old custom

These may come during the winter, when the young man's fancy is supposed to be hibernating and sluggish—a splendid opportunity for a surprise attack from ambush unless security is maintained at all times Recent military training can be a great asset to the young male Let him not forget the principles he has learned

Now as the year advances into spring and the male hibernating season comes to a close, the danger is greater. Then the young man's fancy turns to thoughts with which the predatory female has been toying all winter, and which the songwriters belabor ceaselessly as any one may verify, for who can escape the radio crooner or the juke-box moaners? It is all a well-planned campaign to undermine masculine defenses, whatever else it may be called

Ah, spring! That winter lingers in the lap of, ah, spring in leap year, divisible by four and dangerous to the unwary. Young men take warning! If you have come safely and unattached through January, watch yourselves in February. It's a short month, but don't count too much on that, look at the almanac, full moon on the twenty-fourth, 29 perilous days and the sap beginning to run in the sugar maples in an early spring thaw

This is merely a friendly word of warning. We don't expect it will do much good. But our sense of duty is strong, and we suspect that the human female may exert her customary leap year prerogatives as in the past—despite that new look.

COUNTY HEALTH DEPARTMENTS

EDWARD S GODFREY, JR M.D. Albany, New York

(From the New 1 ork State Department of Health)

THE year which has elapsed since the signing of Chapter 1000 of the Laws of 1946, amending the laws relating to the establishment of county health departments and State aid to counties for health work, has seen the most general interest of local officials in the development of county health departments since the original permissive act of While there may have been more discussion of the subject two decades ago this was so controversial in nature that political bodies and their leaders were loath to take action, and only six county health departments were established in twenty-five years.

By contrast, the past year has been marked by what may be called an eagerness on the part of political leaders and boards of supervisors to take advantage of the new law This has been abetted by the promise of federal aid for the construction of hospitals under Public Law 725 the so-called Hill Burton Act, and State aid to the larger cities and for tuberculosis.

The increase in State aid from a straight 50 per cent to 75 per cent for the first \$100,000 expended. while of relatively little importance to the larger and wealther counties, is a matter of moment to the vast majority It is estimated that the State will meet three-fourths of the total expenses needed for a competent health department in about 75 per cent of the counties a department meeting considerably higher standards than those proposed by the Subcommittee on Local Health Umts of the American Public Health Association

In many other counties the State's contribution will be three-fifths or more of the total, and these countles will be the ones to obtain additional State funds through rembursement for the hospital care of the tuberculous. For the most part, these patients have not been included in the areas served by the State tuberculosis hospitals, and while it is expected that the savings will be ad dressed primarily to intensified effort to eradicate tuberculosis, recognition should be given to better organized and intennfied local health service as being perhaps, the most effective instrument for that purpose.

Only 2 counties, Cattaraugus and Columbia suffer financially through these laws, and they had been treated with special favor in the past That is, they had been granted one-half the oper ating expenses of their tuberculosis hospitals in addition to one-half the cost of their county health departments

In addition to providing the larger grant of aid, Chapter 1000 sought to remove certain provisions of the county health department law which had been obstacles to the establishment of county health departments in the past. The most important of these provisions was the elimination of the mandatory abolition of health officers of towns and villages below 3 000 population, contained within a county health district.

This provision had been added to the law through an amendment passed in 1929, in answer to a complaint that such health officers burdened certain jurisdictions with taxes for their support, as well as for the county health department, and that they performed no commensurate service. It was the habit of the time to belittle the per formance of the part-time health officer in the attempt to obtain full time service, and there were enough "horrible examples" to lend cred ibility to the opinion.

The potentialities of the part-time health officers as obstructionists were entirely overlooked. however, and in my opinion their potentialities for useful service were not recognized were and are, too many of them, but this program was needlessly drastic. The present law is completely permissive The local political units are relieved of both the mandate to keep them and the mandate to let them go The decision is entirely with the smallest unit of government. It is home rule carried to the ultimate.

It seems to me there is an advantage in having a considerable number of on-the-spot practi tioners who have had a modicum of special train ing in public health work, who are alert to local health hazards, and who have a professional, as well as financial, interest in the health affairs of

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on Public Health, Hygiene, and Sanitation, May 5, 1947

the community The development or maintenance of that alertness and professional interest is one of the affairs of the county health commissioners

Another impediment to (or perhaps "excuse for" would be better) the relegating of public health to smaller units of government has been conflict between rural and large city supervisors certain counties of the State, city supervisors equal or outnumber those from the towns, and it has been alleged that those from the city either frustrated the desire of town supervisors to form a county health district exclusive of the city or that they were bent upon throwing the cost of their city health work on the county as a whole The ostensible opinion of the town supervisors was that city health departments maintained certain services (diagnostic and treatment clinics, restaurant and food inspection, etc.) which were of little importance to the rural areas but added materially to the expense of operation

It is difficult to assess either the validity of these objections or the verity with which they reflect the real reasons for mertia. At any rate, it was recognized that, although a county health district might represent only that part of a county, exclusive of its contained cities, and although the costs were only levied on the tax units included in the district, the entire board of supervisors voted on the proposal and on the annual budget of the department

A further development of the home rule principle was therefore proposed and was adopted by the legislature. This permits the supervisors of that area of a county outside cities of 50,000 population to veto a county health district, including such cities, or to vote a district exclusive of such a city or cities. If the supervisors of such a city reject a proposal for such a part-county district voted by the outside supervisors, the city is penalized by becoming ineligible for State and

It remains to be seen how influential this factor has been. I am of the opinion that, for the most part, it has been a cover for partisan and factional rivalries, for fear of State domination, of increased taxes, of State failure to make good on its aid, of opposition from medical men, and possibly of other less tangible things. The fact that the three counties containing cities (one of them over 50,000) that have established county health departments this past year have included the entire county in their health districts seems to belie its importance. The more recent action of Eric County and the City of Buffalo is further evidence in this direction.

Along with the removal of obstructions there are several factors, contributing to increased interest and action, that deserve mention

There can be no doubt that high among these

in importance is the interest and strong leadership of Governor Dewey He virtually initiated the committee which reviewed the status of local health organization in the State and recommended the legislation which was later passed His administrative staff gave untiring assistance in drafting the bills, and his strong support assured their passage

I think it not improper to say that the fact that the Governor and the Legislature are of the same political party, and that this is the majority party in nearly all upstate counties, has certainly been a weighty factor in the improved attitude of boards of supervisors—It has given an assurance of State support which, heretofore, may have been felt to be somewhat doubtful

The State Department of Health has been, since my association with it, as clear of politics as any instrument of government can be Certainly, I encountered no political interference in appointments under the two governors responsible for my appointments as Commissioner

It will be understood, therefore, that I speak in no partisan sense when I make an acknowledgment I think due the party responsible for passing this outstanding advance in legislation and for making it effective. I would do the same for the opposing party if it had done and were doing the job

Backing this legislation, there had to be, of course, a considerable body of favorable public opinion. This has been ably fostered by the State Charities Aid Association and its local tuberculosis and public health committees. Throughout the years they have sponsored improvements in health legislation and have worked for the establishment of county health departments. From time to time they have received an astonishing amount of criticism which they have borne with equanimity

This was especially pronounced during those stormy days of the Cattaraugus County demonstration and the troubled aftermath. The Association's linkage with the demonstration, by some curious transference, was supposed to link them with the demonstration director's ideas on health insurance.

At any rate, among other objections leveled at county health departments were that they would be run by the State Charities Aid Association and that they would be an opening wedge for what Dr Frank W Laidlaw, State District Health Officer, used to call "state medsun" It has taken a good while to free the medical mind of these delusions and to recognize the true worth of the local committees and its central office. They constitute a powerful force in molding public opinion for the good against the bad and in obtaining effective action.

Another force back of the legislation was the favorable attitude of the medical profession. The Medical Society of the State of New York had passed a resolution favoring county health departments some years before, I believe, during Dr. George Cottis' term as president, but I had seeing this represented a deference to Dr. Cottis rather than any real belief in the doctrine. Its reitenation by the House of Delegates, in 1944, gave strength to it and indicated a continuing favorable interest.

The fundamental reason for the existing favorable political and medical attitudes lies in the satisfactory experience with the county health departments that have been operating. The youngest of them is now nine years old, and with the exception of the early years of the Cattarau gus County demonstration they have lived up to the expectations. Even in the darkest days of the early 1930 s, when budgets were being out universally, those of the county health departments suffered less than most of the unorganized counties in their nursing service. Even in the darkest of those days, there was no movement to revert to the former part-time system.

This record has made its impression on the supervisors of other counties. I believe I am correct in saying that every supervisors committee that has visited county health departments has been favorably impressed by what they saw and heard regarding the establishment of the departments. Although this has rarely led to action at the time, its effect is being demonstrated now. Actual performance by going concerns has served not only to allay earlier suspicion but to demonstrate true worth.

This comment applies also to the improvement and expansion of our district offices. As I said nearly three years ago, they are "demonstrations of the worthwhlleness of qualified personnel and full time service." The quality of the men and women that the State Department of Health has been able to recruit and train over the past fifteen years has had a large share in setting the stage for autonomous full time service for the whole State

The better control of water and milk supplies, the better directed and supervised nursing services, and the improved handling of venered diseases and tuberculosis through the district offices have been visible throughout the State. These offices have given a wider spread to an understanding and appreciation of full-time, qualified service than would be possible through a smaller number of county health departments.

To those who have served in these offices, to those who have dealt with them, and to those who have benefited by their work, these offices need no justification. Apparently, they do need to be

defended elsewhere—among theorists more concerned with organization than performance Admittedly, compared with county health departments, these offices have shortcomings, as they have been financed and developed in this State.

We are aware of these shortcomings, some of which Dr V A Van Volkenburgh Assistant Commissioner of Health, recently enumerated in his paper at Ann Arbor, Michigan ¹ But to display a map indicating New York as a benighted territory with only three dispersed areas (outside the large cities and the district adjacent to New York City) having health service worthy of mention tends to become irritating

It is true that the Subcommittee on Local Health Units gives a fair picture of conditions in its written description of New York and supplies a word of caution "against drawing qualitative conclusions from these quantitative data," but the uncritical are quite likely to do just that 1:1 think it is not only unfair to the State but is, especially, unfair to the men and women who have been and are performing health services that compare favorably with those given in states plastered with "3- and 4-nece units."

I do not look with favor on another item in the Subcommittee's report, i e., that one recommending multi-county districts. I think it is much more sound to accept established minor civil divisions as they are, until more pervasive reasons cause them to be changed The rates of consoli dation and separation among such districts should be investigated and reported before being adopted as a policy The districts shown on the map of this report represent a desirable number of State districts, not autonomous multi-county "units." The difficulties in obtaining agreement in the first instance, the foreseeable contentions as to headquarters personnel, and budget, and the confu sion arising from a divorce seem more formidable and more wasteful than attempting to find good use for a full-time health commissioner in a county of less than 50 000

Dr Van Volkenburgh indicated 3 lines of development which would not only benefit the people of the county but would be satisfying to a qualified health officer! I quote from his paper

"One method is to establish a county general hospital with State and federal subsidy which would also house the county health department and county laboratory facilities, the health officer to serve in a dual capacity as superintendent of the hospital, with the aid of an assistant superintendent. Such an arrangement should provide desired coordination between preventive and curative services in the county. At least 8 of these counties lack satisfactory hospital bed facilities. For 1 of these countres, a plan, complete in

all details, has been prepared in accordance with the above suggestion

"Another method is the combining of the school medical inspection and nursing service with the work of the county health department. School services in this State are provided by local school boards through contract with local physicians and school nurse teachers. Such contracts could be made with the county health department.

"Still another method is intensification and more universal provision of public health services. It has been our experience that these small population rural counties have greater need of public health services and require more personal attention than do more populous and prosperous counties.

"It is believed that every effort should be made to develop single county health districts and avoid multi-county units in New York State. The economic factor has largely been removed by State and since such counties now can be reimbursed 75 cents for each dollar expended on health work. If more financial and is necessary, it is possible to supplement further with federal funds granted to the State."

These functions would bring the health department and especially the commissioner into closer relation with the public and the practitioners of the county It should materially improve the quality of the medical examinations and the follow-up examinations of children with defects, and, most of all, it should obtain a larger proportion of corrections of defects than has been usual The special services provided by the State Department of Health would be used earlier and more frequently, and I feel sure that arrangements would be made with the county medical societies for the use of the staff and facilities of the county hospitals to the advantage of both patients and practitioners It seems to me to be a challenging opportunity to one with sincerity, diplomacy, imagination tempered with common sense, and ambition controlled by good judgment

Up to April 1, 1947, 5 county boards of supervisors had voted to establish county health departments, 7 had requested surveys looking toward such an action, and 10 had shown an interest which may be translated into action in the not too distant future. The State administration has indicated its willingness to spend \$14,000,000 in aid of local public health work, including hospital care for tuberculosis. The State Department of Health is ready with whatever technical assistance it can give and is ready to aid in the difficult task of finding suitable personnel to give the quality of service the State deserves

It is hard to see how the State can go much further Its most effective propaganda will probably be in continuing good health work, improving it if possible, and in conferring with key people in the cities and counties that will be affected. The agitation and the initiative should come, as definite action will have to, from the people who will pay the local share of the cost and who will profit most by the service

Discussion

W A. Holla, M D, White Plains —I would like to discuss this paper from an angle somewhat different from that usually followed. You have heard from Dr. Godfrey how the situation appears from his vantage point. Let me explain how this same problem appears to one who is administering the actual operation and attempting to carry out the instructions from the Albany office, and how these two viewpoints vary.

These comments are based upon seventeen years of experience in a county health district, operating since 1930, under State aid with State Health Office The county health district district supervision population exceeds 300,000, and population densities range from 51 persons per square mile to over 11,000 persons per square mile, with an average of The area is 425 square miles The location is in 711 the New York City metropolitan area The county program is affected by proximity to New York City and about 40 per cent of our wage earners work in that city Frequently, the New York City program is at variance with state policies

The following are the chief criticisms as seen here I Authority for local control of realty subdivisions by county health department is without adequate basis in State law Local county control legislation was passed in 1934 Paragraph 89 of the Public Health Law, enacted in 1933, does not apply in Westchester

II The State policy relating to Article V, Public Health Law, entitled "Potable Waters," needs to be revised

- (A) The State is uncertain as to applicability to nonpotable waters
- (B) The application to industrial waste is not clear
- (C) The County sanitary engineers are not always consulted regarding approval of plans for sewage treatment
- (D) The application of the law to discharges of wastes "to the waters of the State" has been interpreted to include ground waters. This is not necessarily correct, since the law further limits such control to such discharges "in quantities injurious to the public health". This county issued 800 permits, in 1946, for small sewage disposal systems not approved by the State. None of these discharge directly into streams or natural bodies of water, yet our authority to issue such permits has been questioned.
- (E) Chapter VII of the State Sanitary Code should not require State approval of camp sewage disposal facilities by the State in counties or cities having sanitary engineers

(F) The new condition of State sewage discharge permit attempts to control industrial wastes by inferring their inclusion in the category of "Sanitary and domestic sewage."

 The county health department wants to conserve millions of dollars of investments in sanitary sewers designed only for sanitary sewage, not including in

dustrial wastes.

(2) The State has proposed discharge of industrial wastes to such sanitary sewers, rather than to natural bodies of water, after suitable treatment. This does not appear reasonable since

(a) Sanitary science can devise any degree of treatment needed for the protection of natural bodies of water

- (b) The State has long maintained an official attitude of indifference to the broad problem of industrial wastedisposal. If this policy is being changed local health units would appreciate the opportunity to discuss the local aspects of such problems.
- (G) The State laws relating to approval of public water supply systems should be consolidated

under public health laws.

- (1) Existing laws affecting such systems in clude the Public Service Commission Law State Conservation Law Public Health Law Sanitary Code and State town, village, and city laws
- (2) Existing laws requiring local regulations to provide adequate public health protection have loopholes or are not en
- 100000
- III Sanitary control of milk and milk products (A) State Department of Health control should not be subordinate to other laws, such as agriculture and markets or New York City Westchester Country had to obtain an injunction in 1946 to keep New York City from grabbing more than their share of the milk supply
- (B) The State Department of Health practically ignores animal disease control in dairy herds

 The present agriculture and markets program on mastitis is not coordinated

with health department work.

(2) The local county veterinarians' are employed under agriculture and markets law not health law There are no veterinarians, employed as such, in the State Department of Health.

(C) There is no State-wide dairy farm inspection

control program

 The development of a large number of adequately staffed county units may obviate a State-wide dairy inspection law but the coordination of control should be through or by the State Department of Health

8 Sanitary control of food production

(A) The State Department of Health has no program, except for restaurant sanitation, a relatively minor phase of this work.

- (B) Local health units cannot ignore problems rather they must work out their own program without State support and must achieve cooperation with other agencies, such as State agriculture and markets labor and education departments. Federal Food and Drug Administration, U.S.P. Health Service (shellfish), and the State Conservation Department (shellfish) Such agencies frequently shrink from contacts with local health departments because of the many mistakes and misunderstandings which have arisen as a result of the lack of uniform State food and drug control and the lack of support from the State Department of Health
- (C) Recognition of qualifications for sanitation personnel in the field of food control is expected in the proposed Section G Chapter VI of the State Sanitary Code which will probably be adopted shortly by the Public Health Council.

(D) Local food control programs are needed for the following purposes

- To provide information relative to food sources and sanitation of premises when it is necessary to investigate food-borne illness.
- (2) To maintain sanitary control of food plants to prevent outbreaks of food borne illness. No outbreaks of illness due to faulty bakery sanitation have occurred since 1934 in our county This is believed to be due to a number of factors. not the least of which is the inspection service, maintained by the Health Department. A similar parallel exists in the drastic reduction in sewage over flows which fifteen years ago were the principal source of complaint to the department. This reduction has been obtained by requiring approval and inspection of all small sewage disposal systems as they are installed.
- (3) To control food plant sanitation by other agencies, particularly the State Department of Agriculture and Markets, is not adequate in our area. Numerous 'actions' have been undertaken by the county health unit. It may be interesting to note that there is evidence that watering of milk has been increasing during recent years. Although this practice has been considered only as a violation of agriculture and markets laws, the fact romains that the bacterial quality of milk, delivered to consumers has steadily declined since 1942

V Integration of State Department of Health policies with local health programs

(4) Under State aid certain local activities have been listed as not reimbursable, i.a., insect and pest control weed control, control of air pollution and possibly other projects, such as participation in local housing programs or the establishment of local food analytical laboratories. (B) Chapter VIII, State Sanitary Code, relating to nuisances, is obsolete and impractical, yet it was the subject of a number of questions on a recent Civil Service examination for sanitary engineers

(C) Local health units are rarely advised of proposed amendments to State laws, directly affecting them, until the bill is passed

The State Department of Health is urged to recover much of the jurisdiction over environmental sanitation which appears to have been lost to other State agencies It is believed that the State Department of Health should have sufficient authority to

- (A) Control all types of sewage and industrial waste discharges
- (B) Determine the adequacy of and specify required treatment of all public water supplies
- (C) Establish a State-wide control of food and drugs, sufficient to supplement the Federal Food, Drug, and Cosmetics Act, with provision for local units to supplement local health programs
- (D) Establish State-wide coordination of local health programs and provide hason between local units, and between local units and all State or federal agencies with which they must coordinate their activities

Wendell R. Ames, M.D., Olean —Dr Godfrey has very nicely summarized the new legislation, regarding the establishment of county health departments and State aid to counties, and he has described the new impetus that has been given to the formation of county health districts in New York Most or all of us who work in counties so organized are stimulated by these events and derive a certain sense of satisfaction from them After all, we would not be in that type of organization unless we felt that it had something substantial to offer in the way of service to the community The county or full-time city health department is, of course, primarily a service organization

Those of us who operated small or medium-sized county health departments under the old provisions of the law find ourselves in the peculiar position of not noticing a great deal of change resulting from the new legislation This, I believe, is due to the fact that the new legislation did not The increasing affect us much, except financially costs of operation and the demand for new or increased services were counterbalanced, at least in the small and medium-sized departments, by the increase in the reimbursement rate But I wonder what pressure we would now be under if that increase in revenue had not become available when it did?

I do not feel able to comment on some of the other legislative changes In Cattaraugus County only the 2 cities, and 1 village which happens to be partly in an adjacent county, continue to have their own part-time health officers We have an excellent relationship with all 3, and I agree with Dr Godfrey that there is a definite place for part-time health officers I would emphasize, however, that full-time service has not yet been established and used enough, in spite of the excellent recent progress reported

There seems to be a certain amount of conflict between the urban and rural areas of many counties, and between adjacent counties Limiting the basic health district to a single county and providing for optional inclusion of the urban center or centers recognizes this intangible but very real situation

I would comment on another perhaps intangible

but real situation. The present legislation can be

still further improved, in my opinion The object of the establishment of a county health department is, as I see it, to centralize the major public health services of the local government units into an agency with the hope, usually realized, of getting better service Tuberculosis hospital and public health laboratory services may be included, often they are Whether to include them is a decision that must be made locally in the light of the available in-But the ceiling on State aid for both of these services is embarrassing to the administrator if he has the responsibility for them Obviously, it is easier to secure appropriations for items that are reimbursable at 75 per cent than for items reimbursed at 50 per cent or less The present law that provides for State aid to laboratories makes it possible for a city laboratory to contract with a county, and, jointly, they may secure \$15,000 in State aid, whereas if the laboratory becomes an integral part of a county health department, only \$7,500 in State aid may be secured Larger counties establish branch laboratories and in so doing circumvent this difficulty Smaller counties, however, may have this difficulty Where study shows that a laboratory should be an integral part of a county health department, the department should not be penalized for making a progressive move It should be

Dr Godfrey mentioned the present favorable atmosphere—medical and political—for county health departments and commented upon the effect of existing county health departments and the effect of the State district offices in creating this atmos-The district officers, particularly, should be commended for their excellent work The difficult 10b of coordinating several health services, organized at different levels of local government under different bodies, or entirely outside of the governmental framework, and then stepping in to fill the deficiencies, requires much more than ordinary training, ability, and initiative

A word of warning and a request Dr Godfrey's remarks about the stormy days of the Cattaraugus County demonstration indicate that all is not always sweetness and light I believe that a great deal of similar difficulty will be avoided by building our public health program on a sound basis of popular understanding It should not be sold to one or another powerful group in the community I would also like to see a much closer working relationship developed between the State Department of Health and the local full-time departments

WILMS' TUMORS

HANS R SAUER, M.D., Buffalo New York

(From the Department of Urology of the Roswell Park Memorial Institute)

VILMS tumors are the most commonly encountered renal neoplasms of child hood, and it may be assumed that with a few exceptions kidney tumors of children, described as arcomas or carcinomas, belong to this type of malignant new growth. The complexity of the histologic picture accounts for the confusing terminology which includes terms like adenosarcoma, embryonal sarcoma, teratoma, myochondro, rhabdo-, or myxosarcoma and others.

Numerous theories have been advanced as to the origin of Wilms' tumors. It was Wilms idea that these tumors arise from scattered nests of undifferentiated germinal tissue which are deposited in the kidney anlage during the earliest period of embryonal life.1 In contrast, Ewing assumed that Wilms' tumors are derived from the renal blastema or nephrotome after the organ luss been separated from the rest of the urogenital ridge of the embryo A theory advanced by Dean and Pack is of particular interest because of its clinical and prognostic implications. They believe that Wilms' tumors may originate at various developmental periods of fetal life. The formation of smooth or stricted muscle fibers, cartilage, fat, as well as tubular and sarcomatous cell elements, is attributed by them to the multipotency of the urogenital ridge, while primitive glomeruli or primitive renal tubules may be identi fied if the higher developed nephrotome is the predominant constituent source of the tumor

Although Wilms' tumors may be found in any portion of the kidney, they are most frequently encountered in its lower pole. They are best com pared to biologic parasites which cause destruction of the host organ within a short space of During the early stages of the disease the tumor is surrounded by a dense fibrous tissue capsule which separates it from the kidney pa renchyma. This capsule is intimately connected with the renal substance, making it impossible to separate the tumor from the kidney without tearing away some of the renal tissue unlargement with progressive compression atrophy of the remaining kidney parenchyma is the rule. Some of these neoplasms may attain enormous proportions, and, although located retropentoneally, they may occupy the entire abdomen with resultant displacement of intestines, liver, or spleen. Elevation of the dia

phragm on the affected side is common. Wilms' tumors weighing over 30 pounds have been reported. However, these monstreames are exceptional, and tumors of infant head size represent the dimensions more frequently encountered (Fig. 1)

Fig 1

Rupture of the tumor capsule may occur fairly early, but in some instances the tumor attains considerable size before the continuity of the capsule is destroyed. As soon as the capsular barrier has been broken, rapid aggressive invasion of the neighboring structures occurs. Involvement of the remaining kidney substance, kidney pelvis, and hilus with its blood and lymph vessels is common, as is invasion of the adjacent organs. such as the duodenum, pentoneum, vena cava. diaphragm, and even the ureter Distant metastases, usually blood-borne, occur, almost invariably a short time after the tumor has perforated the capsular barrier Metastatic involvement of lungs and liver is most common, but any organ. including the skin, may be the site of metastatic

On section, Wilms' tumors present a glistening appearance. They are grayish-pink in color In large size tumors discoloration of the growth, due to hamorrhages and necrosis, is frequent. In these advanced stages, the neoplasms are bluish red in appearance, and they are of grumous or gelatinous consistency with interspersed areas of cystic degeneration.

Although Wilms' tumors comprise approxi mately 20 per cent of all malignant neoplasms in children, their occurrence is rather uncommon?

Presented at the 141st Annual Recting of the Medical Society of the State of New York Buffalo Section on Pedistrics, May 9 1917

By way of illustration, Memorial Hospital reports only 80 cases, Children's Hospital, Boston, 60, and the Mayo Clinic, 39, 52 cases were collected by Campbell from the services of various New York hospitals 3-6 Our records reveal 16 children with Wilms' tumors admitted to the Roswell Park Memorial Institute during a thirty-year period This represents an incidence of only one case in about 3,500 patients admitted

A study of our comparatively small series of cases indicates essential agreement with statistical data presented by some of the aforementioned authors There was no significant difference in sex or the side involved Nine of the 16 patients were boys and 7 were girls The left kidney was the site of the tumor in 9 patients, as compared with 7 patients having right-sided lesions average age in our group of cases was thirty-five and eight-tenths months at the time when the first symptoms of the disease became manifest, with 9 of the patients ranging from two to four years of age The youngest patient was a newborn infant with metastatic tumor growth (Fig 2) and the oldest patient was eleven years of age

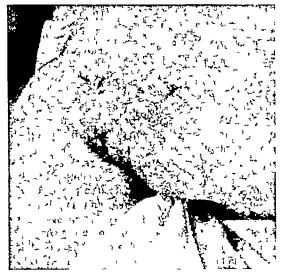

Fig 2

Signs and symptoms of the disease are almost invariably absent during the early stages of Wilms' tumors. Encapsulation of the neoplasm is the reason for the absence of hematuria, the most constant early symptom in cases of adult-type renal tumor. By the time a Wilms' tumor produces symptoms, it is almost always well-advanced.

Visible enlargement of the abdomen or a mass felt in one side of the abdomen represents the usual first manifestation of the disease. Such a mass may be detected accidentally by the mother or by the physician when examining the child for apparently unrelated symptoms.

Insidious growth of the tumor is the rule, but overnight development of a mass, due to massive hemorrhage into a previously undetected tumor, may occur occasionally 6 As the tumor increases in size symptoms develop as a result of compression or actual involvement of adjacent There may be pain, vomiting, jaunstructures dice, and changes in bowel habits, such as diarrhea or obstructive symptoms Fever, either of the intermittent or of the high continuous typhoidal type, is fairly frequent in occurrence Tortuous, dilated superficial abdominal veins, commonly associated with ascites and rapidly progressing cachexia, indicate the approach of the terminal stages

Urinary symptoms such as hematuria, frequency, or dysuria, occur mostly during the more advanced stages of the disease Hematuria need not originate in the tumor proper but may ensue as a result of congestion of the remaining kidney parenchyma ^{3 6}

The occurrence of hypertension as one of the symptoms of renal embryomas has been described more recently by various authors ¹⁻¹⁰ This symptom is attributed to the liberation of pressure substances by the tumor, but may also be the result of renal ischemia ^{8 9}

The symptoms encountered in our series of 16 cases were, in the order of frequency mass in loin, 13, abdominal pain, 8, gastrointestinal disturbances 3, fever 3, hematuria 3, and metastatic skin tumor, 1 Six of the 16 patients had demonstrable distant metastases at the time of diagnosis, and 8 of the remaining 10 cases had faradvanced primary lesions

The diagnosis of Wilms' tumors is rarely made during the early stages of the disease. As long as the growth is confined to its capsule and to the kidney, there are usually no local symptoms and the patient's general condition remains unimpaired. Only in isolated cases is early recognition of the disease possible, such as when suspicion is aroused by an acute incident as hematuria, sudden hemorrhage into the tumor, or pain due to torsion of the kidney pedicle.

In contrast, comparatively little difficulty is encountered in recognizing the tumor after it has progressed far enough to produce symptoms which warrant investigation. The presence of a mass in the kidney region is often sufficient evidence to arrive at a diagnosis of Wilms' tumor. While in some cases the tumor may be so large that it can be readily detected on inspection of the abdomen, there are others in whom examination under anesthesia is necessary before the tumor can be palpated. Urologic investigations consisting of excretory urography or cystoscopy with kidney function tests and retrograde pyelograms are essential to confirm or disprove the diagnosis

Also barium enemas and x ray studies of the gastrointestinal tract are of diagnostic value inasmuch as such an examination may reveal displacement or obstruction of the bowels due to involvement by tumor growth

It cannot be emphasized enough that one should not resort to aspiration biopsy, needle puncture, or exploratory bropsy, because such a procedure must cause destruction of the continuity of the tumor capsule, thus reducing the chances for possible cure. On the other hand, biopsy from a readily accessible metastatic lesion is not harmful, and its use should be advocated in certain cases as an easy method to establish the diagnosis. As an illustration, removal of a metastatic skin lesion, the only sign of the disease in a newborn infant, confirmed the diagnosis in one of our cases several weeks before the primary tumor was palpable.

Other signs and symptoms of renal embryomas, such as fever or hypertension, are not characteristic of this disease alone and thus are of limited diagnostic value. Diagnostic aid can be expected from Papanicolaou stains of the urnary sediment only in certain cases, namely after the tumor has invaded the kidney pelvis. In these cases it is possible to make a pathologically confirmed diagnosis. However, it must be kept in mind that such a method cannot yield results as long as the tumor is confined to its capsule.

Rapid progression of the lesion after onset of symptoms is the rule. This accounts for the fact that comparatively little time elapses in most of the cases between initial symptoms and recognition of the lesion. In our series of 16 patients, the average duration of symptoms up to the time of diagnosis was only two and a half months. In 13 (81 per cent) of them, diagnosis was made in less than two months after onset of symptoms, and in the remaining 3 cases, symptoms persisted for three, nine, and thriteen months before the diagnosis was made. Yet, in spite of comparatively little delay in diagnosis, it was found that 7 of the 16 patients had metastases at the time of diagnosis.

These data are in agreement with those of Campbell, who found that the time interval between onset of symptoms and diagnosis was less than two months in 37 (78 per cent) of 47 patients. Yet, in spite of the shortness of time elapsed between initial symptoms and diagnosis, it must be understood that one cannot consider these 'carly' diagnoses. It has to be kept in mind that, with few exceptions, every case of Wilms tumor is more or less advanced as soon as it changes from the asymptomatic to the symptomatic stage. This, together with the fact that renal embryomas consist of embryonal cells which possess an inherent property for rapid and destructive

growth, account for the poor prognosis in any case of Wilms' tumors

Figures presented by various authors indicate an ultimate mortality rate of more than 90 per cent with the duration of life lasting from five to eighteen months from the time of diagnosis. 6,11 12 Slightly better results are reported by Priestley and Schulte, who reported a five-year cure rate of 15 per cent (39 cases) Ladd and White claim cures in approximately 25 per cent (60 cases) of their patients.4 The results accomplished in our series of cases are most discouraging. Fifteen of our 16 patients died of the disease, and only one patient has remained alive and well for more than ten years. The average duration of life in 14 cases in whom the time of death could be deter mined was seven and eight-tentlis months after diagnosis Eleven of them died within the first six months and 3 patients died after fifteen twenty-seven, and thirty three months, respectively

It is obvious that the unsatisfactory results obtained are most challenging to the medical profession. While no disagreement seems to exist at the present time as to the pathologic characteristics, diagnosis, or clinical course of the disease, there is persistent controversy regarding the most promising method of treatment of Wilms' timors. Among the common forms of therapy employed are (1) nephrectomy alone (2) irradiation alone, (3) irradiation followed by irradiation and (5) nephrectomy preceded and followed by irradiation.

It is difficult, if not impossible to state which method of treatment should be given preference or in which order a combination of treatments should be carned out. The number of cases receiving identical treatments which form the basis for various statistics is too small to permit conclusions as to the superiority of any one procedure. Ladd and White, who believe that their unusually high five-year cure rate was due to employment of early ligation of the pedicle while carrying out transperitoneal nephrectomy with out preliminary irradiation, have remained unduplicated by previous or subsequent statistics, based on a substantial number of cases. It cannot be determined at the present time whether their favorable results should be attributed to coincidence or to the method employed. It is of interest in this connection that Donn attained an identical five-year cure rate in 5, or 25 per cent of 20 patients who received irradiation alone. These quite controversial observations indicate that coincidence may play a part in influencing the author's opinion, and caution should be employed in accepting conclusions as long as they must be based on a limited number of patients.

It seems best to be less dogmatic about the method of treatment in Wilms' tumors should consider each case individually with a view toward selecting that kind of therapy which appears most promising for a particular case Factors such as size of the tumor and apparent rate of growth are equally as important as the patient's general condition and the surgeon's skill and experience in handling this type of le-Regardless of the method of therapy to be employed, it remains the object of treatment to accomplish removal or complete destruction of the neoplasm before metastases occur static spread of the disease is a constant danger and cases are on record in which metastases developed during the course of a short clinical Once the tumor has metastasized, investigation the prognosis is hopeless, and no more than palliation can be expected from any form of therapy

We believe that immediate removal of the tumor, followed by postoperative irradiation, should be attempted in all patients with small, and apparently still encapsulated, Wilms' tu-Preoperative irradiation in such cases is of doubtful value, and delay of surgery may permit metastatic spread However, in patients with fairly large or apparently inoperable lesions, preoperative irradiation may reduce the size of the tumor to such an extent that it becomes operable In deciding whether or not preliminary irradiation should be employed, it must be kept in mind that a Wilms' tumor is usually found to be more extensive at the time of operation than was anticipated during the preoperative examina-If preoperative irradiation therapy is employed, no time should be lost in attempting surgery as soon as the neoplasm has regressed sufficiently to justify operation. The transperitoneal approach is preferable, because it offers not only better exposure, but it makes it possible to ligate the pedicle before the tumor is manipu-Postoperative irradiation should be employed in all these cases If, however, a tumor is found to be inoperable, it is not feasible to carry out partial removal of the growth. Such a procedure would not benefit the patient, but rather would invite disaster

It is in the group of inoperable tumors that radiation should be employed to the limit of tolerance. Treatment is given through 3 portals, using anterior, lateral, and posterior fields, starting with daily increments of 50 roentgens to each portal with a view toward increasing the daily dosage, if treatment is well tolerated. If possible, a total of 4,000 to 5,000 roentgens should be delivered into the center of the tumor, but the patient's general condition and possible ill effects from treatment may often necessitate a change in the plan of therapy with regard to daily increment or total dosage. Yet, in spite of all

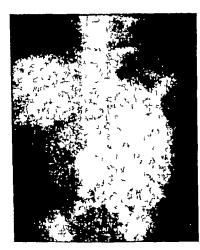

efforts, it must be understood that success or failure of radiation is only partially determined by dosage and technic employed. The immediate and remote results accomplished depend also upon the degree of radiosensitivity or radioresponsiveness of the tumor. Each Wilms' tumor presents individual variations in its response to irradiation. For instance, a tumor composed of immature cells can be expected to respond more satisfactorily to irradiation than a tumor consisting predominantly of adult-type cell elements.

Unfortunately, there is no way of predicting the degree of response which can be anticipated from the use of irradiation therapy in each case Only success or failure will supply the answer But the possibility that any Wilms' tumor might be radioresponsive or radiosensitive always justifies an attempt at irradiation therapy. By way of illustration, the following case will be reported briefly

Case 1—Baby P G, white girl, aged two, was admitted on August 31, 1937 At the age of ten months, the mother discovered a mass in the left upper abdomen, which increased rapidly in size One month later, hematuria and abdominal pain developed A transperitoneal exploratory operation revealed an inoperable Wilms' tumor Biopsy was made and the diagnosis confirmed Following the exploratory operation, the child received an undetermined amount of radiation therapy, which resulted in temporary improvement Later, on admission to the Institute, the patient presented a large nodular tumor which occupied almost the entire left abdomen Although ascites was present, no evidence of distant metasjases was demonstrable.

Treatment consisted of 200 kilovolt radiation, given through an anterior, posterior, and lateral field From August 31, 1937, to January 5, 1938, a total of 4,826 roentgens were delivered to the tumor by daily increments ranging from 50 to 131 roent-During the course of treatment, there was slow but steady improvement. The tumor regressed in size and two months after irradiation therapy, the ascites had disappeared. X-ray films of the abdomen revealed complete calcification of the tumor which continued to feel hard and nodular The patient gained weight and felt well, but in September, 1939, another course of irradiation treatment was given, since renewed activity of the tumor was suspected because of anorexia and From September 11, 1939, to October 27, 1939, 200 kilovolt radiation was employed, and a total of 1,445 roentgens were delivered to the tumor, using an anterior and a posterior field with daily increments of 94 roentgens

Ever since, the patient has remained in good health. She was examined last in January, 1947, at which time she felt well—Her general physique was that of a girl of her age (twelve years)—On palpation of the abdomen, there was still a hard, fixed, nodular tumor felt, which occupied a large part of the left upper abdomen—A flat film of the abdomen revealed no change in the size and shape of the calcified tumor, and a barium enema showed no displace-

Fra 3

ment or encroachment on the transverse or descending colon (Fig. 4)

This patient represents a ten-year cure, follow ing irradiation therapy alone. This proves that an attempt at radiation treatment may be well worth while in some cases of extensive but nonmetastatic Wilms' tumors. If metastases have occurred, irradiation treatment is of little value, because rapid development of new lessons is the rule, even while treatment is being directed against one metastatic tumor

Summary

Although Wilms' tumors comprise approximately 20 per cent of all malignant neoplasms in children, their occurrence is rather uncommon. Only 16 children with this type of tumor were admitted to the Roswell Park Memorial Institute during a thirty year period. This represents an incidence of only 1 case in about 3 500 admissions.

Pathogenesis, clinical course, symptoms, and diagnosis of the disease are discussed.

The prognosis of Wilms' tumors is poor with an ultimate mortality rate of close to 90 per cent. The dumtion of life averages less than one year after the diagnosis is made.

Removal or complete destruction of the tumor before development of metastases is imperative. No dogmatic rules should be followed in determining the method of treatment, but whatever form of therapy is best suited for each individual case should be selected.

Fig 4.

Immediate surgery followed by postoperative irradiation is advocated in small, movable tumors. Preoperative irradiation is advisable in fairly large or apparently inoperable lesions, thereby attempting to attain sufficient shrinkage to make the tumor operable. Removal of the tumor in such cases should be followed by supplementary postoperative irradiation. Inoperable Wilms' tumors should be treated by radiation alone Favorable results and even cures may be accomplished by irradiation in certam radiosensitive and radioresponance Wilms' tumors.

A ten-year cure of inoperable Wilms' tumor, following irradiation therapy exclusively, is reported.

ENDEMIC FEATURES OF RICKETTSIALPOX

Morris Greenberg, MD, New York City

(From the Bureau of Preventable Diseases, New York City Department of Health)

MOST of the rickettsial diseases are characterized clinically by the occurrence of fever, headache, and other acute symptoms, and, in addition the appearance of a rash which is macular, maculopapular, or petechial

During the summer of 1946, an epidemic occurred in a housing development in Queens, in which the clinical picture resembled the one described above. A rickettsial disease was suspected, although there were many differences from the known rickettsial diseases.

The illness of most of the patients began with a primary lesion, a papule which grew in size until it was 1/2 to 11/2 cm in diameter on an erythematous base, the center became vesiculated and then dried, forming a black crust which dropped off about two and a half to three weeks later, leaving a small scar Regional lymphadenopathy was usually found About a week after the beginning of the primary lesion, there was an abrupt onset of fever, chills or chilly sensations. sweats, headache, and backache, followed in one to four days by a rash over the body, sometimes sparse and sometimes profuse The rash was characteristically papulovesicular in character, the vesicles firm and surmounting the papules, later drying and falling off The acute symptoms and the rash lasted about a week each After the fall of the temperature the patients made a rapid There were no complications and no recovery deaths

Laboratory data were generally negative except for leukopenia during the acute stage of illness. Blood cultures were sterile, sedimentation rates were normal or slightly elevated, urine specimens were normal except for some albumin in the first days of illness, blood sugar, nonprotein nitrogen, chlorides, and cholesterol were within normal limits, and Wassermann tests were negative. Biopsies of skin lesions showed a vasculitis, similar to the finding in other nickettsial diseases.

In the epidemiologic investigation of the Queens outbreak it was shown that age, sex, and occupation were not important factors in explaining the cause or spread of the disease, nor were water, milk, or food supplies involved. Domestic animals were readily ruled out as reservoirs Ticks were not found either in the houses or in the neighborhood, and the only insects found, in some

of the basements and in an impoundment, were mosquitoes (Culex pipiens) The two constant features were the presence of mice in the apartments, storage rooms, and incinerators, and the presence of mites on the walls of incinerators, in stored objects such as boxes and couches, and as ectoparasites of the mice

The results of the investigation have been published in a series of papers $1-\delta$ It was shown that the disease to which the name rickettsialpox was given was an acute infection caused by a hitherto undescribed rickettsia, named Rickettsia akari This organism was recovered from the blood of 2 patients early in the disease, as well as from 6 pools of bloodsucking mites (Allodermanyssus sanguineus) found in the buildings where the outbreak occurred, and also from one of a number of mice (Mus musculus), trapped in the buildings Complement fixation tests, performed with serums from patients in the presence of rickettsialpox antigen (a strain of R. akari recovered from one of the patients), were negative early in the disease but became positive about the second week, the titer increasing during convalescence The reactions were specific, since such convalescent serums gave negative complement fixation reactions with antigens from a number of other viral and rickettsial diseases, the serums of normal individuals, as well as those of individuals with other diseases, gave negative reactions with rickettsialpox antigen An exception should be noted in the case of Rocky Mountain spotted fever, the sera of about 80 per cent of the cases gave positive complement fixation reactions with the antigen of Rocky Mountain spotted fever, but in lower dilutions

Another characteristic of the disease was the negative Weil-Felix reactions with convalescent serums. All the other rickettsial diseases in which a rash is one of the clinical features give a positive agglutination reaction with one of the antigens of Bacillus proteus. Epidemic and endemic typhus give positive reactions with OX 19, Rocky Mountain spotted fever and Boutonneuse fever with OX 19 and OX 2, and tsutsugamushi fever or scrub typhus with OX K, but convalescent serums from cases of rickettsial-pox did not agglutinate any of the B proteus fractions except occasionally in very low titers.

It is reasonable to believe that the cycle was somewhat as follows Mice thrived and multiplied in incinerators and other parts of the build-

Presented at the 141st Annual Meeting of the Medical Somety of the State of New York Buffalo Section on Public Health, Hygiene, and Sanitation, May 7, 1947

ings where there was food and warmth, they acted as animal reservoirs for infected mites which attached themselves to, and fed on the mice. The infected mites were accidentally introduced into human dwellings, probably by the mice, and obtained a blood meal from the humans when they were unable to get it from the animal reservoir Rickettsine were introduced into the humans either by the bite of the akarid or by the rubbing of his feces into the skin result, a primary lesion occurred at the site, and the clinical symptoms of rickettsialpox followed

At the beginning of the investigation in Queens the epidemic appeared to be sharply delimited to one small group of houses No cases occurred in the immediate vicinity, nor were any heard of in the rest of the borough. Soon, however, as physicians learned of the syndrome, reports of suspected cases began coming in from widely These were all scattered parts of the city investigated At present we have records of 54 definite cases, all unrelated to the Queens epi demic. They are spotted on the accompanying An examination of the map shows map (Fig 1) the wide distribution of cases in the city were found in four of the five boroughs often far removed from each other As a matter of fact the first cases that were seen in the city, aside from the Queens outbreak, were in a group in the northeastern part of the Bronx a distance of

Rickettsialpox spot map of New York City (Staten Island omitted)

about 25 miles from the region of the outbreak across the East River The physician who noti fied us had seen 10 cases over a period of a few years in one large apartment house and had heard of several more Since then, 2 more cases have occurred there On the map only 4 cases are indicated, since these were the only ones observed by us In addition to typical clinical symptoms, all 4 had a positive complement fixation test for nekettsialpox. In this house, as in the Queens houses, mice were abundant, and mites (Allodermanyssus sanguineus) were found in large numbers on incinerator walls. Mice were trapped in this house, and the blood serum of one of them gave a positive complement fixation reaction for rickettsialpox in a titer of 1 64

Although the cases are distributed over a wide territory, they tend, nevertheless, to group Manhattan, there are 5 groupings On the lower west side 6 cases occurred over an area of about 10 square blocks in the middle west section, 7 cases were seen in a similar area, on the lower east side, 5 cases were observed in an area of 6 square blocks, and an additional 3 cases can be added if the area is extended a little in the middle east section of the borough, 10 cases were investigated in an area of about 25 square blocks. with smaller groupings within the area, at the northern end of the island 2 cases were reported within a few blocks of each other

The groupings in the Bronx are also readily seen on the map In the northwestern part are 4 cases in 1 building, with probably 8 more in the same building, reported to, but not seen by us. This group has already been discussed. In the lower middle part of the borough 3 cases were seen in 1 building a probable fourth case was not seen by us during the illness and a blood specimen for complement fixation was refused case has, therefore, not been spotted on the map Three other groups of 2 cases each are readily observed 2 m the northern section of the borough and 1 in the lower western part.

Only 3 cases were reported in Brooklyn, and these were widely spread In Queens only 1 case was found in addition to the cases which occurred in the outbreak previously reported This case is in a part of the borough far removed from the site of the outbreak It is interesting to note that cases occurring in different houses had no relationship to each other except propinguity In some of the houses, however, multiple cases did occur in families This was quite marked in the Queens outbreak and has been discussed elsewhere, it was observed in three instances in Manhattan and the Bronx, where 2 cases occurred in 1 apartment in each instance.3

The diagnosis of the cases was basted chiefly as in the epidemic in Queens, on the typical clinical findings In about two thirds of the cases it was confirmed serologically by a positive complement fixation reaction for rickettsialpox with serums taken from patients during the convalescent stage A further serologic test showed the absence of agglutinins for B proteus OX 19, OX 2, and OX K in such serums. In some of the cases it was possible to obtain a specimen of blood in the acute stage and another during convalescence. The results in 13 such cases are shown in Table 1.

мт	Jan. 26 1947	Jan. 31 1947 Mar 12 1947	0 1 32

It will be noted that in 6 instances no complement fixing antibodies for rickettsialpox were present in the first specimen, taken during the first week of illness, but that significant titers had been achieved when the later specimens were taken In 1 instance (M C) a specimen obtained on the sixth day of illness already showed a titer In another case (W R.) a blood specimen obtained on the ninth day had a titer of 1 4 which rose in two weeks to 1 512 case (P R.) a specimen, taken twenty-eight days after onset, had a titer of 1 16 which rose to 1 32 a month later In still another case (I M) a blood specimen, obtained ten days after onset of symptoms, had a titer of 1 32 which had not changed twelve days later On the other hand, complement fixing antibodies for rickettsialpox were not present in C R in the first specimen, taken sixteen days after onset, but were found in serum taken two months later, and in L Z the complement fixation reaction was negative five weeks after onset, but was positive in a titer of 1 128 ten days later

Our data do not indicate how long high titers of complement fixing antibodies are maintained That the titers may decline after several months was indicated by D G, whose serum titer was 1 32 two months after onset of illness and dropped to 1 8 some three months later. In the Queens epidemic there was also a small number from whom a specimen was obtained several months after the illness, and here, too, a decline in titer of complement fixing antibodies was noted

It has been shown that blood obtained from mice in the Queens epidemic showed significant titers of complement fixing antibodies for rickettsialpox, although no such antibodies were found in laboratory mice nor in those trapped in Virginia ⁵ We have begun to trap mice in the houses where cases occurred in the other boroughs. To date, mice have been trapped in only 3 of these houses. In 2 of them significant titers of rickettsialpox complement fixing antibodies were found in the mice.

Comment

The occurrence of isolated and small groups of unrelated cases of rickettsialpox in widely scattered areas of the city indicates that the disease is endemic in New York City Epidemics like the one in Queens probably depend on a number of factors, among which are the presence of food and warmth on which mice can thrive, a sufficient number of infected mites, and a large group of susceptible humans Incinerators played a part in keeping the outbreak alive in Queens This was due to the fact that food was almost always present in them, so that mice were attracted to them and acted as animal reservoirs for the mites. found in large numbers on incinerator walls, and as ectoparasites on the mice The firing of the incinerators did not disturb either the mice or the mites unduly, since there were sufficient openings between the bricks lining the incinerators for the animals to escape into the wall spaces interesting to note that a similar situation existed in the Bronx where about a dozen cases were seen by a physician in 1 house A fair percentage of the other houses where cases occurred had incinerators

It should not be inferred that incinerators play a necessary role in the spread of the disease No incinerators were found in a number of the houses where cases existed The home in the lower Bronx where 3, and possibly 4, cases occurred was an old-fashioned tenement house without an elevator or an incinerator However, there were plenty of mice in the cellar, halls, and apartments There were also several uncovered garbage cans in front of the house which had apparently been there for a considerable time

There are many old-line tenement houses in New York City, and mouse harborages can be found in most of them Remnants of food are frequently seen in halls, cellars, and yards The collection of garbage is taken care of in one of several ways the tenant branes his pail down to the cellar and empties it into large cans, or the janitor goes through the house collecting the pails at each apartment, or the tenant sends his pail down to the cellar on a dumbwaiter method is used, garbage is spilled and becomes a good food source for mice. What often is not realized is that in modern houses which are kept fairly clean, mouse harborages may exist in incinerators which are not fired frequently and completely At any rate, in all houses where cases occurred, mice were plentiful In some instances. tenants had not seen any in their own apartments but had seen them in the cellar or halls, in others, mice had been seen repeatedly in the apartments

It is quite probable that the disease has existed in endemic form for some time in New York City Several physicians to whose attention the syn drome was brought recalled seeing several cases in the past few years which they were unable to diagnose, or which they called Brill's disease or atypical chickenpox, and which in retrospect appeared to be cases of nokettsalpox. Whether such cases exist in other parts of the state or country, we shall probably soon learn.

An epidemiologic method for discovering the extent of infestation in any community consists in making surveys of nice. They can be trapped alive in various sections of the community and their bloods examined for complement fixing antibodies for rickettsnalpox. At present this plan has been put in operation in New York City

To make a diagnosis of a case of rickettsialpox one should observe the clinical symptoms described, an initial lesion, followed in about a week by an acute onset with fever chills, headache and backnehe, and a papulovesicular rash. The blood specimen should be taken during antibodies of rickettsialpox and for agglutination with B proteus. Wherever possible, 2 specimens of blood should be taken, I early in the disease and I in convalescence. In this way a rising tuter may be demonstrated.

Control measures should be undertaken whereever the disease occurs, such as the scaling off of
harborages, possibly the trapping of mee, campaigns to keep garbage cans tightly covared and
to exercise care in the conveying of garbage from
the tenant a spartments so that none is spilled in
hallways and cellars. In houses where incinerators are used, care should be taken that they are
properly lined, that there is no accumulation of
food in the compartments, and that firing is complete and frequent. At present the public health
aspects of rickettsialpox are not serious enough
to require drastic measures. Should this occa-

sion arise, thought should be given to the development of a prophylactic vaccine and to the use of D.D T in the homes and on individuals exposed.

Summary

The clinical features and laboratory findings of rickettsialpox are discussed. An analysis is made of 54 endemic cases in New York City. It is pointed out that the cases were widespread in different sections of the city but tended, nevertheless, to group. A method of survey is indicated, and control measures are discussed.

Discussion

Philip J Rafle, M D, New York City—I am pleased to open the discussion of Dr Greenberg's presentation of Endemic "Rickstitailpox," because this new subject should be of interest to physicians

and health officer epidemiologists.

Occasionally we hear generalizations to the effect that communicable disease control is attaining a place of minor importance in public health practice Even though there has been appreciable control of some of the more common preventable diseases there are still unexplored and unexplained conditions obviously communicable to which the epidemiologic approach and new laboratory technics need to be applied. I have in mind the problem of the atypical pneumonias and diarrheal disease in the newborn it needs no emphasis that as the commoner conditions are brought under control we will have to direct our attention to these not well-defined or well-understood diseases. These are largely in the field of diseases transmitted from animals to man. Communicable disease control is and will continue to be fundamental and basic in organized public health practice Therefore; it is gratifying to have evidence of such epidemiologic approach to an entity such as rickettsialpox presented to us in support of this belief

Rickettaial disease is not a rarity in New York State. Endemic typhus or Brills disease has been described and reported in New York City There is some question as to its origin, and it is believed that the disease, as manifested in New York City was an exacerbation of old world typhus. This is based to some extent on the observation that the individuals so affected were Central Europeans and had acquired their primary disease prior to emigrating to the United States.

Since 1913, Rocky Mountain spotted fever has been recognized as endemic in eastern Long Island. There has been slow progress in its spread westward on Long Island, but last summer a case, indigenous to Brooklyn, was recognized in Brooklyn. The dog tick, Dermacentor variabilis has been involved in this ricketitaid disease. There is ovidence that dogs in the endemic area have a high titer of complement fixing antibodies against Rocky Mountain spotted fever ricketitaid antigen. To the practitioners of medicine in southeastern Suffolk County Rocky Mountain spotted fever presents no particular difficulty in its diagnosis, but in other areas in which to cours infrequently the disease is often confused.

with other conditions presenting "rashes" As pointed out by Dr Greenberg, the Weil-Felix reaction with certain strains of B proteus are negative early in the disease but increase in titer in the second week. The Weil-Felix reaction offers a means of differential diagnosis from rickettsialpox.

During the coming spring and summer season the State Laboratory will perform the highly specific complement fixation test on positive agglutinations by Weil-Felix reactions, thus making available to us an additional aid for clinical differentiation. It is strange that in the face of the fact that Rocky Mountain spotted fever has been observed on Cape Cod and the Atlantic coast south of Long Island, it has not originated, as far as we know, on the mainland of New York. Ticks capable of transmitting the disease are present, at least to my knowledge, in Westchester County

This brings to point that often we have seen eruptive fevers that are puzzling On the basis of our knowledge of the exanthemas, I feel we have been inclined to describe them as atypical of the disease it most closely resembles Rickettsialpox was considered by some as atypical chicken pox I am sure that we have had similar experiences in classifying the unknown as atypical this or that these missed diagnoses come back to haunt us, as for example, smallpox I believe that it was Dr E S Godfrey who stated that the essential prerequisite for an epidemiologist is that he must possess more than a modicum of skepticism I feel that, perhaps when we approach these apparent atypical manifestations, we should be more skeptical of the conclusion, we should approach the problem epidemiologically, and we should utilize the newer technologies developed in the laboratory I think we will be rewarded by disclosure of conditions expected to occur in the tropics or other remote places rather than in New York City

F R. Weedon, M D, Jamestown—It is a rare privilege to witness the discovery of a new disease It is a gratifying thing to observe the smooth pattern of efficiency with which many groups of specialists, private physicians, and government experts have worked systematically to solve an intricate problem which presents so little primary data for study

A large number of people have worked on this situation private practitioners, health officers, epidemiologists, immunologists, pathologists, entomologists, bacteriologists, virologists, and many others

The difficulty of recognizing man's enemies appears to increase with the decrease in size of those enemies. Any cave man knew enough to stay away from the head end of a woolly rhinoceros, but we need a physician and a bacteriologist to avoid the small bacillus properly.

Rickettsial diseases have followed the curve A further step down in size has resulted in a large increase in man's expert body guards. It seems to me that this is logical and must be accepted

If you agree with me in this generalization, you may accept the probability that laboratory procedures will also become more intricate in study of the rickettsial diseases Of his early cases Dr Green-

berg says that laboratory data were generally negative except for the complement fixation reaction

The complement fixation test is, we believe, the most practical diagnostic laboratory procedure available in study of rickettsial disease, and our experience with typhus fever has convinced us that the quantitative complement fixation test of Wadsworth, Maltaner, and Maltaner is by far the most promising technic of this test. It is more elaborate, to be sure, but it is so much more precise and at the same time so much more flexible that we feel that, in the intricate work of diagnosis of rickettsial disease, this form of the test is of the greatest value

Florence M Varley—Titration of the antibody content of serum, as measured by the complement fixation test developed by Wadsworth, Maltaner, and Maltaner, is based upon the point of 50 per cent hemolysis of the sheep cells used as indicator. The amount of complement which will hemolyze half the cells can be figured from any degree of partial hemolysis obtained, because after proper adjustment of reagents an S curve results from varying amounts of complement.

This means that with constant amounts of antigen and antibody the amount of complement which will hemolyze 50 per cent of the cells bears a constant relationship to the amount that yields 40 per cent, or 60 per cent, or any given degree of partial hemolysis

In our work with typhus fever, as well as in past work with syphilis, the need for refinement of the antigen was demonstrated. With crude extracts the relationships do not hold, the S curve cannot be obtained, and results are not reproducible. Fluctuating results also occur if the amounts of antigen used are not titrated with antiserum to yield maximal fixation of complement. This preliminary work must be done carefully.

In the work with typhus, all this was followed through We found our relationships and were able to reproduce results Nevertheless, different series of antigen gave very different titers with the same antiserum, while all evidence that this might be due to strain variation was lacking. Even the difference between epidemic and endemic typhus tended to disappear

It might be that further study of rickettsialpox with more strains and different preparations of antigens will reveal either a closer relationship to Rocky Mountain spotted fever or even greater differences between the 2 diseases antigenically

We believe that the quantitative complement fixation test is the most practical and most promising of all the laboratory tests for the study of the complicated field of virus and rickettsial diseases which we seem to be entering

COUNTY TUBERCULOSIS HOSPITALS

ROBERT E PLUNKETT, M D Albany New York

(From the Tuberculosis Control Division New York State Department of Health)

IN discussing county tuberculosis hospitals, a program limited by the 4 walls of a hospital build ing and concerned only with the medical care of patients may be presented. In New York State, however, a presentation of this sort would fall far short of a true portrayal of the actual services of the county hospital and its contributions to the tuberculosis control program.

For more than three decades the superinten dents of many of the county hospitals have pioneered in the development of services which not only have emphasized in the minds of the people the importance of the county tuberculous hospitals, but also have enhanced the community's contribution to tuberculous control If the benefits realized from these services had been limited specifically to tuberculous, the funds expended and the work performed would have been more than justified, but throughout the years other aspects of both personal and public health have been favorably influenced Medical practice, in general, has been favorably influenced, either directly or indirectly, by the services of the county tuberculosis hospitals. Such services embrace the participation of the superintendents in county and state medical society programs including graduate education, the chest consultation service available in many counties and not limited to tuberculous diagnosis and the devel opment of a reciprocal service between the practicing physicians and the county sanatorium The development and growth of public health nursing is in part built upon the foundation laid by the tuberculous nursing service From the viewpoint of health education, it is impossible to estimate how far-reaching has been the influence of the hospital and clinic service of the county

From the viewpoint of the public, the buildings and service of a tuberculous hospital are symbols of disease prevention and health conservation. The public has come to realize to an appreciable degree that one of the main purposes of a tuberculosis hospital is to segregate a person with a contagious disease. This awareness of the man on the street that certain diseases are "catching" cannot help but influence personal hygiene favor ably The health teaching, too, as informal as it may be at many cheat clinics, deserves mention

hospitala.

One measure of stewardship is the death rate from this disease. In 1009, when counties first were given authority to establish tuberculosis hospitals, the tuberculosis death rate for upstate New York was 145 7 per 100 000 population. In 1946, the provisional resident rate was 30.2 This represents a decline of about 79 per cent. In spite of this decline, the fact that more than one-half of the deaths occur during the most productive years of life presents a serious challenge.

Consideration also must be given to the influ ence of improved health on our social and economic structure Obviously, the cost to society of tuberculous with all of its intangible by prod ucts, cannot actually be measured by any known vardstick. Although the tuberculosis hospital is a major factor in contributing to the improvement in health by preventing tuberculosis, its service favorably influences other health problems. In the field of scientific progress, medicine including that concerned with chest diseases, has assumed a conspicuous place Physicians, including chest specialists, have been provided with scientific tools which have made it possible for them to replace empiricism and passive methods of expectancy in the treatment of tuberculosis with the application of scientifically known preventive diagnostic, and therapeutic measures.

New and promising horsons have been opened in the field of public or community health. The masses of people are better informed on matters of health conservation. Public opinion has assumed a more positive character about community needs for the prevention of disease. More and more people not only recognize these needs, but also actively promote and support public officials in improving environmental sanitation and other public health services. New discoveries and advances in chemistry, bacteriology immunology, epidemiology, and pathology, together with progress in the social sciences and an encouraging renaissance in the practice of the art of medicine, complete this mosaic of prevention and cure.

Since public health is but the composite of personal health, it is essential, if progress is to be realized that we integrate more completely the practice of medicine with the administration of public health. The tuberculous hospital in this state has shown the way, and it is apparent in this specialized field that there is a constantly growing, better understanding between the private practitioner of medicine and the practitioners of public health.

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on Public Health, Hygiens, and Sanitation, May 5, 1947

In the organization of a tumor clinic one of the first requirements is that there be an earnest desire on the part of the hospital staff to conduct a clinic. In addition, such a project cannot be successful unless it receives the full support of the entire staff. The members of the tumor clinic staff should consist of a surgeon, internist, radiologist, and pathologist. Members of the other specialties, as well as the entire staff membership, can and should participate in the tumor clinic conference. Every member of the staff should consider himself an integral part of the tumor clinic, because everyone has something to contribute.

The clinic should be conducted in a hospital because of the facilities available for diagnosis and A room of the hospital, equipped so that the examiner can do a complete physical examination, is necessary Facilities for biopsies, blood tests, and blood counts should be provided There also should be a waiting room, a hall can be utilized for this purpose Some clinics require that all patients be referred by physicians, while others allow patients to come to the clinic and send a report of the findings to the physician of the patient's choice The referring physician always remains in control of the patient, the advice of the clinic can be accepted or rejected as the referring physician deems wise The services of a nurse and secretary also are required in a tumor The nurse can aid in the preparation of the patient for physical examination as well as in performing biopsies and other required nursing The secretary can make and keep the records, make appointments, transcribe follow-up notes, prepare and send reports to the referring physicians, and perform all secretarial duties pertaining to the clinic

Histories and physical examinations can be obtained by a resident of the hospital or one of the younger physicians practicing in the com-The time of the tumor clinic group, munity usually composed of busy practitioners, should not be occupied by routine physical examinations and history taking Such duties can be performed the day before or just prior to the confer-The salient points can be enumerated to the clinic group, but the group should examine the patient and each give his opinion as to diagnosis and the treatment indicated If the diagnosis is not readily apparent, it is the responsibility of the tumor clinic staff to suggest and order those diagnostic procedures which will permit a positive The patient who has been treated should return to the clinic for follow-up observa-This is as important as is the initial diagnosis and treatment It is a safeguard for the patient and also allows the physician an opportunity to evaluate the type of treatment which was given

It is thought by some that a tumor clinic is only for indigent patients. That is erroneous. The clinic renders a consultation service to the physician and the patient whether the patient is indigent or otherwise. Some clinics require a fee for the services rendered, whereas most extend this service to the patient without charge, considering it a service of the staff and hospital. Added diagnostic procedures sometimes required to make a diagnosis are borne by the hospital, welfare organization, or the patient. Thus, local control of administration of the individual clinic is maintained, and problems are solved in accordance with existing local conditions.

There is no definite rule as to the hours for the clinic conference, but it should be given serious consideration. The time of the meeting should be that which will enable the largest number of physicians to attend. The number of meetings per week or month will depend entirely on the case load. Some of the large clinics meet 4 times a week, smaller ones twice a month. In many clinics the schedule of cases is posted on the bulletin board for the information of the staff and as a reminder of the meeting.

The minimum standards for approval, enumerated before, must be adhered to before approval can be given This is not as difficult as it would Most of the hospitals possess the necessary personnel to organize a tumor clinic is an urgent need for competent pathologists in New York State, but some communities have solved this problem by having one pathologist service an entire county The county health laboratory and its pathologic service have many advantages The pathologist, too, can benefit by such consul-At times it would be the means of rendtation ering a more accurate diagnosis When more pathologists can be procured, every hospital or community should attempt to obtain such service The personnel of a clinic, perhaps with the exception of the pathologist, is available in most hos-It is merely a matter of organization and bringing the staff members together to form While "clinic" is a word that numerous physicians have come to fear and dislike, the tumor clinic can aid the physician and the hospital by rendering the cancer patient better facilities for diagnosis and treatment

The purpose of the cancer clinic is to insure better care for cancer patients. Cancer is believed by some to be the nation's foremost public health problem. The incidence of cancer is increasing, and every community should be prepared to render adequate service to these patients, not only to the patient with early disease, but also to those with advanced cases. There are always a certain number of the latter who do not receive adequate care. Such care can be provided in the home, hospital, or nursing home.

The tumor clinic will provide consultation by those well versed in the various methods of diagnosis and treatment. In the beginning, per haps, a consultant, qualified in the diagnosis and treatment of cancer, can be brought to the clinic. However, this arrangement can be a detriment as well as an aid to a tumor clinic Patients from the community in which the tumor clinic is conducted may ignore the local facilities and go to the consultant soffice or hospital for ding nosis and treatment. This has actually occurred and caused friction between the staff of the tumor clinic and the consultant As a rule after a consultant has regularly attended a clime for two or three years such service is no longer necessary If his services are still required the consultant is not a good teacher or the staff members are reluctant to become interested and assume their rightful responsibility

The staff of the tumor clinic will constitute a definite organization of members selected for their ability in the various specialties of medicine and will provide a continuity of service for the cancer patient. This will serve as a means of providing postgraduate facilities in the study of cancer to the members of the staff. The diag nosis made by the tumor clinic group will be more accurate because in most instances it will be based on pathologic findings. Then too the given condition can be discussed freely from a pathologic surgical and radiologic point of view with an evaluation of the ment of various types of therapy at the disposal of the members of the clinic

Follow up of the patient is very important is generally conceded that the clinic patient has better follow-up than does the private patient The reasons for this are obvious to all of us who have practiced private medicine The follow-up service can be provided in the tumor clinic by a staff familiar with the cancer problem follow-up examination should not be a cursory one, rather the tumor clime group should be prepared to seek and recognize metastatic foci at sites of predilection This could be accomplished not only by physical examination but also by diagnostic x ray and laboratory tests Often these facilities are not available in a physician s office, and if the physician was not interested and cognizant of the behavior of the various types of malignancy with which he is confronted he might fail to recognize the extension of the cancer to organs nearby or to those more distant

In the chaic a planned program for therapy could be carried out and the various methods of therapy could be properly evaluated. This could take the form of clinical research including a record of the types of manganancies seen at the clinic and how these responded to therapy. Fur

thermore, the clinic staff would have the opportunity of noting whether the patients are suffering from late or early disease. This could have a direct bearing on the educational program which was necessary for the given community

To be more specific, the tumor clinic is benefi cial to the patient physician and hospital tients, as a rule, refrain from leaving their own com munity for medical services, but many hospitals and physicians force patients to go elsewhere because of lack of facilities, fashion, and personal prejudices The tumor clinic will provide adequate facilities for diagnosis and treatment, and if, in the given clinic, the facilities are not adequate, these can always be supplemented The average patient has a great deal of confidence in his personal physician. his visits are awaited with a great deal of anticipation his advice is always engerly sought when cancer is encountered the patient is receiving care in his own community, that patient-physician relationship is not disturbed However if the patient is sent to another community for treatment, it is impaired The family physician can aid the specialist in the care of the patient by assuming some of the responsibility and by reassuring the patient about the treatment which is being given. The patient receiving follow-up treatment and observation is more apt to keep the appointments, due to the proximity of the clinic This will be more condu cive to the immediate detection of metastases or recurrences and more effective palliative treatment will be afforded the patient all of which will result in longer life and a longer period of useful economic activity

Through the tumor clinic the physician can aid in the diagnosis and outlining of treatment for the patient and observe and care for him while treatment is being given. The patient remains under his direct supervision and control. It also affords the physician an opportunity to participate in postgraduate cancer education by observing groups of cancer patients at the tumor clinic Better records are kept by the physician concern mighis cancer patients. Clinical research will be correlated with laboratory research. By pooling the knowledge of the tumor clinic group, more accurate diagnosis and better therapy will be instituted.

Once a tumor clime has been established in a hospital, that hospital is reluctant to discontinue this activity. It completes the service rendered by the hospital to the community. The clinic will be the means of increasing the number of hospital days, it will be directly responsible for in creased case load in the x-ray diagnostic x ray therapeutic, surgical, and laboratory departments. It may seem as a casual observation, that the tumor clinic is a liability, but upon close

scrutiny and evaluation of all of its advantages to the patient, the physician, and the hospital it is seen to be a definite asset

The tumor clinic program in the State of New York has become more effective, since the staff members of the respective tumor clinics have organized the Tumor Clinic Association of New York State Regular meetings and clinics are held to aid in the conduct and operation of the clinics in rural communities as well as in the large Such collaboration and exchange of hospitals ideas has improved the tumor clinic service. This organization is interested in every type of problem confronting tumor clinics and has done much toward formulating policies to govern the conduct and activity of these clinics

Aid in the operation of the tumor clinic can come from many sources Some hospitals have assumed full responsibility for the clinic, even going so far as to assume the entire cost of diagnosis and treatment of the indigent patient when the payment for these services cannot be obtained from other sources The Department of Welfare will aid in defraying the expense incurred by the The private patient indigent cancer patient will pay for tumor clinic service, since he expects to pay for this service as he does for any other hospital service The remuneration obtained from patients may not be sufficient to defray all expenses The New York State Department of Health through the Division of Cancer Control will furnish secretarial aid to a clinic This is a part-time position and the work of the clinic is performed outside of regular duties secretary will receive 40 cents an hour and will be limited to forty-eight hours a month proved sufficient for most clinics Funds for other secretarial service for special projects are also available

Clinical aid for the medical preparation of patients for presentation at the tumor clinic can also be arranged This is usually granted to a resident or to a young physician who is interested in The physician for this service the tumor clinic is chosen by the staff and is under the jurisdiction of the tumor clinic staff The compensation paid for these services is \$10 per clinic session

The federal government has allotted New York State a sum of \$219,000 for cancer control These funds can be used for radium for loan to tumor clinics and also for the payment of consultants for tumor clinics The fee has been placed at \$50 per day plus traveling expenses Provisions have been made for clinical and nursing aid in cancer detection clinics and also for one to three months postgraduate training for physicians in various phases of the cancer problem

The American Cancer Society through the New York State Division also grants funds to aid

T.

tumor clinics in New York State To date. projects totalling \$248,791 88 have been financed by this organization to various hospitals through-These funds can be used either for out the state a service or an educational program Funds have been granted for the purchase of diagnostic and therapeutic equipment, as well as for the purpose of providing physicians an opportunity for postgraduate study at other recognized clinics A study is also being made of the cost of caring for advanced cancer patients This is a costly procedure and only limited funds can be supplied for this purpose, but it is being tried out as an expen-

Any tumor clinic which is desirous of receiving funds from the American Cancer Society must have the project approved by the Cancer Committee of the local county medical society request is then submitted to the office of the American Cancer Society, New York State Division, Inc., Terminal Building, Rochester, New The nature of the project will determine its referral to the service or the educational com-After careful study by either of these committees, it is approved or disapproved as the ments of the project indicate. If it is disapproved, the reasons are given, and when the project is returned, recommendations are made concerning the faults of the project. On the other hand, if it is approved, it is presented to the executive committee which confirms the project, and the money is granted This procedure does not consume much time, but all these projects must be studied carefully and granted through their own merits, since this money was contributed by the people of the State of New York voluntarily for the control of cancer All of this money must be put to the use of the cancer patient, our chief concern

The Roswell Park Memorial Institute, which is the New York State Cancer Hospital, has an important role in the tumor clinic program of the At its last meeting the Tumor Clinic Association designated the Institute as the "mother clime" The staff of the Institute has accepted this responsibility

There is need for a state cancer hospital and also for the tumor clinics The Institute should be and is prepared to care for patients who cannot receive care at the local tumor clinic cancer patients cannot be treated at the local clinic, but the local clinic should have some institution where necessary diagnosis and treatment are available to which the patient can be referred Forty-five per cent of the patients referred to the Institute have benign disease These should all be diagnosed and treated in the community in which these patients reside This would relieve the case load of the Institute and allow more

time for the cancer patient Physicians should know their limitations, if a cancer patient cannot be treated at a given clinic, the patient should be referred to the Institute or some other clinic where suitable treatment can be given staff members of some clinics are unable to per form difficult and prolonged surgery required for the complete removal of cancer of the mouth. esophagus, atomach, chest, larynx, bowel, etc At times these patients are not afforded the opportunity of this surgical treatment, because it cannot be obtained at the local clinic Institute is able to furnish this service, and that is one of its important roles. If a patient upon laparotomy, is found to have a malignancy beyoud the skill of the operator that patient should be sent to the Institute or elsewhere in order that the patient may be given the advantage of a more experienced or skillful surgeon The same applies to radiation. The application of radiation is an exacting science. Therapeutic v ray is a potent therapeutic agent, its use must not only be understood but properly applied \(\strace{1}{3} \) ray therapy at times has come into disrepute because of improper application. A 200 kilovolt machine will not be suitable for all types of malignancies The x ray therapeutist should not only recognize his own limitations but also the limitations of his x ray machine. The 200 kilovolt machine has a rightful place in the therapeutic armamentarium but alone it is not entirely sufficient. Many pa tients require treatment with higher voltages in order to apply homogeneous radiation to the cancer If the higher voltages are indicated and not available, that patient should be sent to a clinic where such treatment is available. The same holds true for radium therapy In order to have a successful tumor clinic program in New York State the Institute must work with the tumor climes prepared to supplement services which cannot be obtained in the local clinics The Institute, through its reorganisation and aug mented program, is able and ready to give these services. Lack of beds at the Institute is hinder ing our program at present, but it is hoped that in the future a new hospital will afford more beds for cancer patients.

The responsibility of offering treatment to approximately 37 000 cancer patients in upstate New York is the responsibility of the Medical Society of the State of New York, the Tumor Clinic Association, the New York State Department of Health and the American Cancer Society, New York State Division

Summary

1 The minimum standards for tumor clinics as adopted by the American College of Surgeons are commercted

- 2 There are 407 fully approved tumor clinics in the United States
- 3 New York State, exclusive of New York City, has 41 tumor clinics, 34 of which are approved
- 4 A definite distinction exists between a tumor clinic and a detection or preventive clinic
- 5 The organization operation, and purpose of a tumor clinic are discussed
- 6 The benefits of such a clime to the physician, to the hospital, and to the patient are enumerated
- 7 The program of the Tumor Clinic Association is integrated with that of the Roswell Park Memorial Institute
- 8 Tumor clinics and physicians have limitations regarding the diagnosis and treatment of cancer patients. These must be recognized

633 NORTH OAK STREET

Discussion

Archibald S. Dean, M.D., Buffalo —Dr. Kress has presented a comprobensive and dynamic summary of the status of tumor clinics in New York State. The medical profession has made remarkable progress ance 1930 in the development of tumor clinics, but the high incidence of cancer calls for greater utilization of such facilities.

Public health administrators are becoming increasingly concerned with the control of cancer. The development of county health departments and of the health services of large cities with State aid will provide more administrative and public health nursing personnel to assist in the campaign for the early diagnosis and adequate treatment of malignancies.

The minimum standards of the American College of Surgeons for tumor clinics as given by Dr Kress, state that a social worker shall be available for the purposes of the clinic and that patients shall receive periodic examination for a period of at least five years following treatment

Social workers in the Buffalo region are not generally available for home calls outside the munici palities in which the tumor clinics are located Public health nurses however serve the rural as well as the urban area. Tumor clinic patients who fail to return for the completion of diagnosis or therapy after letters have been sent to them should be referred to public health organizations for visitation by public health nurses. The nurse sometimes finds that the patient is too ill to get to the clinic Various hindrances to clinic attendance may be met and solved by the public health nurse who makes the home visit. Dressings and other care and instruction when necessary can be given to the cancer patient at home when there are sufficient public health or visiting nurses

When other measures for porsuading tumor cluic patients to return for periodic examination following treatment, have been exhausted, public health nurses in localities adequately supplied with per sonnel may assist by usiting the patient in his home The extent of such service will depend upon the wishes of the tumor clinic staff and the comprehensiveness of the local public health organization Dr Holla, Westchester County Commissioner of Health, has informed me that his county public health nurses make many home calls to tumor clinic patients before and after treatment

The State district and local health services which maintain rosters of reported cancer patients receive monthly from the State Division of Cancer Control a list of persons who have died of cancer Each tumor clinic may receive each month from the district or full-time local health officer a list of the deaths of persons who were reported as cancer patients by the tumor clinic The report to the tumor clinic includes the name and address of the person, the date of death and the primary and secondary causes of death by code numbers The tumor clinic physicians appreciate this service from health officers

Kress has differentiated between tumor clinics and the so-called cancer prevention or cancer detection clinics to which persons without symptoms of neoplastic disease may go periodically for examination The primary objective of the cancer detection center is to detect sooner than would otherwise be discovered, early cancer, precancerous lesions, or areas of chronic irritation which may be followed by cancer

The American Cancer Society stated in March that whereas only 15 cancer detection centers were reported in operation in the United States last year, there are now 118 The American Medical Association has approved of the cancer detection center standards of the American Cancer Society, while the American College of Surgeons has announced plans for a nationwide survey and approval of cancer de-The Maryland State Department tection centers of Health and the Maryland Division of the American Cancer Society, jointly, with the cooperation of medical societies and local health departments have recently established cancer prevention centers

Health officers generally are convinced that x-raying the chests of all supposedly well adults is an effective way of discovering tuberculosis early cidentally, the x-raying with 70-mm film of the chests of 85,000 persons by the Buffalo and Erre County Tuberculosis Association during the past year disclosed that 42 persons-or 1 among each 2,000 x-rayed—had suspected neoplasm in the chest

Public health officials may well cooperate with the rest of the medical profession in supporting tumor diagnostic and treatment clinics and in evolving various acceptable plans for lessening the time interval between the development and the discovery of cancer

Morton L Levin, M.D., Albany — The tumor clinic as a means of improving community facilities

for meeting the clinical problems of cancer has, from its inception, had the firm support of the American Medical Association, the American College of Surgeons, and the Medical Society of the State of New York Since the tumor clinic is a specialized form of group practice, cancer is the first major disease recognized by the profession as requiring some form of group practice to secure the fullest application of medical science Under the leadership of James Ewing in 1939, the New York State Legislative Cancer Commission recommended the establishment of more tumor clinics in this state as the preferable alternative to the creation of specialized cancer hospitals Thus, as a test of the soundness of that recommendation, the tumor clinic has been, and still is, on trial as a method of meeting the needs of cancer patients

At present approximately 15 per cent of new cancer patients are referred to tumor clinics in the upstate area How well each clinic meets the demands upon it depends on the quality and training of its staff and the support which it receives from the other physicians of its hospital and community These factors vary considerably It should be noted, however, that regardless of its initial value, the tumor clinic acts as a constant educational experience for its staff and for those physicians who attend its meetings Thus, their proficiency in meeting the special problems of cancer patients increases faster than if they relied solely on their own practices for such experience In some instances the teaching value of the clinic is increased by the regular attendance of a consultant, usually a graduate fellow of a recognized cancer center Although not many such consultants are now available in the upstate area, in the next few years their number will probably increase

There is little doubt that a well-organized, properly staffed, and fully supported tumor clinic is a medical facility valuable to the hospital and the community Whether tumor clinics alone can meet the full demands of the general practitioner for consultation and assistance in providing the most modern technics of diagnosis and therapy for malignant tumors remains to be seen One of the factors which will influence the result is the extent to which tumor clinics receive the full support of the practitioners of the community

PENICILLIN IN GONORRHEA

Experiences with Various Preparations and Technics

Adolph Jacoby, M D , Arthur Ollswang, M D $\,$ Jules Freund, M D $\,$ and Theodore Rosenthal, M D , New York City

(From the Social Hygiene Clinics Department of Health and Public Health Research Instituts of the City of New York Inc.)

THE pencillm therapy of generatea, in the period when penicilin was a restricted commodity, was limited originally to patients restrant to sulfonamide treatment ¹ A varying number of injections of pencillin dissolved in water, were given every two or three hours. This particular treatment required hospitalization of the patient according to our knowledge at the

A practical ambulatory method of treatment was introduced in the venereal disease chines of the New York City Health Department in August, 1944 using an aqueous solution of penicil lin administered by intramuscular injection every two hours for three injections. Our ambulatory methods of treatment date from this time

Type of Patients—The ages of patients ranged from eleven to sixty years—They were of many nationalities and of both sexes—All stages of genoeoccic infections from acute to chronic were included and treated by the same technic

Diagnosis—The diagnosis was based on the positive bacteriologic findings in smear and culture of the discharges. The culture medium employed in our laboratory is that devised by Peiser.

A serologic test for syphilis was performed on all patients on admission. Where the test was negative, it was repeated every month for three months. We have encountered no instance of a masked syphilitic infection in a patient treated for gonorrhea with penicillin.

Criteria of Cure—No patient was considered cured for purposes of this study until clinical symptoms had disappeared and until three suc cessive smears and cultures, taken at weekly intervals from the urethra and prostate in the men patients and from the urethra and cervix in the women patients were negative Patients who were not observed long enough to meet these criteria were eliminated from the final evaluation of this form of therapy

Treatment

In the evolution of penicillin therapies a single injection method, using first a water-in-oil emul

Presented at the 141st An ual Meeting of the Medical Boelety of the State of New York Buffalo Section on Public Health Hygiene and Sanit tion May 7, 1947

sion and, subsequently an oily mixture, was employed originally Later, several preparations of penicilin administered orally were used Our experience with these different preparations and methods is herewith detailed (Table 1)

TABLE 1 -PENICULIN IN GONORRHUA

	Dosage	Number Treated		Per Cent Cured	
Type and Method	Units	Men	И ошев	Men	Women
Aqueous solution					
3 doses	100 000	396	58	87	83
3 doses	150,000	075	178	86	88

Plain	400 000	13	0	46	_0
Alum-Buffered	400 000	92	8	88	75
Lipoid-Buffered	400 000	46	G	76	100

Pencillin in Water—The first practical ambulatory method for treating patients with gonorrhea consisted of dissolving the required dosage of penicillin in 6 cc of water and injecting 2 cc of this solution intramuscularly in the gluteal region every two hours for 3 doses

Five hundred four patients were treated using 100 000 units of penicillin in water in 3 divided doses Of these, only 454 patients consisting of 306 men and 58 women could be followed and observed, 87 per cent of the men and 83 per cent of the women were cured

One thousand eighty-eight patients were treated using 150,000 units of penicillin in 3 divided doses. Of these, 853, comprising 675 men and 178 women were observed for the proper study period 86 per cent of the men and 88 per cent of the women were cured

One hundred seventeen cases were treated with 150 000 units of penicilin dissolved in 2 cc of water and injected intramuscularly in a single does. There were 101 men and 16 women. Seventy-one per cent of the men and 75 per cent of the women were cured.

Pencillin Envisions — The material was prepared by dissolving the required dose of pencillin in 14 ec. of water and emulsifying the solution in 31 ec of a mixture of 11 parts falba and 20 parts of peanut oil The total amount, 45 ec., was injected intramuscularly in the gluteal region. This method was first used in August 1945.

The doses of penicillin used and the results were as follows

- 1 Penicillin water-in-oil emulsion—150,000 units 2,986 patients were treated with this preparation. It was possible to follow 2,160 cases, 1,649 men and 511 women. Seventy-eight per cent of the men and 86 per cent of the women were cured.
- 2 Penicilin water-in-oil emulsion—200,000 units 2,467 patients were treated with this preparation, and 1,810 were followed for a sufficient period. There were 1,326 men and 484 women, 80 per cent of the men and 87 per cent of the women were cured.

Pencellin Oil Mixture — This preparation consisted of very finely ground pencellin thoroughly dispersed in a mixture of 11 parts falba and 20 parts of peanut oil. The treatment consisted of 1 intramuscular injection of the entire dose of pencellin in 1 cc of falba peanut oil mixture. The use of this preparation was begun in June, 1946.

- 1 Penicilin oil mixture—150,000 units 7,151 patients were treated with this dosage, and 4,409 of these were observed for a sufficient length of time for definite conclusions There were 3,517 men and 892 women, 65 per cent of the men and 84 per cent of the women were cured
- 2 Penicillin oil mixture—300,000 units 278 patients were treated with this dose, of whom 188 were observed for the proper study period. There were 155 men and 33 women, 93 per cent of the men and 97 per cent of the women were cured.

Oral Pencillin—Three preparations were evaluated The first was an alum-precipitated pencillin buffered with 0 3 Gm sodium benzoate The second was crystalline potassium pencillin G buffered with glycerides and sodium salts of fatty acids * The third was crystalline potassium pencillin G unbuffered * It was found that a minimum of 400,000 units, given in 4 divided doses every three hours, was required for oral use

Thirteen patients were treated with unbuffered crystalline potassium penicilin. Seven of these failed, and further use was discontinued

One hundred cases were treated with alum precipitated tablets There were 92 men and 8 women, 88 per cent of the men and 75 per cent of the women were cured

Fifty-two cases were treated with tablets of crystalline potassium penicillin G buffered with glycerides and sodium salts of fatty acids. There were 46 men and 6 women, 76 per cent of the men and 100 per cent of the women were cured.

Discussion

Patients who failed to be cured by any of the above methods of treatment were re-treated with the same preparation using double the dosage for the second course Re-treatment was, in some instances, necessary 3 or more times Failure of treatment was noted if the smears and cultures were postive within one week after treatment. Thus far we have failed to encounter any penicil-lin-resistant infections. The majority of the patients who failed to stay under observation for the required number of laboratory examinations were, in all likelihood, cured, since many of them had one or two post-treatment negative smears and cultures before being lost from observation.

Our first ambulatory treatment using 3 injections of penicillin aqueous solution every two hours resulted in from 83 to 88 per cent cures. Our next preparation, water-in-oil emulsion, gave practically a similar range of cures. However, an aqueous solution of penicillin, injected as a single dose, gave considerably fewer cures, 71 to 75 per cent. It is, therefore, evident that retardation of absorbtion by oil mixtures or repeated injections of water solutions give similar therapeutic results. The single injection of a preparation of penicillin in a retarding vehicle is a more practical ambulatory method.

Our first dosage level with water-in-oil emulsions was 150,000 units. This gave us from 78 to 86 per cent cures. Thinking that an increased dosage would increase the percentage of cures, we used 200,000 units. Our cure rate, however, was practically the same, between 80 and 87 per cent. Inasmuch as there was no greater therapeutic effect, we returned to our original dosage of 150,000 units.

When we employed a mixture of penicilin with an absorption retarding agent, eliminating the water, our early results, using 150,000-unit dosage, were approximately the same as those with emulsion or with water solution in repeated doses. Within the past year, cures with 150,000 units in this mixture became fewer and fewer. Therefore, we doubled the dose for the initial injection. The therapeutic results were greatly improved by this increase in dosage to 300,000 units, ranging around 88 per cent. We have, therefore, increased our dosage in routine clinic treatments to 300,000 units.

Summary

A series of 14,756 patients was treated with different forms of penicillin, 10,156 of these were followed long enough for conclusive evaluation Ambulatory treatment, yielding cure rates between 78 and 88 per cent, can be effected by injection of 3 divided doses of an aqueous solution of penicillin, or a single injection of penicillin incorporated in an absorption-retarding oily mixture or emulsion, or by oral administration of properly buffered penicillin tablets. For efficient medical

^{*} Supplied by Commercial Solvents Corporation

and public health control of genococcic infection, the best practical method of treatment is a single intramuscular injection of an oily mixture of 300 -000 units of penicillin

Discussion

Robert S Westphal, M D, Rochester — A few months after Dr Rosentinal and his associates started using an aqueous solution of penicillin every two hours for three injections the State Department of Health became aware of their procedure and it was promptly recommended for use in the clinics and by the physicians of upstate New York. We never had any cause to feel that the technic was not good for ambulatory treatment with penicillin in its stage of development at the time

I was particularly interested in the comment that they had encountered no case of masked syphilis in spite of the fact that over 10 000 patients were followed scrologically for a minimum of three months. On the basis of that information I would like to suggest that the VD control officer and nurses in the Rochester Health Bureau Clinic should discontinue this practice. If we can treat 10 000 cases without finding a masked infection our organization should be able to proceed for some time without finding any However, we will probably continue to follow them for fear of missing one. Perhaps in any event, they should be followed for a lumer period.

longer period. In trying to determine the therapeutic efficacy of a drug, it is my opinion that as many variables as possible should be climinated. The authors indicated that their criteria for cure were 8 successive negative films and cultures taken at weekly intervals Unless the New York City patients vary con siderably from the Rochester patients 1 or 2 rein fections could occur in that length of time and the cases might be considered treatment failures. I would prefer taking specimens for microscopic and cultural tests at intervals not longer than two days. This would tend to rule out the variable of repeated infection, and if the treatment is at all effective the laboratory tests should be negative in a few days at most. Furthermore it is much easier to persuade patients to return for tests for six days than it is for three weeks. Thus fewer patients would be lost by the wayside.

I note also that prostatic specimens were obtained from the men in determining cure Since using penicillin, I have felt this to be unnecessary because prostatitis has ceased to be a common complication This may be true because we see of gonorrhea nationts earlier in the course of the disease in fact we rarely see a patient for the first time as long as a week after onset. This opinion has been confirmed by an unpublished report of over 200 negro men treated with penicillin In the follow up examina tion of these patients 3 methods were used for obtaining specimens. The specimens were taken from prostatic secretion, urine sediment, and by inserting a small cotton swab approximately 1 inch into the In more than 200 patients there was no instance of a positive film or culture from the prostatic accretion or uring sediment when the swab method was not positive

You may be interested in a newer technic for ad ministering penicillin which has been tried recently in Rochester A Rochester physician devised a handmade penicillin blower which administers finely powdered penicillin in either powdered glucose or dry blood plasma. This is accomplished by blowing the mixture into the patient's mouth while he in hales deeply It is said that by this method the penicillin level in the blood is more than twice as high as when it is administered intramuscularly and. thirty-six hours after the one application, the blood level is still above that required for therapeutic effect. Of course, more work is required on this regime but it is a simple, cheap method and not un comfortable for the patient

B VITAMINS AND FOOD UTILIZATION

Animal experiments have indicated that vitamin B complex deficiency interferes seriously with the intestinal absorption of glucose Such deficiency also causes marked loss of appetite and consequently of weight. A striking increase above normal was observed with respect to intestinal absorption of glucose food consumption, food utilization and weight gain in animals during recovery from such a deficiency with a vitamin B complex supplement. No one individual component of the B complex was found to be alone responsible for these effects.

Thiamin was found to have the greatest influence on the digestive functions of the body during recovery Pantothenic acid and riboflavin were less of fective. Pyridoxine seemed to be least effective. The investigators stress the importance of the vitamin B complex in the nutritional rehabilitation of war stricken populations. They point out that since the B vitamins increase the efficiency of food utilization the effect is virtually that of augmenting available food sources—Borden a Review of Nutrition Research January 1948

CHRONIC BENIGN PNEUMONITIS

Its Discovery in Older Individuals with Diminished or Absent Gag Reflex

Louis Schneider, MD, Mt Vernon, New York

(From the Chest Clinic, Washington Heights Health Center)

TERY wisely, chest x-ray surveys of the apparently healthy population are being done in increasing numbers and frequency Thus, more and more of the older age groups are being This group will come also into roentgen focus as a result of the drive to perform routine x-rays upon admission to general hospitals quite natural that among these older people, some by-products of tuberculosis case-finding will cause the examiner a good deal of concern refer particularly to the discovery of persistent basal pulmonary infiltrations on the routine chest film, unaccompanied by symptoms referable to the lower respiratory tract Even before chest surveys became a common procedure, such lesions have frequently been interpreted as representing bronchopulmonary neoplasm With the emphasis on early surgical eradication of such new growths, and with the perfection of lung surgery technic, such individuals have been and may continue to be subjected to needless lobectomy and pneumonectomy 12

It is for the purpose of emphasizing the importance of careful assay of asymptomatic basal pulmonary pathology, as disclosed by \-ray, that the following two cases are reported proof of the diagnosis is not available because of the reluctance on the part of these healthy men to undergo the necessary confirmatory tests The writer would have liked to obtain bronchoscopic examination and even aspiration biopsy to prove that we are dealing here with chronic benign aspiration pneumonitis 34 In the absence of socalled characteristic sputum findings, the careful case history, physical examination, and \ray appearance of the lesions, taken together, made up the diagnosis which apparently has been confirmed by the observation of time

Case Reports

Case 1—H S, a sixty-two-year-old white man, a native of Italy who had lived in this country forty-four years, was a retired realtor, living in financial comfort. His family history was negative as well as his past history, except for longstanding postnasal drip and large left hydrocele.

As a result of a case-finding \-ray in his community, a phthisiologist ordered this man into the hospital with a diagnosis of "atelectasis due to new growth or unresolved pneumonia" He appeared at our clinic for the first time on August 13, 1946, protesting against this recommendation with which his bewildered family had anxiously concurred

On admission to the clinic, he insisted that he felt as well as ever except for the slight discomfort due to the hydrocele—Physical examination revealed a well-nourished, well-preserved individual who looked younger than the stated years—Temperature, pulse, and respiration were normal—The following pertinent data were recorded—There were no remarkable throat findings—The heart was negative. The lungs were entirely clear—There was no clubbing of the fingers—There was a left hydrocele the size of a large orange.

The first chest x-ray was taken on April 30, 1946, and showed the same abnormal shadows as seen in the celluloid reproduction of June 17, 1946 (Figs 1 Here we see a large, dense, ground glass lesion, confined to the right middle lobe, and a small irregular patch of hard density above the left mid diaphragm Sputum, obtained with difficulty, was negative for acid-fast bacilli The blood count showed a slight secondary anemia It occurred to us that this might be a case of nonsymptomatic oil aspiration pneumonitis Careful questioning revealed that he had been taking mineral oil for con stipation for the past twenty years He was in the habit of drinking this product directly out of the bottle, ingesting several tablespoonsfuls nightly and sometimes during the day Hardly a day passed without his taking about two ounces of the hydrocar

Fig 1 The film taken June 17, 1946, shows a large patch of ground-glass density adjacent to the right heart border and a smaller patch above the left diaphragm. The bilaterality of the basal lesion led to the suspicion of mineral oil-aspiration pneu monitis rather than bronchial neoplasm.

Fig. 2. An oblique view showing the lesion to be predominantly in the right middle lobe

Fig. 3. The film taken eleven months after the first x-ray showing no change in the extent or character of the basal process

bon Re-examination of the throat revealed almost complete absence of the gag roflex The patient was otherwise neurologically negative.

In order to allay apprehension the patient was advised that the pulmonary findings were not due to malignancy but were the result of his laxative-taking habit. He was advised to switch to pills for bowel control. Unfortunately he could not be convinced of the necessity for bronchoscopic examination or a lung aspiration biopsy to confirm our clinic impression. The sputum submitted did not show the presence of mineral oil by the usually recommended tests 1 With some coaxing, he was seen on a few occasions after the first visit the last examination being made on March 27 1947 After almost a year of observation, he has remained as well as ever has even gained some weight and has had no intercurrent illnesses Eleven-month serial film follow-up shows no change in the appearance or extent of the basal lesions as originally seen (Fig. 3)

Case ! — E. O a white man, aged forty nine was born in the United States of Norwegian extraction. Both family and past history were negative.

This man is in good health. On December 21 1946, a pre-employment chest x-ray revealed a right basal lesion. He was sent to our clinic for an opin ion regarding these lung findings and was admitted for observation on February 10 1947 He denied any symptoms whatever at that time and revealed no remarkable findings on physical examination. The lungs were entirely clear and there was no clubbing of the fingers. A ray of the chest on admission revealed a small patch of increased density adja cent to the right lower lung root this was unchanged in extent or character from the area seen on the chest film taken three months earlier Further questioning on his reappearance at the clinic disclosed that this individual has for the past four years been equiring neosynephrine hydrochloride jelly (water

soluble) into his nostrils twice daily. This procedure would often be followed by a coughing and hawking spell as the preparation entered his throat Examination of the throat revealed a complete absence of the gag refiex. The patient has remained well for almost six months of observation, and during this period all films have shown a stationary right basal lesion (Fig. 4). He was however ordered to discontinue the use of nasal medicaments

Fig. 4. This film shows a small patch of increased density in right lower lung field the lealen discovered on routine survey of a man habituated to the use of nasal Jelly. The patient has no symptoms referable to the lungs and the process has remained stationary during six months of x ray observation.

Comment

The extension of tuberculosis case-finding surveys makes it timely to call attention again to the phenomenon of chronic aspiration pneumonitis and especially to emphasize its frequently asymptomatic and benign charac-Most adult cases reported have been patients in hospitals for chronic diseases or for the aged, and have been debilitated individuals or those having dysphagia due to an organic neurologic condition such as multiple sclerosis or hemiplegia 5 The fact that this condition can be found in healthy persons, however, must always be borne in mind upon seeing silent basal lesions on x-ray film Then the examiner should embark on a searching inquiry not only concerning the repeated use of nasal medicaments, but also concerning the longstanding habit of taking mineral oil for laxative purposes It has been shown that even in the presence of a good gag reflex, some of the latter substance may run into the larynx because it fails to arouse that reflex properly

Cooper showed long ago that the experimental disposition of aspirated material is dependent entirely on gravity and inspiration suction 6 The location of this material is patchy and shows a tendency toward immediate aspiration into the Accordingly, we would expect to see benign aspiration pneumonitis, as discovered on survey films, almost always confined to the right middle or lower lobes In a state of more or less extended recumbency, as with chronic hospital cases, it is not surprising to see aspiration pneumonitis in the upper lobes as well 5

From the clinical-roentgen viewpoint, differential diagnosis of this condition should not be very Bronchiectasis withsuperimposed pneumonitis may be ruled out by the paucity or absence of physical signs and symptoms and by the absence of clubbing Active basal pulmonary tuberculosis does not give such an x-ray picture, as a rule, and will not remain stationary on serial follow-up, the absence of tubercle bacilli in sputum and gastric contents in the presence of such pathology also speaks against tuberculosis We bear in mind, however, that pulmonary tuberculosis, apical or basal, may occasionally be as much as moderately advanced on x-ray and yet give no respiratory or other symptoms

The most important differential diagnosis to make is from neoplasm As is well known, early diagnosis of primary bronchial new growth is essential to its effective surgical eradication Here the combination of history, lack of symptoms, and paucity of any chest signs in the presence of basal involvement, point more to aspiration pneumonitis than to tumor Radiologically. the finding of illdefined, dense, ground-glass infiltration, as seen in the first case, speaks more for the benign pathology under discussion, its bilaterality also speaks against new growth course, one cannot take a "wait-and-see" attitude, as was necessary in these cases, letting time rule out the possibility of the presence of neo-

Hence, when there is the slightest doubt about the diagnosis, a thorough study is indicated, including bronchoscopy, sputum examinations, and even aspiration biopsy, so that bronchial neoplasm may be diagnosed at the earliest operable stage

Summary

- Two cases of asymptomatic benign aspiration pneumonitis in older individuals are reported
- The diagnosis has been confirmed circumstantially by the observation of time
- The clinical-roentgen character of this disease is emphasized
- Its differential diagnosis from bronchial neoplasm is considered most important
- It is expected that more and more of these cases will be found-if properly diagnosed-as chest x-ray surveys proceed a pace

ANNOUNCE OPHTHALMOLOGY EXAMINATIONS

The American Board of Ophthalmology has announced that the 1948 practical examinations will be held in Baltimore, Maryland, from May 20 to 25, and in Chicago, Illinois, from October 6 to 9

Written qualifying tests will be held annually, probably in January of each year Applications for the January, 1949, written qualifying test must be filed with the secretary before July 1, 1948

Officers for 1948 are Dr Everett L Goar, Houston, Texas, chairman, Dr John H Dunnington, New York City, vice-chairman, and Dr S Judd Beach, Portland, Maine, secretary-treasurer All communications should be addressed to the American Board of Ophthalmology, Cape Cottage, Maine

THE ROLE OF CHOLINE CHLORIDE IN THE TREATMENT OF CERTAIN CASES OF DIABETES MELLITUS

Studies of Liver Dysfunction-I

Louis Pelner, M.D., Benjamin Davidson, M.D., Samuel Waldman, M.D., and Robert Margolis M.D. Brooklyn, New York

A LTHOUGH the liver plays a basic role in carbohydrate metabolism it has been neg lected in the management of the diabetic patient until very recently

Soskin and his coworkers stressed the importance of the liver in carbohydrate metabolism 1 They showed that (1) if depanceratized animals received a constant intravenous injection of insulin, just sufficient to maintain normal blood sugar administration of additional carbohydrate yields normal glucose tolerance curves, (2) if hepatectomised animals with intact pancreas are given a constant intravenous infusion of glucose just sufficient to maintain normal blood sugar ad ministration of additional glucose yields diabetic glucose tolerance curves, (3) when the liver is damaged by hepatotoxic agents, a diabetic type of glucose tolerance curve is obtained this experimental work it seems logical to deduct that the liver is of primary importance in carbohydrate metabolism

Biskind and Schreier pioneered in the treatment of diabetes by methods which apparently improved liver function ² Diabetes has been treated during the past twenty five years in terms of insulin deficiency. Biskind and Schreier suggested another possibility that because of liver damage the patient may not be able to respond to his endogenous insulin. Thus, the treatment may be carried out in 2 possible ways, by giving the patient exogenous insulin or by attempting to restore liver function. This may be possible in only certain cases of diabetes.

Many clinicians have long realised that there are two kinds of diabetes. One type of patient develops acideais easily, and another type goes along for years without attention to his diet spills fairly large amounts of sugar, and remains in comparative good health. The first type may be due to actual insulin deficiency and the latter type may be due to hepatic insufficiency.

Biskind and Schreier have used large doses of vitamin B complex from liver and from synthetic sources? The vitamin B factors included this min, riboflavin, niacinamide pyridovine, calcium pantothenate choline, inositol, and folic acid Good results have been obtained by this method of treatment, but these usually become evident

after an extended period of time. It appears that with such a large number of therapeutic factors to be given, it is difficult to administer a sufficient quantity of the active factor.

Two of our patients who responded later to choline by mouth were given three to four injections a week of vitamin B complex without effect. This therapy included enormous quantities of thiamin, riboflavin, niaconamide, pyridoxine, and calcium pantothenate but did not include choline chiloride.

We feel that the active principle in the B complex therapy of Biskind and Schreier is choline and this article is a preliminary report on the use of potent quantities of choline in some cases of diabetes mellitus

Fatty liver is a rather frequent finding in pa tients with diabetes Deparcreatized dogs, treated with insulin, often develop large, yellow, fatty livers.3 This condition could be prevented by the inclusion of raw beef pancreas in the diet. Later, it was shown that legithin was just as effective, and it was finally proved that the active constituent that prevents fatty liver in depan creatized dogs was choline. Casein was also shown to have hpotropic activity, which was demonstrated to be due to the methionine con Methionine acts by supplying methyl groups for the synthesis of choline.4 Experi mentally, other vitamin B factors besides choline were ineffective in preventing fatty liver or cirrhosis of the liver in animals

It was difficult to determine beforehand which cases would respond and which would not respond to choline. The usual liver function tests were not helpful. Results were usually obtained in middle-aged individuals whose diabetes had existed for only a few years. However, we have several young diabetics who responded well.

Four Gm of choline were given each day One Gm was dissolved in 1 dram of water and administered by mouth four times a day. If the treatment was successful improvement was usually noticed within two weeks. The blood sugar level fell, the patient gained weight and there was a marked improvement in well-being. If the patient was on insulin therapy, coincidentally, the insulin desage was reduced and finally eliminated entirely. Some of the patients have now been on choline for the past six months with salutary effect on the carbohydrate metabolism and with-

Presented before the Eastern Section of the American Pederation for Clinical Research, New York City December 14 1945.

out ill effects on the body The diet used in this treatment was liberal, consisting usually of 250 Gm of carbohydrates, 95 Gm of protein, and 75 Gm of fat (2,055 calories per day)

Eighteen diabetic patients were successfully treated, while eight did not respond to the medication. Some very spectacular results were seen

Case Reports

Case 1—A 50-year-old male with recent development of diabetes, loss of weight, weakness, a blood sugar of 345 mg per 100 cc of blood, and 2 per cent sugar in the urine responded to 4 Gm of choline per day. Within two weeks the blood sugar fell to 180 mg per 100 cc of blood, and the urine became sugar free, although the diet described above was administered. Subsequently, the blood sugar fell and continued normal on the same regime over a period of six months. The patient feels well and has gained weight.

Case 2—A 25-year-old man who had diabetes for eight years and whose mother is also a diabetic was taking 25 units of protamine zinc insulin daily. In spite of this, the blood sugar hovered around 200 mg per 100 cc of blood. Following the institution of this regime, the blood sugar fell to normal on the same dosage of insulin, and subsequently stayed normal, even though the insulin was discontinued entirely.

Case 3—A 59-year-old female had lost a great deal of weight over a period of two years. The urine showed 2 per cent sugar and the blood sugar level was 200 mg per 100 cc of blood. For more than one year she was given 18 capsules a day of a formula exactly like that used by Biskind and Schreier.

Each capsule contained 5 mg of choline chloride besides other vitamin B factors. Her blood sugar level was constantly around 160 mg per 100 cc of blood, although subjectively she felt markedly improved. The capsules were discontinued, and for a two-week period choline chloride was administered, 4 Gm daily by mouth. Her blood sugar fell to 120 mg per 100 cc of blood.

Other cases, equally dramatic, were studied We want to emphasize that choline chloride is not a substitute for insulin but has been of aid in the management of certain cases of diabetes. A method for selecting cases which might respond would be of aid, but so far none is available. It was noted that some of the patients who were benefited greatly have cholesterol deposits around their eyes. Perhaps those diabetics with a high blood cholesterol may be the best subjects for a trial with choline chloride. Other vitamins should be included in the therapy, because diabetic patients are often markedly deficient.

ANNOUNCEMENT

1948 Medical Directory Deadline

All material for the 1948 Medical Directory of New York, New Jersey and Connecticut should be in the office of the Medical Society of the State of New York before April 15, 1948

No corrections or additions may be made after that date

PRIMARY FACE PRESENTATION

SIMON BRODY M D Brooklyn, New York

HYPEREXTENSION of the head before the onset of labor is very rare. Usually this condition occurs after labor has set in resulting either in a brow or face presentation DeLee states, 'As a rule, face presentations are fully developed only after labor has been fully in progress for some But in four cases I distinctly felt the full face lying over the inlet in the last month of preg nancy " According to Beck, Trimary face presen tations are extremely rare and in practice the possi bility of its occurrence is disregarded. The author has seen but one instance of face presentation before the onset of labor, the diagnosis of which he was able to confirm by x ray In that case spontaneous flexion occurred when the patient went into labor and the child was born as a vertex,

The report presented here is of interest since it was a case of hyperextension of the head, recognized about five weeks prior to delivery and confirmed by x ray findings. It also poses the problem of the management of such a complication.

Case Report

P 8, a 25-year-old white primigravida, was first seen in consultation on December 11, 1946. Het last menstrual period was on January 4, 1940. The expected date of delivery was November 7, 1946. Her past personal history was of no special significance. She started to menstruate at the age of thir teen every twenty four to thirty days the periods lasting four to five days. The prenatal course was uneventful. 2-ray examination on November 8, 1940 (Fig. 1) showed a face presentation at the infet

Fig 1 Face presentation as shown by x-ray on November 8 1046

According to the measurements there was a slight disproportion between the head and pelvis. In the opinion of the roentgenologist, spontaneous deliving might ensue, should the head come through in its shortest diameter. A test of labor was advised.

On December 11 the patient was still up and about. Fetal heart sounds were of good quality Membranes were intact and the patient had no complaints. Her urine was essentially negative Blood pressure was 112/80. Her blood was Rh positive type A.

Another v ray study of the pelvis was made according to the Caldwell and Molloy method (Figs. 2 and 8) Examination of the abdomen showed a single fetus with the face presenting. The fetal spine lay to the maternal left side and the face was seen on the right side of the pelvic inlet. The head was markedly overextended. The pelvis showed a fairly good inlet predominantly of a gonecoid configuration with a true conjugate of 13 4 cm. and the widest transverse diameter of 112 cm. The posterior saggital measurement at the inlet was 5 cm, at the midpelvio plane it was 5 cm. The bisschild diameter was 9 cm. Under normal circumstances, with a presentation of a more ordinary variety delivery from below could be accomplished. However with the face presentation noted above, delivery from below might be dangerous for the fetus.

Considering the fact that the patient was definitely postmature, with some cophalopelvic disproportion and extreme hyperextension of the headfurther delay seemed inadvisable and it was decided

to deliver her by section

On December 12, a low flap cesarean section was performed at the Crown Heights Hospital under fractional spinal anesthesia. Upon opening the uterus, the amniotic fluid was found to be meconiumstained A baby boy was delivered without any difficulty. He weighed 8 pounds 14 ounces, and was livid. The skin was meconium-stained. There was delayed respiration and there was no er. The head remained hyperextended for some time and there was an indontation between the scapulac where the occipit was pressing against the spine After sucjoin of the traches and administration of oxygen, the baby began to breathe and cry but the respirations were irregular and the cry was feeble The baby was placed in an incubator and given supportive treatment. In spite of all efforts the unfant expired about twelve hours after delivery. An autops showed atelectass of both lungs and dilatation of the right ventricle.

The mother made an uneventful recovery and was discharged from the hospital on the ninth post operative day

The interesting feature of this case is the existence of a face presentation for at least five weeks before delivery. By studying the baby a posture in utero as seen by the lateral view of the x-ray plate one can realize the extreme hyperextension of the head. Remaining in this abnormal posture for such a long period of time is probably injurious to the fetus. This was shown here by the meconium-stained amniotic fluid which was a sign of fetal embarrassment and the pulmonary atelectasis secondary to it

Lateral view of an x-ray, taken on December 11, 1946, showing a face presentation still present five weeks later

Posner and Buch, in a study of face and persistent brow presentation, showed that there was a higher incidence of maternal and fetal morbidity and mortality in cases of extension of the head? They advocated that cesarean section should be given greater consideration than heretofore, in cases in which face presentation is diagnosed early, especially in primipara

It would, therefore, seem advisable, in a case like the one presented here, when the condition is recognized early, not to procrastinate, but to deliver the baby by cesarean section as soon its viability is

In this way the danger of intrauterine embarrassment to the fetus by its long, abnormal position will be lessened, and the tragic consequences of the case reported here might be avoided

ONLY 5 PER CENT FAIL TO GET POLICIES Ninety-five out of 100 applicants for life insurance obtain policies, the Institute of Life Insurance reports This is indicated by an analysis of one year's applications of companies representing approximately one half of all ordinary life insurance purchased. The study, just concluded, shows that over 95 per cent of the applicants received policies, 85 per cent being standard rate policies and 10 per cent evtra rate policies

Fewer than 5 per cent did not secure the life insurance they applied for, and these failed to qualify

Detail of the plate, taken on December 11, showing the extreme hyperextension of the head

Summary

A case of primary face presentation, diagnosed by x-ray five weeks before delivery, is described patient was delivered by elective cesarean section The fetus suffered some intrauterine embarrassment as evidenced by meconium-stained amniotic fluid, in spite of the fact that the patient was not in labor and the membranes were intact Respirations were delayed and irregular, and the cry was feeble baby died at the end of twelve hours due to pulmonary atelectasis, as proved by autopsy findings This may have been caused by the precarious position in which the fetus remained for such a long period of time, as demonstrated by repeated x-ray examinations taken five weeks before delivery and, again, one day before delivery

Early interference by cesarean section may be indicated in such cases

chiefly because of serious physical impairments Heart trouble and high blood pressure constituted the chief causes of uninsurability, together account-ing for one half of all the cases Overweight was another important cause

Fewer than one half of 1 per cent of all persons applying for insurance failed to obtain it because of underwriting qualifications other than physical, including occupation, location of residence, applica-tion for too much life insurance relative to income, habits, or excessive drinking

A PSEUDOMUCINOUS CYST OF THE OVARY WITH ASCITES AND HYDROTHORAX

SAMUEL S ROSENFELD, M.D., F.A.C.S., New York City

(From the Department of Obstetrics and Gynecology Lebanon Hospital)

THE triad of ovarian fibroma, ascites and hydrothorax, described by Meigs and bearing his name has now been observed and reported upon many times Lest practitioners, and especially medical students come to believe that only oversan fibromata are capable of producing ascites and hydrothorax, I believe it of value to report cases in which neoplasms other than ovarian fibromata were the causative tumors

Calmenson, Dockerty and Bianco report 9 cases of polvic tumor in association with ascites and hydrothorax treated at the Mayo Clinic from 1910 to 1045 of these, 5 were ovarian fibromatas 1 a degen erating uterine fibromyoma 1 a fibromyoma of the uterus with pelvic inflammatory disease of the ad nexae, 1 a granulosa cell tumor of the ovary and 1 a complete teratoma of the ovary 1

Frankenthal reported a case where a theca cell tumor of the ovary produced ascites and hydrothorax.

This report is made for the purpose of adding to the literature another case in which ascites and hydrothorax were present not in conjunction with a fibroma of the ovary but with a massive pseudomucinous cyst

Case Report

Mrs. A. U aged 34 was admitted to the hospital because of swelling of the abdomen which she had noted about five months previously and which gradually increased in a uniform manner. There has been no pain or tenderness associated with the

swelling.

Lately, she has noted shortness of breath, especially on climbing stars and coughing when she shifts her position in bed. There has been no hemoptysis nor pain in the chest. She is occa sionally dyspnele Her appetite is poor and she be-lieves she lost weight Bowel movements are regu She has never noted swelling of the ankles nor

any enlarged veins in the lower extremities

The menses began at twolve and until five years ago the flow was moderate lasting five days and occurring at 28-day intervals. In the last five years occurring at 28-day intervals. In the last five years bleeding occurs every 28 days lasts nine days is very profuse and accompanied by sovere pain on the third day of the period. For the last two months also has been bleeding every fourteen days for seven days. She has one living child, three years of age delivered in the eighth month of gestation. There is no frequency of the period of the contract of the

is no frequency difficulty or pain on micturition.

Examination revealed a thin woman who evidently had lost weight and who had a distonded abdomonabdomen Numerous moles are scattered over the akm, especially large ones at the lateral ends of the clavicles The thyroid is not palpable. The heart is normal. There is absence of breath sounds and vocal fremitus extending from the right base to the seventh rib posteriorly. This area is flat on percussion. In the axillary line these signs extend to the apex of the axilla

The swell The abdomen is distended markedly ing is large uniform and corresponds in size to a twenty-eight weeks pregnant uterus No fetal heart sounds are heard. Small lymph nodes are palpable in both groins. There is no swelling of the ankles and no varicose veins are visible

The blood count on admission showed hemoglobin, 110 Gm. red blood count, 4 330,000 and white

blood count, 6,650

Differential count was polymorphonuclears, 68 per cent, lymphocytes, 26 per cent band forms 5 per cent, and mononuclears, 1 per cent. Sodimentation rate was 55 mm. after one hour (Westergreen). Blood Wassermann was negative

Blood chemistry preoperative showed sugar 68

Blood chemistry postoperative showed total pro-class, 6.2 Gm. per cent albumin 3 7 Gm. per cent and globulin 2 5 Gm per cent.

The urine on admission had a specific gravity of 1 032 and showed an occasional red blood cell and white blood call.

Radiographic examination of the chest and fluor oscopy disclosed pleural effusion on the right side extending to the level of the fourth rib in the axillary line No gross changes were visible in the left lung. There was no displacement of the cardiac shadow

Thoracentesis was performed and about 1 200 cc. of clear yellow fluid obtained. Culture proved the fluid to be sterile. Microscopic examination failed to reveal any tumor cells

The presumptive diagnosis was multiple uterine fibroids associated with either a papillary cystad enoma of the ovary or a fibroma of the ovary operation a massive pseudomucinous cyst of the right overy and a moderately enlarged uterus con taining several intramural fibroids, was found.

The ovarian tumor occupied the greater part of the abdominal cavity About two liters of free fluid, the abdominal cavity About two increases ince have, similar to that seen in the cyst cavity was free in the abdominal cavity. The left ovary appeared normal. There were no peritoneal implants. The liver and There were no peritoneal implants. gallbladder were normal.

The cyst was removed in toto except that a small daughter cyst apparently ruptured on the poeterior surface while the mass was being removed. The

abdomen was closed without drainage.

Dr Joseph C Ehrlich, the pathologist reported as llows Ovarian cyst, measuring 25 by 27 by 11 follows cm was completely encapsulated except at one end where there was a partial rupture about 3 inches Mucinous fluid appeared to be leaking this rupture The capsule of the cyst had across. through this rupture a very smooth deeply congested appearance with a few fibran deposits but no evidence of papillary implants. There was no necrosis nor hemorrhage visible from the surface. The cyst contained inplants. numerable daughter cysts of various sizes ggregate cyst content was calculated at about 14 000 cc and consisted of thick albuminoid yellow ish material. All of the cysts examined had a smooth lining There were no areas of solid tumor

Section revealed various evats lined by a single

layer of columnar cells of the mucinous or goblet type The stroma of the cyst wall was composed of rather cellular fibrous tissue which was quite vascular There was no histologic evidence of malignant character or invasive tendencies

Diagnosis —Pseudomucinous cystadenoma of the ovary

Summary and Conclusion

A case is reported in which ascites and hydrothorax were associated with a pseudomucinous cyst of the ovary and not a fibroma. Cases exhibiting the triad of ovarian tumor, ascites, and hydrothorax can easily be confused with ovarian malignancy and metastasis It is essential, therefore, that a thorough study and evaluation of the case history, physical, and laboratory findings be made before a patient exhibiting the triad is refused, or advised against, operation

The convalescence was uneventful and at this writing the patient is about ten weeks' pregnant

MISSISSIPPI VALLEY MEDICAL SOCIETY ESSAY CONTEST

The eighth annual essay contest of the Mississippi Valley Medical Society will be held in 1948, and is open to any member of the American Medical Association who is a resident of the United States

A cash prize of \$100, a gold medal, and a certificate of award are being offered by the Society for the best unpublished essay on any subject of general interest (including medical economics and education) and practical value to the general practitioner of medicine Certificates of merit may also be granted to the physicians whose essays are rated second and third best

The winner will be invited to present his contribu-

tion before the thirteenth annual meeting of the Society, to be held in Springfield, Illinois, from September 29 to October 1, 1948, the Society reserving the exclusive right to publish the essay in its official publication, the Mississippi Valley Medical Journal

publication, the Mississippi Valley Medical Journal All contributions must be typewritten in English in manuscript form, submitted in five copies, not to exceed 5,000 words, and must be received not later than May 1, 1948

Further details concerning the essay contest may be secured from Dr Harold Swanberg, secretary, Mississippi Valley Medical Society, 209-224 W C U Building, Quincy, Illinois

ARMY MEDICAL CORPS HAS OPENINGS OVERSEAS IN SPECIAL FIELDS

The US Army Medical Department announces the availability of opportunities for advanced training and experience in the various special fields of medicine and surgery in overseas Army hospitals. These hospitals are registered with the American Medical Association, and this training may be acceptable by the specialty board as part of the period usually required to be spent in limited practice and experience prior to admission for examination.

Interested members of the medical profession who have completed the formal training requirements for certification in one of the special fields are eligible to apply for these positions. Openings available, as of January 1, 1948, which will be kept open until filled, include—eye, ear, nose, and throat, 7, ob-

stetrics and gynecology, 14, anesthesia, 7, ophthalmology, 3, otorhinolaryngology, 3, neurosurgery, 1, orthopedic surgery, 5, thoracic surgery, 1, plastic surgery, 1, radiology, 11, internal medicine, 24, dermatology, 3, neuropsychiatry, 15, pediatrics, 10, cardiology, 2, and pathology, 1

Eligible physicians are invited to communicate with the Surgeon General, US Army, Washington 24, DC, for further information Inquiries should include name, address, age, nationality, mantal status, dependents with age of each, medical school and graduation date, internship and date, details of graduate training, specialty and geographic location desired, contemplated length of service, and details of prior military service

SOME ASPECTS OF THE PROBLEM OF THE NEW YORK STATE MENTAL HOSPITALS SYSTEM

Report by the Committee on Public Health Relations of the New York Academy of Medicine Prepared by E H L Corwin, Ph D and THELMA PIERCE, New York City*

THE care of the mentally ill is the outstanding medico-social problem of New York State An indication of its magnitude is the fact that 25 per cent of the annual operating budget of the state is expended for this service, and even this sum is numificient to meet adequately the needs of the state mental institutions. Whether there has been an actual increase in the incidence of mental disease or whether the increased admissions to mental hospitals indicate only an increased tendency toward hospitalization cannot be stated with accuracy The fact remains that the state hospitals are caring for patients in excess of their rated capacity, in some instances by more than 30 per cent.

That something must be done to relieve if not to remedy the situation is apparent. Competent bodies such as the American Psychiatric Associa tion have prepared thoughtful long range plans for the improvement of the state mental hospitals, The soundness of these plans is not to be questioned in point of the goals to be attained. Unfortunately, the implementation of the plans is not of immediate possibility partly because of the expenditures involved and also because of the lack of the necessary trained personnel. What is attempted in this report is not the delineation of an ideal but the formulation of practical suggestions for improvements which

The experience and observation of the members of the Committee have been complemented by information secured from the Commissioner of Mental Hygiene of the State of New York, from representative state hospital directors and from other sources. These data have been combined with those obtained from the comprehensive literature on the subject to form the basis for this report.

Principal Problems

Overcrowding of Institutions—Most of the problems of the state mental hospital administrators are aggravated by the fact that the majority of the institutions house more than their rated capacity The Annual Report of the Department of Mental Hygiene for the year ending March 31 1044, the last printed roport, stated that the number of patients in state mental hospitals was 14 6 per cent in excess of rated capacity. At the present time the overcrowding is from 25 to 35 per cent in the institutions that it was 14 for the present time the overcrowding is from 25 to 35 per cent in the institutions that it was 14 for the state of the present time the stitutions close to New York City

Many factors have contributed to the over crowding of the hospitals. Not the least important of these is the aging of the population which has increased the number of potential senile and artero-selerotic patients. The longthening lifespan will continue to contribute to this potential group. But perhaps the most important reason for the

Onder the guidance of a subcommittee composed of Charles Gordon Hayd, M.D., chairman Fraderick R. Balley M.D., Carl Bisger M.D. Hubert S. Howe M.D. and S. Bernard Wortis, M.D.

increase in the actual number of admissions of senile and arteriosclerotic patients is fundamentally sociologic. With the exodus of women into business and with the trend toward smaller living quarters the care of the aged in the homes of relatives has become well-nigh impossible. The aged are being placed in state hospitals if they exhibit even minor mental symptoms. This has resulted in crowding the wards of the state hospitals with patients who primarily require supervision.

It has been suggested that separate units for the care of scnile and arteriosclerotic patients be established in connection with either state mental hospitals or general hospitals, county or voluntary These patients need a type of care which differs from that required by other mental patients Their mental derangement however does necessitate the employment of personnel experienced in the care of mental illness For this reason homes for the aged would be unsuitable in that they would not provide sufficient protection for such patients.

Dementia praceox patients, who make up the largest percentage of the mental bospitals popula

largest percentage of the mental nospitals popula-tion 56 per cent will probably continue to require about the same proportion of hospital care in the future as they have in the past since the number of such patients on the hospital's books has varied little in recent years. The use of shock therapy and preventive measures may reduce the size of this group but the gain so obtained will not be appreciable until more effective preventive and therapeutic technics are devised and utilized. These require specially trained personnel in every state mental hospital.

It is regretiable that the experience with shock therapies is not being systematically and completely reported In addition, research in the blopletely reported In addition, research in the blo-logic physiologic endocrinologic and psychologic phases of domentia praecox is urgently needed Adequate programs for the study of this problem should be undertaken in the mental hospitals and provision should be made for stimulating contact with other research workers in this and allied fields.

Manic-depressive patients made up about 6 per cent of the first admissions to New York State large numbers of these patients were discharged either as recovered or improved it is well known that they form a high percentage of readmissions to the institutions. Present-day knowledge of this disease does not indicate great hope that the size of this group will be reduced greatly in the near future.

There are however, two groups of patients who to a large extent can be expected to disappear from the rolls of the state mental hospitals. The first the rolls of the state mental hospitals. The first of these groups is that of the general parctic pattents. New methods of treating syphilis and the program of public education with regard to early treatment of this disease should make possible an almost complete elimination of general parens in

the not-too-distant future Should this be consummated, there will be a release of 5 per cent of

the existing bed capacity for other types of patients

The second group of patients who can be
climinated to a large extent from the mental hospitals are alcoholics Few of this group require For the most part, alcoholic long-term care patients admitted to mental hospitals are suffering from acute episodes and do not need the type of care which the state mental institution is planned and equipped to render. With few exceptions, alcoholic patients can better be cared for in special divisions of general hospitals. A period of observation in the general hospital, of sufficient length to determine the probable duration of the aberration, would make it possible to eliminate from the state hospital rolls all but those few alcoholic patients whose mental illness is of a per-Proper methods of treatment manent character designed to reach the root of the difficulty and carried out in a special unit of the general hospital. should make it possible for many alcoholics to return to society, those who are irredeemable should

be placed in appropriate farm colonies

A procedure which could be expected to result
in the reduction of the number of patients in the
state mental institutions is that of the re-examination and possible rediagnosis of all patients often patients who apparently require only custodial care are relegated to the "back wards" of the institutions where they may not be seen by a com-petent psychiatrist for months and sometimes longer A certain percentage of these patients might, with proper reconsideration of their condition, be discharged, placed on "convalescent status," or sent to "family care," a form of foster home care Any one of these dispositions would relieve the pressure on overworked staffs

It is recognized that the reclassification of all state mental hospital patients is a gargantuan task and one which may well be beyond the physical capacity of the psychiatric staffs of the institutions It might be possible, however, to obtain the services of teams of outside psychiatrists to assist in this work of reclassification. The over-all benefits of such a task might well justify the expense for such Staffs should be adequate to make a service periodic examinations of all patients and thus obviate the necessity of undertaking such a task at a particular time

The "family care" program of the state mental hospitals should be re-evaluated The remuneration of persons undertaking this type of responsibuilty should be brought to a level which would make it possible to obtain suitable homes for the patients and which would induce more families to accept patients Many patients might be of service to farmers, for example, and the shortage of man-power in the agricultural field should interest farmers in taking on such helpers if the allowances were consistent with the present cost of hving

The establishment of adequate clinics for outpatient care throughout the State would prevent the commitment of some patients by providing ambulatory psychiatric service for them, it would make possible the release of patients who are now in institutions only because they need supportive therapy which at present they otherwise cannot obtain. The sooner a mental patient can be returned safely to his community, the less is the danger of his becoming "institutionalized" and requiring a prolonged or permanent stay in the hospital

At no time should a patient remain in a mental

A. 15 - 2

hospital because of the contribution he may make

to any service of the institution

Understaffing—Whenever it becomes necessary to crowd patients in an institution the task of caring for them mounts in a geometric ratio sufficient space necessitates the use of recreation rooms as dormitories and thus makes more difficult the provision of proper exercise and relaxation for The crowding of wards makes thorthe patients ough cleaning a problem and adds to the likelihood, of friction and irritation among the patients. These and other factors call for the employment of additional personnel Unfortunately, most state mental hospitals have available less than their approved quotas of all types of personnel

The low salaries paid by the state hospitals make impossible the attraction of attendants of a caliber able to contribute to a constructive recovery Inadequate examinations and the necessity of hiring such personnel from Civil Service lists aggravate the problem And inept handling by an attendant can retard the progress of a patient

for months, or even permanently If the psychiatrists provided for in the New York State budget were in service, the ratio of patients to psychiatrists would be 161 to 1, actually it is 187 to 1. The lack of sufficient psychiatric staff precludes proper psychotherapy for many patients Patients who receive shock therapy require, for best results, complementary psychotherapeutic interviews. These interviews need not be lengthy but should be held daily to make certain that the patient obtains proper insight into his condition and is thus in less danger of a relapse

Low salaries, unsuitable housing, and the poor quality of the food make state mental hospital work unattractive to ambitious and alert psychia-When to these factors are added a lack of contact with other medical disciplines and a lack of a stimulating program of treatment and research, the difficulties in obtaining trained psychiatrists for the state institutions are increased

Those responsible for the administration of New York's mental hospitals constantly appeal to the Legislature for additional funds with which to do a proper job, often without avail Even in the face of this handicap, it might be possible to attract young men and women if sufficient intellectual stimulation and a good work environment were offered

A program which would provide additional hospital personnel and which would be of benefit to all future physicians would be the inclusion of a three-month residence in a mental institution as a part of the regular rotating internship plan presupposes a regular hospital staff competent to train young men, an active program of treatment, and, wherever possible, research

Those mental hospitals which aspire to train psychiatrists must of necessity have adequate staffs and proper facilities for training number of psychiatrists needed in the United States is estimated at 10,000 at the present time. We have but 3,500. Only an active, forward-looking mental hospital program can meet the need

The housing and maintenance of state hospital personnel should be improved wherever it is below In those institutions in which there is a standard shortage of space, the possibilities of temporary or permanent outside housing for employees should be Attractive housing of employees is an considered important factor, since maintenance constitutes a large portion of their remuneration Apparently, it is difficult or impossible to obtain additional money

When most of the mental hospitals were built, the prevailing opinion was that psychotic patients should be seen as little as possible, the basic reason for placing such matitutions in rural locations. A little of the superstition of "possession" still clings to

mental disease
A step toward the cradication of this medieval
attitude would be to place mental hospitals in
urban locations where they would stand in the
current of general medical activity. This change
upon a period of training in the care of the
mentally ill It would make possible the patients'
the visits of relatives and friends, and it would keep
the visits of relatives and friends, and it would keep
the visits of relatives and itsenting a forward
approach similar to that of other types of institutions for the care of the sick

In view of the reports that mental illness occurs in about one out of every five families in the United States, that much of such illness can be prevented or allevisted by proper treatment, that mental better and more training should be provided for those interested in working with mental patients, it is imperative that the facts of the present situation be brought to the attention of the proper authorities, and particularly of the legislators, in order that adequate preventive and curative measures may be provided.

Summary and Recommendations

In approaching the whole problem of the care of the mentally ill, it was realized that there might be no finality to the conclusions reached, that the problems and their solutions might change with problems and their solutions might change with changing conditions. At present, however, the mental hospital administrators of the State of the Mw York face difficult and numerous problems, not patients than the rated capacity of their institutions. Lack of adequate funds makes impossible the procurement of sufficient and competent personnel. Obsolete buildings in had competent personnel. Obsolete buildings in had competent procurement of sufficient and of them located in remote sonnel. Obsolete buildings in had repair and of medicient design, many of them located in remote places and away from contact with progressive medical procedures, and to the complexity of the sutuation

Public indifference to the fate of mental patients reflected in the depersonalization of the care rendered to state hospital patients. Research is needed in the hospitals, not only to determine some of the possible physiologic causes of mental disease but also to act as a stimulus to attract alert and program presupposes competent personnel and program presupposes competent personnel and program presupposes competent personnel and mould make possible the establishment of urgently meeded training centers for interns and medical students

Because it is apparent that immediate measures must be taken to alleviate certain manifest deficiences and that plans must be laid for the future, recommendations should be based on three proximate measures of time

I Immediate—to correct existing deficiencies in the shortest possible space of time and with the least possible expenditure of funds

2. Interntediate—to project short-range pro-

The microscape expendence of the property of the state of

and would preclude the commitment of many patients. The Plan estimates that 8 beds per 1,000 population are needed for mental patients, of these, 0 3 bed per 1,000 population should be provided in general hospitals.

It has been recognized only recently that much of mental illness has its origin in the maladyistments which arise from life in an increasingly complex society. Psychiatric clinics are needed for those who find themselves faced with problems beyond who find themselves faced with problems beyond which another competent payentairs guidance might be obtained at low cost. Because of the lack of such facilities many persons with early symptoms of mental illness grow promitted eating worse until commitment to a state mental pospital becomes the only solution Accurate estimates of the number of persons who could have estimates of the number of persons who could have madications are that the number of persons but all indications are that the number of persons undications are that the number would be large to estimate the contractions are that the number would be large orders on the properties of the average citizen too expensive for the average citizen

Psychiatric clinics would serve still another purpose They would make possible the discharge from mental hospitals of many of those patients who remain in the institution solely for supportive treatment. With the establishment of proper clinics these persons could live in the community and, in some cases, might be able to work and to earn at least a portion of their own expenses.

The value of adequate psychiatric facilities for young persons cannot be overestimated The value of schools of

bered that schizophrenic patients constitute the bulk of the state hospital population. The variety of groups which could be served by

The variety of groups which could be served by well-run psychiatric chinics is too great to enumerate To mention only a few the courts of domestic quency, boards of education and health, visiting nurse or faminate in wellare agencies. Funds for the maintenance of these chinics should be provided by the state. To accomplish this, it may be necessary to amend the eliating state law.

Dr George S Stevenson, medical director of the National Committee for Mental Hygiene, has stated that, "What we need today is an entirely new concept of public psychiatry". At present, "Public psychiatry is not focused on the community where the mental problems originate and to which where the mental problems originate and to which

Public psychiatry is not focused on the community where the mental problems originate and to which the patient must return if treatment is successful What we need is to realize that the mental hospital constitutes only one aspect of the whole field of public psychiatry."*

The psychiatry was a specific to the whole successful to the second of the whole second or t

The rapid growth of the American hospital system has resulted in an emphasis on the hospital rather than on the patient. A hospital-focus rather than a patient-focus is noted in the state mental hospitals. The individual is lost in the mass. He becomes but the bearer of a diagnostic label, his name is frequently unknown even to the nurse on harmy ward

This depersonalized attitude is due in greater part to the enormous size of most of the New York State mental institutions. In smaller part it is due to a merry-over of public indifference to the fate of the wantedly ill Public thinking has not yet advanced to the stage where it can recognize that ill-past of mental character is no less an illness that is that of physical character.

PROS AND COMS OF AIR SANITATION

The potentialities of an sanitation in the control of a wide variety of respiratory and infectious diseases appear to be great, but concrete results have not yet maternalized, according to Dr Alexander Langmunt, associate professor of epidemiology, Johns Hopkins University This situation he attributes to epidemiologic limitations rather than to engineering technics

As commonly used, the term "surborne infection" applies to a large group of respiratory and contagious diseases and also to skin and wound infections Yet, for many years these same diseases have been considered almost universally to be contact infections if there are four routes by which they travel from one individual to another contact, droplet, droplet, and dust

droplet nuclet, and dust

The term "surborne infection" should be restricted, Doctor Langmur explained, to the transmission of disease through the air vith distances of more than three feet between the infective source and three feet between the infections are incore than three feet between the infections are dusting a regiment in such infection—droplet nuclei and dusting against n high four types of technics are considered assumet n high four types of technics are considered most useful

Alcohanteal ventilation by the introduction of clean filtered arr in controlled currents achieves a limited removal of droplet nuclei and dust. This method is uneconomical and inefficient in most occupied appaces as a means of dismicecting arr but has wide application in the general field of air conditioning and particularly in specialized fields such as surgical and particularly in specialized fields such as surgical operating rooms

In aummary, Doctor Langmaur said that effective engineering technics for the disinfection of air are available. These are useful in preventing the spread of disease in a few limited environments where air is, surgical operating rooms, pediatric and contagone infection is an important mode of transmission, i.e., surgical operating rooms, pediatric and contagons userial, and research laboratories where agents of human disease are under investigation. Controlled studies in other environments such as schools and institutions, military and naval barracks, and sanatoria and mental hospitals, offer best prospects for extensing mental hospitals, offer best prospects for extension of air sanitation—Health Neus, October 20, 1947 sing of air sanitation—Health Neus, October 20, 1947

After discussion, it icas roled that the Council send word to the podiatrists through Dr. Dattelbaum s committee that if they introduce legislation within the framework of this and not exceeding it the

Medical Society will not oppose it

Constitution and Bylaws.-Dr Rouling chairman reported he had received a letter from the Secretary Dr Anderton, suggesting that the following changes be made in the State Society Bylaws in regard to election of delegates to the American Medical Association in order to conform to A M.A proposed changes add the following clause to the first son tence in Chapter III Section 7 "to commence the first day of the January pext succeeding each dele-gate s election. The Section would then read "The delegates to the American Medical Association shall be elected in the calendar year preceding the meeting of the House of Dulcgates of the American Medical Association to which they are elected and in accordance with the Constitution and Bylaws of that body for a term of two years, to commence the first day of the January next succeeding each delegate's election. Delegates may be elected to other medical societies or similar bodies as the interests of the Society may roquire, and credentials shall be issued to all delegates, signed by the President and Secretary

It was roted that this be introduced at the next session of the House of Delegates from the

Dr Andresen stated a similar change should be made as applying to County Medical Societies

After discussion it was roted to refer this proposal to the Committee on Constitution and Bylaws for

study and report at the next meeting Report of Delegates to the American Medical Association House of Delegates.—Dr Winslow chairman of the Delegates made the following

Our Society was represented at the 1948 interim meeting of the House of Delegates of the American Medical Association in Cleveland Ohio on January

5 and 6 by

Walter P Anderton Herbert H Bauckus, Albert F. R. Andrewn Thomas M. Brennan James R. Reuling Floyd S Winslow, Ralph T B. Todd, O W. H. Mitchell Edward P Flood Albort A. Gartner Thomas A. McGoldrick, John J. Masterson, Stephen B. Mostelik J. Strate, Konvey Cooper, W. Kon. R. Monteith J Stanley Kenney George W Kosmak Thomas M D'Angelo Harry Aranow John T Donovan Scott Lord Smith, Walter W Mott

Dr Mitchell was appointed Chairman of the Reference Committee on Reports of Board of Trus-

tees and Secretary

Dr Andresen was appointed Chairman of the Reference Committee on Executive Session

"Dr Aranow was a member of the Reference Committee on Rules and Order of Business

'Dr Anderton was on the Reference Committee

on Hygiene and Public Health. "Dr Masterson was a member of the Reference

Committee on Medical Education 'Dr Winslow was a member of the Reference Committee on Miscellaneous Business

'Dr Todd was a member of the Reference Com mittee on Medical Service

'Dr Kenney was Chief Sergeant at Arms.

In addition to the regularly elected delegates from our society, Dr Roy B Henline was delegate from the Section of Urology and Dr Arthur J Bedell represented the Section of Ophthalmology Also present were Dr Louis H Bauer, a trustee of the American Medical Association Dr Edward R. Cunniffe, chairman of the Judicial Council of the American Medical Association Dr Laurance D Redway, literary editor of the New York STATE JOURNAL OF MEDICINE, Mr Dwight Anderson, carcutive secretary, Mr Thomas E. Walsh, public relations representative and Mr Gordon Marshall, advartising representative Our delegation ably represented our Society and took an active part in the proceedings Minutes of the meetings will appear in the Journal of the American Medical Asso-

It was voted that the term of office of delegates is to commence the January first following their

Economics.-Dr Wertz chairman referred to the following report of the Director of the Bureau of Medical Care Insurance

"The Subcommittee on Medical Expense Insur ance held two seemons one in New York at the Society offices, and one in Buffalo Docember 8 and Mr Farrell attended both sessions proposed program of Committee activities for 1948 was adopted as outlined in the Bureau report to the Council at the November meeting

December θ, 1947 Mr Farrell spoke before the Woman's Auxiliary to the Medical Society of the County of Orange at Middletown on the general principles of prepaid voluntary nonprofit medical

care insurance.

"January 5, 1948 As directed by the Subcommittee Mr Farrell visited the executive director of the Genesee Valley Medical Care Plan Rechester to discuss the Committee's recommendations on correspondence referred to it

January 7 1948 The Director visited the Medi cal and Surgical Caro Plan Utica, to discuss that part of the Committee s program for 1948 in which

the plans are to participate.

Report accepted

Ethics.-Dr James R. Reuling, chairman made

the following report

There was referred to the Committee on Ethics the new insertion Section 31 (b) that was adopted by the House of Delegates It was headed Publica tions for the Laity I will read it to you as it was adopted by the House

Publications for the Laity Members of this Society who have prepared and written a book, article or any writing pertaining to medicine for the lasty and intended for publication shall submit the same to the Council Committee on Public Relations and the Public Relations Bureau of the Medical Society of the State of New York for approval prior to any publication thereof In the event the book article or writing shall be so approved for publication then and in that event any proposed advertisement for or announcement of publication thereof shall be likewise submitted to the said Council Committee and Bureau for approval prior to any appearance thereof The reviewing committee shall render its in print opinion without unnecessary delay This committee shall be in the main guided by Section 31 of the Principles of Professional Conduct, but shall be empowered to make such concessions as may be practiced and necessary in considering the title of publication, the description of the content, the responsibility, standing, and reputation of the writer, and such other material through which the publisher wishes to arouse reader interest'

"That was referred back, and the Secretary now proposes that instead of 'Publication for the Laity,' this be headed 'Advertisements and Announcements of Publications for the Laity,' and that it read

"In the event that there is proposed any public announcement of or advertising in relation to any book or article or writing for the laity, such proposed announcement or advertising matter shall be submitted to the Council Committee on Public Relations prior to any public appearance of such an-nouncement or advertising matter This reviewing committee shall render its opinion without unnecessary delay It shall be guided mainly by Section 31 of these Principles of Professional Conduct, but shall be empowered to make such concessions as may be practiced and necessary, in considering the description of the title and contents of the publication, the professional standing and reputation of the author, and such other material through n hich the publisher may wish to arouse interest

"I think that takes away everything that has been objectionable in what was adopted by the last

House, and it refers now only to advertising

"For the sake of getting it before the Council I am going to move that this be approved by the Council for submission to the House of Delegates"

After discussion, it was voted that this report be approved and take the place of the report that was accepted at the previous meeting of the Council

Malpractice Insurance and Defense Board.—Dr Thomas M D'Angelo, chairman of the board presented an informative report to be considered in connection with the report which was made at the last meeting

Office Administration and Policies —Dr Anderton reported for Dr Masterson, chairman, as follows "The committee met on Tuesday, January 13, and considered routine matters of management and office procedure, also a bill from the Century Moving & Storage Company, for moving goods and chattels from the twenty-first to the seventh floor of 292 Madison Avenue, was explained by Miss Dougherty to the satisfaction of the Committee and referred to the Board of Trustees Dr Masterson requested information regarding who was in charge of the office when both Dr Anderton and Mr Anderson are absent at meetings and in regard to the survey of work in the office He was informed that Miss Doris Dougherty, Administrative Assistant, is in charge of the office when Dr Anderton and Mr Anderson are both absent "

Public Health and Education —Dr Bauer stated that Dr Mitchell, chairman of the Committee, had to attend an important meeting of the Committee on Hospital Planning for New York State, in Albany, so could not be present His report as distributed

with the agenda is as follows

Activities of the Chairman—On December 30, 1947, in Syracuse, conferred with William E. Ayling, M.D., Health Director, School Health Service, Syracuse Department of Education

January 5 and 6, 1948 Attended the meeting of the House of Delegates of the American Medical

Association in Cleveland, Ohio

January 14, 1948 In New York City the Council

Committee on Public Health and Education held the following meetings With the Subcommittee on Hard of Hearing and the Deaf, officers of the Medical Society of the State of New York and representatives of the State Departments of Health, Education, and Welfare, with the Subcommittee on Mental Hygiene and officers of the Medical Society of the State of New York, with the Subcommittee on Child Welfare, the newly appointed Subcommittee on Rheumatic Fever, officers of the Medical Society of the State of New York, and representatives of the State Department of Health

Postgraduate Education —Postgraduate instruction has been completed in the following counties Chenango, Onondaga, Otsego, Ulster, and Wayne

Postgraduate instruction is being given in the following counties Clinton, Jefferson, Nassau, Ontario, Richmond, St. Lawrence, and Schenectady. Arrangements for postgraduate instruction are being completed for the Suffolk County Medical Society to be given in the near future

Dr Post, member of the Committee, was present

and made the following report

Subcommittee on Mental Hygiene—"The Subcommittee on Mental Hygiene held a meeting January 14, 1948, at the Society's office They are contemplating bringing out a severe criticism of the present conduct of the State in its care of the mentally disabled The New York Academy of Medicine has issued a report, which probably many of you have seen, and our subcommittee has approved it in principle The report from your subcommittee is being prepared"

Subcommittee on Hard of Hearing and the Deaf—
"The Subcommittee on Hard of Hearing and the Deaf held a meeting January 14, 1948, at the Hotel Roosevelt They are working in very close relationship with the State Department of Health in attempting to establish centers There are four, I believe, in New York City for assisting the deaf in the use of the proper appliances. It seems that the deaf do not know best how to secure a hearing device, and there is a lot of exploitation of them, which this committee is attempting to correct."

Subcommittee on Child Welfare—"The Subcommittee on Child Welfare held a meeting January 14, 1948, at the Hotel Roosevelt in conjunction with the State Department of Health The Baby Book' was discussed and endorsed by the subcommittee This has been prepared and will be distributed by the

State Department of Health"

Subcommittee on Rheumatic Fever—"The Subcommittee on Rheumatic Fever held a meeting January 14, 1948, at the Hotel Roosevelt We are very much interested in the Masonic Fund We are well represented on its advisory board. This money will be devoted largely to research in rheumatic fever and allied conditions"

Study Committee on Geriatrics—Dr Bauer stated that Dr Mitchell would be requested to distribute Dr Monteith's report on geriatrics to the Council before the next meeting because of its length. He urged the Council members to read it carefully before taking action on it

Public Relations —Dr Winslow, chairman, presented the following report

"Mr Anderson and Mr Walsh attended the meeting of the American Medical Association in Cleveland, January 5 to 9

"Copies of '20,000 Years of Service' are scheduled for delivery the week of January 19, and distribution will be made immediately

"An order for 1,000 copies of 'Check and Double

Check' came from the Medical Society of the State of Pennsylvania, and an order for 100 copies from the Association of American Physicians and Surgeons

Inc

In cooperation with Dr Bauer, a letter was prepared and sent to each county medical society president, on the need for county societies to appoint committees on public education with speakers selected to inform the public on social econome, and legislative matters Editorial comment on this letter will appear in the February 1 issue of the Journal.

"Editorial assistance was given the Woman's Auxiliary in connection with the Distaff The mid winter issue was distributed through the facilities of

the Public Relations Bureau

On December 9 Mr Walsh spoke before a joint meeting of the Herkimer County Medical Society and the Woman's Auxiliary on the subject of public

relations

"The following postgraduate sessions, held under suspices of the Committee on Public Health and Education, were covered by releases to the press Clinton, Jefferson Onondaga, Otsego, Richmond Schemetady, and St. Lawrence counties also the Geneva Academy of Medicine and an Industrial Health Teaching Day in Rensselaer County Publication.—Dr. Kosmak reported that the

Publication.—Dr Kosmak reported that the Publication Committee held its regular monthly meeting January 13 1948 Most of the business was of a routine character —A number of letters of criticism of editionals had been received which showed that our editorials are being read. The Committee has developed a now list of medical consultants for the State Journal. Note was taken of the increased costs of publication likewise the diminution in advertising revenue For January 1948, the estimated fall was \$3,000 Various directory matters were discussed pertaining to inclusion of certain institutions and organizations

It was voted to have the Convention issue of the

JOURNAL appear on April 1

Rural Medical Service.—Dr Mellen chairman stated there would be a meeting of the A M A. Committee in Chicago on February 6, 1948.

mittee in Chicago on February 6, 1948.

Liaison with Veterans Administration.—Dr
Anderton reported that the following letter had been

received from Dr Bauckus, the chairman

I have herewith certain information which I respectfully request you to submit to the Council at

its meeting on January 15 1948.

"Dr Ethan Flagg Buller Medical Branch Director of the Veterans Administration for New York State, has written to ask me to meet with him and Dr J C. Harding, Washington, D C of the Veter ans Administration, in New York on Thursday, January 22. The purpose of the meeting as stated by Dr Buller is to discuss fee scales and such other subjects as may be presented. I have accepted this invitation and therefore, feel I need not report per sonally to the Council until after this meeting Therefore, I ask to be excused from the meeting of January 15.

No announcement has been made of the appointment of a new Medical Director by the Veterans Ad-

ministration

As soon as thus is done we shall begin prepara with that official. The Special Veterans Committee of the A M.A. of which I am chair man, is planning also to meet with the new appointee

On December 13, 1947, I met with the presidents of the five metropolitan counties in New York City

These men all expressed dissatisfaction with the trend in the veterans medical care plans and we had considerable discussion as to ways and means of implementing their objections. I think further progress in this direction must also await the new VA Medical Director

'I was informed that as of January 1 1948, the proposed transfer of neuropsychiatry treatment to the Veterans Administration clinic actually took place. The reactions to this limitation remain to be

#00T

"Throughout the State there are still many authorizations allowed for medical care by the private physician chosen by the veteran. However unless the new director adopts a new policy which will also be followed in New York State I think the trend

away from private care will continue

"I should like also to report for the Veterans Liaison Committee that this committee mot on December 11 The findings of this committee very largely supported the present fee schedule We have not discussed this specifically with the Branch Director I shall ruport on this phase of the matter following the meeting with Drs. Butler and Harding on January 22

I shall be very glad to follow the wishes of the Council in furthering a practical program for vet

crans medical care.

Workmen's Compensation —Dr Kaliski director of the Workmen's Compensation Bureau procented the following report for Dr Kenney, chairman who was attending an important meeting in Albany

'On December 15, 1947, an open hearing was held on the minimum Medical Fee Schedule under the Workmen's Compensation Law at 30 Centre Street, New York, Miss Mary Donlon chairman of the Workmen's Compensation Board, presiding

The members of the Committee appointed by Miss Donlon to consider a royssion of the fee schedule consisted of Dr Nathan B Van Etten, Dr W P Anderton Mr Edward W Edwards Mr Martin

Hilfinger and Mr Henry D Sayer

The State Medical Society was represented by the chairman of the Workmens Compensation Committee, Dr. J. Stanley Kenney, and the director of the Workmen's Compensation Bureau, Dr. David J. Kalski. Thore was a fairly large representation

from various parts of the State

At the bearing the chairman announced that the committee had already accepted a number of the suggestions made by the Workman's Compensation Bureau of the Medical Society of the State of New York regarding changes and rovisions in the proposed schedule. Your director introduced a considerable number of additional changes. Representatives of the various county medical societies and special groups were given an opportunity to be heard. It became apparent at the hearing that sufficient time had not been given to the constituent county medical societies to enable them to give full consideration to the proposed fee schedule.

After conforming with the members of the comnittee Miss Donlon gracously extended the period of time to February 1 in which the State Society and the constituent county modical societies or other interested groups would be permitted to make sug

gestions to the Advisory Committee

Your chairman and director brought to the attion of Miss Donlon and her committee the fact that the Council of the Medical Society of the State of New York felt that physicians throughout the state should not be limited to the minimum charges in cases where executives of corporations were in sured under the provisions of Section 54, subdivision 6 A plea was made for a change in the rules or in the Law governing charges for services to executives of corporations

"The chairman of the Advisory Committee asked your director to confer with him on the proposed fee schedule and such conference was held on Monday,

January 12, 1948

"A notice was sent to all county medical societies on December 18, 1947, requesting them to bring the proposed fee schedule to the attention of interested physicians and specialty groups in their counties and to send their suggestions as to fees and other matters concerning medical care to the Bureau for submission to Dr Van Etten It is expected that the Advisory Committee to Miss Donlon will make its report in the near future

"Under date of December 15, 1947, the chairman of the Workmen's Compensation Board announced new rules with respect to ratings of medical examiners on the staff of the Workmen's Compensation Board Physicians employed as medical examiners on the staff of the Workmen's Compensation Board are not permitted to accept compensation cases or to render medical care under the Workmen's Compensation Law All workmen's compensation ratings of the Board's examining physicians stand suspended

and may not be used

"There is established for these physicians a special identifying designation of WCB, effective only during their term of service on the Board staff, which signifies that the physician is a member of the Board's staff of medical examiners and qualified, according to his education and experience in internal medicine, surgery, or other specialty. This designation does not authorize such physician to render medical care under the Workmen's Compensation Law. "An examination in roentgenology for eight can-

didates in diagnostic roentgenology and/or radiation therapy was held on Tuesday, January 13, at the New York University Medical College, First Avenue

and 28th Street, New York City, at 3 PM

"The following examiners participated in these examinations Dr Charles Wadsworth Schwartz, chairman, Dr E Forest Merrill, Dr Henry K Taylor, Dr Charles Gottlieb, Dr Ira Kaplan
"Your chairman in accordance with the action of

"Your charman in accordance with the action of the Council, has written to Dr Frederick MacCurdy, Commissioner of Mental Hygiene, concerning the certification of physicians employed in the State Mental Hospitals under the Workmen's Compensation Law, in accordance with the decision rendered by Attorney General Nathaniel L Goldstein, which was included in the minutes of the last Council meeting

"A meeting of the Joint Council of the Medical Society of the State of New York and the insurance carriers and self-insurers is scheduled for the near

future

"At the last meeting of the Council, it was voted that the State Society use its influence to see that the bill introduced last year by Mr Bewley, Senate Introductory 722,1947, "To amend the Workmen's Compensation Law in relation to the maintenance of medical bureaus by groups of employers, in counties of one hundred thousand population or less,' be opposed, if introduced again

"A communication was received from Dr Charles E Goodell of Jamestown, Chautauqua County, seeking the support of the State Medical Society for such a bill this year Dr Anderton has already notified Dr Goodell of the action taken by the Council dis-

approving this bill

"It has always been the policy of the Bureau and. I believe, of the County Medical Societies and the State Medical Society to act as a unit in workmen's compensation matters for the best interests of the public and of the largest number of physicians This has been our policy throughout the State since 1935, when we proposed a single State-wide fee This was only achieved schedule and obtained it by unity of action and discipline on the part of the county medical societies and physicians of the State The question now arises whether our local county medical societies should introduce and support legislation which is deemed by the Council or the House of Delegates not to be in the interest of the profession and the public. It is the opinion of your committee and of your director that the establishment of em ployers medical bureaus, such as would be permitted by the Bewley Bill, would be an entering wedge for the treatment of compensation claimants by employers and carriers and the first step in the destruction of the principle of free choice of physician by the patient under the Workmen's Compensation Law"

It was voted that Dr E Forest Merrill, who contemplates moving to Rochester, be thanked for his cooperation while acting as a member of the Workmen's Compensation Board Examining Committee

on Roentgenology

Unfinished Business

New York State Institute of Applied Arts and Sciences—The Council, on December 11, 1947, voted to table for a month application from the New York State Institute of Applied Arts and Sciences for nomination of a member of their advisory committee in order to have time to gather some informa

tion about the organization

Dr Andresen stated that he had investigated and found that it was established in 1946 by the Legislature of the State of New York, it is one of five such institutes, established at Binghamton, Buffalo, Ithaca, White Plains, and Brooklyn These are to provide education and training in applied arts, crafts, business, the subprofessions, and technical skills, including related work in arts and sciences. It is approved by the State and by the Board of Regents. He stated it would be wise to have a physician help guide this institute in directing any subprofessional technical medical training they might wish to offer

After discussion, it was voted that the chair appoint Dr Andresen to represent the State Society on the Advisory Board of the New York State Institute of Applied Arts and Sciences in Brooklyn

New Business

Dr Andresen presented the following report made by Dr Brondum, a radiologist, at a meeting of the Kings County Medical Society Committee on Public

Health

"He represented the Public Health Committee and the Brooklyn Roentgen Ray Society at a hearing held, at the request of the Commissioner of Health of the Department of Health, on the value of fluoroscopic shoe machine devices in the fitting of shoes Representatives of the medical profession, as well as representatives of manufacturers and shoe store owners, were present at this hearing. The opinion of the medical group was against the use of such devices because of the large dosage of roentgen units being delivered to the feet of individuals, because of the inadequate protection of the machines for the employees operating them, and because available

MEDICAL NEWS

Fellowships in Public Health Available Through State Department of Health

DR. HERMAN E Hilleboe, New York State
Health Commissioner announces the availabil
ity of fellowships for young physicians interested in
entering public health as a career
are for a portiod of two years or less, dopending upon
the qualifications of the applicant. Both field trainmag and academic training are given during the period

of the fellowship which carries with it a supend of \$3,600 per year. In addition, necessary travel and other expenses are paid, as well as tuition at a school of public health.

Application blanks and further information may be obtained by writing to Dr Franklyn B Amos New York State Department of Health Albany 1

Grants Announced for Mental Health Congress

GRANTS totaling \$50 000 to support the United States contribution to the first International Congress on Mental Health to be held in London next August have been announced by Dr Frank Fremont-Smith, chairman of the executive committee of the International Committee for Mental Hygner, New York City, sponsor of the Congress. The theme of "Mental Health and World Citizenthe

ship will be dealt with at the Congress, which will be attended by an estimated 2 000 psychiatrista, social workers and other social scientists from 46 countries (including 500 from the United States) according to Dr Fremont-Smith who added that it was planned to form a World Federation for Mental Health as a result of the Congress.

Eighty three discussion groups are at work in every part of the United States (with more than 50 groups in other countries) preparing material. Two Central Commissions have been set up in

Two Central Commissions have been set up in New York, he added, one under the chairmanship of Dr Lyman Bryson to collate material on the general theme, while the other under the chairman ship of Dr David M. Love, will report on the effect of war on children.

To carry out the work of the Congress additional

funds will be required

Industrial Health Courses at Columbia University

THE revised and expanded teaching program in inaugurated in the academic year 1947–1948 at the School of Public Health, Columbia University will be continued during the school term which starts in September 1948. Courses of study have been set up to train properly qualified physicians, nurses engineers and chemists for specialized work in industrial medicine.

Physicians may be candidates for the Master of Public Health degree with major emphasis on industrial hygiene or may work for the degree of Master of Science in Industrial Hygiene Graduate muses who have a baccalaureate degree and are otherwise qualified may be accepted as candidates for the Master's degree in Industrial Hygiene. The normal course of study occupies an academic year of eight months and students who have not had adequate practical experience may spend an additional period of from two to four months in field work.

The various curriculs are designed to give the students a broad concept of the field of industrial medicine. The courses include general background in industrial medicine, occupational diseases and toxicology industrial medical organization and

administration, lectures, demonstrations and practice in engineering and laboratory methods as well as appropriate field work.

appropriate field work.

To round out the teaching program, courses are given in biotatistics epidemiology sanitation, public health practice personnel management, public speaking, professional writing, health oducation and nutrition.

A feature of the work at Columbia is a weekly seminar in which physicians nurses, engineers and chemists meet together

In addition to the full-time curricula outlined above opportunities are available to a limited number of part time students, not candidates for a degree who may wish to caroll for individual courses each of which runs for a period of eight weeks, occupying from two to four hours a week. Physicians practicing industrial medicine in the metropolitan New York area should find this possibility particularly attractive.

Prospective students are invited to address in quiries to The Director, Columbia University School of Public Health 600 West 168th Street, New York City 32.

Vitamin May Aid Penicillin as Germ-Killer

TRRADIATED pyrido amine, a modified Vitamin B_6 is being studied for its possible killing action

against typhoid, dysentery, and other gram-negative germ organisms not affected by penicillin The studies are being made by Dr Gregory Schwartzman, of Mount Sinai Hospital, New York, under one of five grants-in-aid totaling \$28,370 announced recently by Dr Robert S Goodhart, scientific director of the National Vitamin Foundation, New York City Dr Schwartzman is also being assisted in his investigations by the Commonwealth Fund

Receiving the second largest grant from the

Foundation, Drs L J Goldwater and M E Shils, Columbia University School of Public Health, are studying the effect of pantothenic acid, member of the Vitamin B complex, on counteracting occupational poisoning

Other recipients in this State of the Foundation's grants-in-aid and their investigative projects are Dr Theodore W Oppel, the New York Hospital, \$6,100, for studies on biotin metabolism in man

Six thousand, five hundred dollars to Dr Elaine P Ralli, New York University, College of Medicine, for studies on the relation of pantothenic acid to the functions of the adrenal cortex

Research Grants and Fellowships Announced

R ESEARCH grants to three medical research institutions were renewed recently by Schering Two of the Corporation, Bloomfield, New Jersey grants provide for the appointment of fellows in endocrinology at Jefferson Medical College and the University of Oregon Medical School, and the third grant, for continued study on the enzyme hyaluronidase, has been awarded to Dr Charles Birnberg of the Jewish Hospital of Brooklyn

An endowed fellowship fund for medical research, honoring the late Philip A. Benson, has been established at the Long Island College of Medicine. Income from the fellowship of \$34,200 will be awarded on an annual basis, and will defray, in part, compensation of a man or woman selected to do investigative work in one of the College's basic science or clinical departments For many years president of the Dime Savings Bank, Mr Benson also served as a trustee of the College of Medicine for twelve years and as chairman of its finance committee

\$5,000 Donated for Epilepsy Research

A GRATEFUL father, whose epileptic son regained his health through use of newly developed drugs, has contributed \$5,000 for further research on the disease at the College of Physicians and Surgeons of Columbia University

Dr J C Price, a research associate in the Neurological Institute, where the research is conducted, said that the son figured in the initial studies that led to the development of a standard treatment of epilepsy

It is essentially, Dr Price stated, a study of new medicines that tend to control seizures, integrated into a program that enhances socio-economic reclamation of the epileptic person

MEETINGS

PAST

New York Tuberculosis and Health Association

Dr Kendall Emerson was elected president of the New York Tuberculosis and Health Association at the annual meeting January 27 in New York City Re-elected vice-presidents were Drs Edward P Eglee and Oswald R. Jones

Two new members were elected to the board of directors—Dr Norman Plummer, medical director of the New York Telephone Company, and Dr William Hunter Stearns, instructor in medicine, College of Physicians and Surgeons, Columbia

University

New York City Welfare Council

Ninety-seven of every 200 older persons admitted to mental hospitals die in the first year of hospitaliza-tion, Dr Bernard Wortis, director of the psychiatric division of Bellevue Hospital, told the meeting of the New York City Welfare Council's Conference Group on Welfare of the Aged, on January 29

Saranac Lake Medical Society

Dr D M Brumfiel was the guest speaker at the meeting of the Saranac Lake Medical Society held February 4 at the Saranac Laboratory His topic was "Incommoda Cordis Apud Incolas Eius Loci Sacpe Inventa."

Society of Medical Jurisprudence

"Artificial Insemination from Donor in Cases of Incurable Male Sterility" was the topic of a talk given by Dr Marie Pichel Warner, gynecologist and obstetrician Beth David Hospital at the meet-

ing of the Society of Medical Jurisprudence February

9 in New York City
Dr Robert S Hotchkiss, associate professor of clinical surgery Cornell University Medical School was in charge of the discussion legal aspects of the subject were presented by Mr Sidney B Schatkin assistant corporation counsel City of New York, and psychiatric aspects by Dr Sarah R. Kelman, associate neurologist and psychiatrist, New York Post-Graduato Medical School

FUTURE

Niagara Falls Academy of Medicine

The Niagara Falls Academy of Medicine will hold its annual Clinical Day on March 6 in Ningara Falls.

The program for the day includes the follow ing speakers and topics Dr George Crile "The Present Status of Propyl Thiouradi and Surgery in the Treatment of Hyperthyroidism Dr William Bates, professor of surgory, Postgraduato School of Medicine, University of Pennsylvania, The Simulation of Thoracic and Abdommal Viscoria Pathology by Sogmental Neuralgia, and Dr Foster Kennedy The Allergio Influence in Management

Dr Maurice Chideckel will be guest speaker at

the evening banquet.

New York Diabetes Association

With Dr Herman O Mosenthal as presiding officer an open meeting of the New York Diabetes Association will be held March 19 at 8 30 PM. at Hosack Hall New York Academy of Medicine. Feature of the program will be a review of studies on blood sugar by Dr Edward T Waters, associate professor, department of physiology University of Toronto Discussants will include Dr Frederick M Allen, professor of diseases of metabolum, New York Polyclinic Medical School and Hospital Dr Edward S. Dillon president of the American Diabetes Association Dr Thomas H McGavack, professor of clinical medicine, New York Medical College and Dr Charles H Best director de-partment of physiology University of Toronto

PERSONALITIES

Celebrated

Dr Grosvenor S Farmer Watertown, who was 98 years old on January 6 now retired from active medical practice known as dean of the North Country's medical fraternity and the oldest living graduate of St Lawrence University graduated in 1871 and from New York Homeopathic College in 1874 practiced in Gouverneur and in Watertown.

Honored

HOSPITAL NEWS

Roosevelt Hospital Conforms to Council's Master Plan

THE Hospital Council of Greater New York has begun the implementation of its Master Plan and has designated Roose elt Hospital as a "participating hospital" in the Plan, it was announced in February in the Council's Bulletin The Master Plan is defined by the Council as a flevible guide for the integration and development of hospital and health facilities in relation to the needs of the people

Reviewing the plans of hospitals conforming to the basic principles of the Master Plan, the Bulletin said, "it is fitting that Roosevelt Hospital be selected" By the terms of the will of James H Roosevelt, signed in 1854, "the hospital was incorporated through the cooperative efforts of individuals with responsibilities in the fields of medical education and hospitals. Under this cooperative atmosphere the cornerstone of Roosevelt Hospital was laid in 1869"

The review of the plans and program of Roosevelt Hospital, on which the Council's designation was based, revealed that the hospital plans replacement facilities for the reception and emergency departments, and also for the outpatient department. In addition, the hospital plans for the establishment of facilities for a maternity service, which the Council has stressed in its reports as necessary in every general hospital.

Roosevelt Hospital, it was stated, has at present 410 beds, of which 230 are for ward patients, 93 are for private, and 87 for semiprivate patients. An approved school for nursing also is located on the

site

Extensive rehabilitation of facilities has been in progress during the past eight years. The size of the hospital, the report added, will not exceed 600 beds

Hospital Diets Subject for Institutes

THE TWO institutes on hospital dietary departments scheduled for April by the American Hospital Association will be held in Buck Hill Falls, Pennsylvania, April 19 to 23, and in Kansas City, Missouri, April 12 and 13

Emphasizing the place of the dietary department in the total hospital service offered to the community, both institutes are designed to help administrators work closely with their dietitians in establishing sound and efficient departmental organization with resultant attractive, well-planned patient meals

The five-day institute at the Buck Hill Falls Inn

in Pennsylvania, "Modernization of Food Service Facilities and Procedures in Hospitals," will cover three important phases of dietary administration good personnel organization and training, modernization of facilities and layout and departmental controls and costs, and the educational responsibilities of the hospital An open forum is planned on hospital in-service training of the dietitian

on hospital in-service training of the dictitian

This institute is sponsored by the Hospital
Council of Philadelphia, Hospital Association of
New York State, Greater New York Dictetic Association, Philadelphia Dictetic Association, and

Teachers College, Columbia University

Roswell Park Memorial Institute Makes Policy Changes

PATIENTS suffering from beingn hemangiomata will no longer be accepted at Roswell Park Memorial Institute in Buffalo, according to a recent announcement by Dr Louis C Kress, Institute director

The change in policy was inaugurated, Dr Kress said, because such patients no longer present a diagnostic or research problem and can be treated by practicing physicians and dermatologists throughout the state

Approximately one fifth of the case load of the dermatologic department of the Institute consists of benign hemangiomata, which are not malignant, but require time which might be devoted to patients with cancer, according to Dr Kress

NEWS NOTES

The first cancer-prevention clinic devoted exclusively to teen-agers was opened in February at the Kate Depew Strang Prevention Clinic, a division of Memorial Hospital Center for Cancer and Allied Diseases, New York City The clinic will be an

extension of one which was opened a year ago for children up to fourteen years of age

Dr Selman Waksman, discoverer of strepto-

mycin and professor of antiblotics Rutgers University, began a series of forums in the auditorium of Jewish Sanitanum and Hospital for Chronic Diseases, Brooklyn on February 4. His subject was 'The Past Present and Future of Antibiotics.''

Dr Paul Lussheimer spoke on "The Neurotic Personality of Our Time at a meeting of the Brooklyn State Hospital Psychiatric Forum on February 5

The Children's Aid Society, New York City consumed recently that it had ninety two beds available for children recovering from rheumatic fover and that in the last two years 578 children were cared for at the society's Elizabeth Milbank Anderson Home for Convalescent Children Chappagua, and the Milbank and Martha Homes for Convalescent Boya, Valhalla. The society accepts rheumatic fever and general convalescent children the recommendation of doctors visiting nurses, hospital social service departments and other social agencies

Dr William P Longmire Jr associate professor of surgery at Johns Hopkins Hospital Baltimore delivered the 1948 William Linder Vlemorial Lecture of the Jewish Hospital of Brooklyn, February 11 His topic was "Recent Advances in Chest Surgery"

In line with the policy of continued education for doctors the medical staff of Wychoff Heights Hospital Brooklyn, on January 13 heard lectures by two members of the department of chemistry and physics of St. John's University Professors Harold A. Horan and Ernest G Theroux. Their topic was 'Recent Developments in Chemistry and Physics'in Relation to Hospital Practices

A health program for Chenango County has been proposed by Dr. Ralph M. Vincent, district state beath officer to the county Board of Supervisors Prepared by the New York State Department of Health and the Joint Hospital Survey and Planning Commission, the health prospectus would provide for a unified county health department, for the expansion of a public health laboratory to be located in the Chenango Momorial Hospital in Normich for additional 70 hospital bods and a chronic unit of 63 beds, expanding the hospital to 130 beds establishment of two state-aided public health centers

and the eventual construction of a new 50-bed hospital in the southern part of the county

Dr Harold G Wolff associate professor of medicine and psychiatry at Cornell University Medical Collego, spoke on 'Protective Reaction Patterns in Man Involving the Organs of Alimenta tion as the first Isidoro W Held Lecture at the Beth Israel Hospital on February 25

Twelve Queens hospitals were among the 3 143 institutions that have been approved by the American College of Surgeons in its thirtich annual standardization, it was announced recently in Chicago. They are Flushing Hospital and Dispensary Flushing, Illislide Hospital Bellerose, St. Joseph s, Far Rockaway Jamaica, Mary Immaoulate Queens General and Triboro all in Jamaica. St. John s. Long Island City, Creed more State Hospital Queens Villago, Rockaway Beach Hospital and Dispensary. U. S. Naval Hospital St. Albans and St. Anthony's, Wood haven

Western New York's first complete unit for the care of premature bables was opened recently at Children's Hospital Buffalo The unit, furnished with the latest equipment and staffed with especially trained personnel has a capacity of 22 beds and is divided into four nurseries and autility room. The unit will be invaluable also as a training center for doctors nurses, and hospital administrators and will provide a basis for the study of the cause of promature birth, according to Dr Mitchell I Rubin, Children's Hospital pediatriclan. The new wing is a gift of 'a friend of the hospital who has long realized the need in this area for such specialized care.

Brunswick Hospital and Home Amityville has been converted into a general hospital according to a recent announcement from the hospital's new owners.

The hospitals will be open to all doctors in the vicinity of Nassau and Suffolk counties who are in good ethical standing, the owners said. The new directors of the hospital are Dr Hyman B Hendler and Dr Bon M Stein, of Hempstead Dr Jack M. Lesnow and Dr Charles J Preefer, Rockville Centre and Dr Sidney S Hein Garden City Dr Convas L. Markham, who has been superintendent of Brunswick Hospital since 1910 is remaining in that capacity

A meeting of the convention committee was held

December 1 in Brooklyn.

Scottish Newspaper Tells Story of Auxiliary Gift

FEATURED in the December 21 1947 issue of The Sunday Post, tabloid newspaper published in Glasgow, Scotland is a two-column story telling of candy and goodies supplied children of Oban Scotland as a result of the gift of money made by the Woman a Auxiliary at the annual convention in Buffalo last May

With the headline, "These Doctors Wives Could Scarcely Believe Their Eyes!—They Saw Our Daily Ration and They Acted' the newspaper story reports the talk given by Mrs. Alan E Cameron, of Oban on "A Housewife Looks at Postwar Britain at the 104 annual convention. Describing how the housewives of Scotland were living. Mrs. Cameron gave a graphic portrayal of the limited food supplies showing the Auxiliary members a tray with the small amounts which make up an individual s daily food ration in Scotland.

According to The Sunday Post Until then, these American women had no conception of how we were living, asys Mrs. Cameron. They had a vague idea that if we were not getting much meat we must be dreadfully sick of eating chicken! They did not appreciate that when we are short we are practically without!

They were particularly impressed by the fact that little children had so few sweets So at their meeting the following day the delegates voted funds and added personal contributions to be given to Mrs Cameron to provide a treat for the kiddles in recognition of the very real sympathy aroused among members of the organization.

Mrs. Cameron completed arrangements for the candy to be forwarded, and it was distributed among the four Oban schools prior to the Christmas

holidaya.

COUNTY NEWS

Albany County

Members of the Albany County Woman's Auxiliary were active during the Christmas season when they aided in the annual Christmas seasons when they aided in the annual Christmas seasons are a Christmas party at the Albany Hospital for incurables at which gifts and refreshments were distributed, and were in charge for one day of the sale of articles made by the blind.

At their December meeting, somiannual reports of the officers and committee chairmen were pre-

mented.

On February 25 the group sponsored a legislative dinner meeting at the Hotel Wellington,

Albany with Mrs William McThomson, county prosident, in charge. Dr Robert Hannon, legis-lative chairman for the Medical Society of the State of New York, spoke, and guests included Mrs Harry F Pohlmann State Auxiliary president Mrs. Edgar Noptune president-elect of the State Auxiliary and Mrs. Alfred P Grussner State legislative chairman.

In March, the Albany County Auxiliary is spon soring a solver tea for the benefit of the Red Cross. to be held at the home of Mrs. Emerson Crosby Kelly

In April the group will celebrate its tenth an niversary as an organization,

Allegany County

Dr D H McMann, Hornell, district health officer, spoke to members of the Allegany County Woman's Auxiliary when the group met in November The president, Mrs John F Glosser, Wellsville, reports that the unit is contributing to the Physicians' Home and is interested in the Angelica County Home

Meeting on January 8 at the Wellsville Country Club, the group discussed the Wagner-Murray-Dingell Bill and read and discussed Dr Haven Emerson's "Ten Point Plan," which was sent to all

newpapers in Allegany County

On March 11, the Auxliary has been invited to have dinner with the Allegany County Medical Society at Belmont, when Dr Louis Kress, director of the Roswell Park Memorial Institute and charman of the executive committee of the New York State Cancer Society, will speak to both groups The technicolor film on cancer, "The Traitor Within," will also be shown

Through the efforts of Dr and Mrs Edward Briggs, a cancer picture was shown to the Rotary

Club of Wellsville

In September, the Auxliary went on record as unanimously in favor of the county health unit Although the plan was defeated on February 3, the members have announced that they will continue to work for the county health program

Mrs Edward Comstock, chairman of the "shutins" committee, has reported that the Tuberculosis Association will work with the Auxiliary on the project of collecting and selling articles made by the

"shut-ins"

Cattaraugus County

Carrying out the plan to work with the county Parent-Teacher Associations in presenting information on rheumatic fever and heart disease, Mrs Maurice G Sheldon, Olean, Auxiliary president, during January attended five meetings in the county Accompanying her were Mrs Ronald F Garvey and Mrs N P Johnson, both of Olean, members of the committee

Mrs Sheldon reports that the P-T A.'s have done an excellent job in getting a large attendance at each meeting, for which Mrs Sheldon appoints a local doctor's wife as chairman. The County Health Department has loaned a screen and projector, and, so far, over 900 have seen the film and recording, "Jimmie Beats Rheumatic Fever." More meetings are planned for the spring

Radio time at the local station has been arranged, with recordings supplied by the American Medical Association, and a fraternal order in Olean has adopted the project of raising funds for research on

rheumatic fever

On February 12, members of the Auxiliary and the County Medical Society held a joint meeting in Olean to hear Dr. Herbert H. Bauckus, Buffalo, speak on socialized medicine, and Mr. Thomas E. Walsh, field representative of the State Society's Public Relations Bureau, speak on the chiropractic bill.

Chenango County

Chenango County Woman's Auxiliary was organized by Mrs Herman W Galster, Scotia, state organization chairman, at a meeting December 11 in Norwich. Officers elected were Mrs John C Lee, Norwich, president, Mrs James M Flanagan, Norwich, vice-president, Mrs 8 M

Nichter, New Berlin, secretary, and Mrs W D

Mayhew, Oxford, treasurer

Present to assist in the formation of the new group were Mrs Harry F Pohlmann, Middletown, State president, Mrs Edgar M Neptune, Syracuse, State president-elect, Mrs M M Monserrate, Binghamton, sixth district councillor, and Mrs John J Buettner, Syracuse, president of the Onondaga County Woman's Auxiliary

Clinton County

Elected as Clinton County Auxiliary's first officers are Mrs Edwin Sartwell, Peru, president, Mrs Andrew Z Speare, Chazy, vice-president, Mrs Franklin Atwater, Plattsburg, secretary, and Mrs George Temple, Keesville, treasurer

At the next meeting, Mrs Sartwell will appoint committees, and the group will plan future activi-

ties

Columbia County

Mrs Harry F Pohlmann, State Auxiliary president, was guest speaker at the luncheon meeting of the Columbia County Auxiliary, held February 24 in Hudson. Presiding was Mrs Ralph F Spencer, Claverack, county president

Dutchess County

Self-education is Dutchess County Auxiliary's theme for the year The president, Mrs Archibald W Thomson, Poughkeepsie, with the guidance of Mrs J Emerson Noll, Port Jervis, second district councillor, is making plans for the unit

Erie County

A Christmas tea was held December 16 in honor of the Erie County Auxiliary's 43 new members and several prospective members

A study group has been organized and held its first meeting January 12 in Buffalo, under the leadership of Mrs Thomas F Houston, legislation chairman Mrs Arthur L Bennett, Buffalo, is Erie president

Fulton County

Main project of the Fulton County Auxiliary is to collect medical and surgical supplies to be sent to the center in New York City, where they will be shipped overseas for the relief of needy countries, in accordance with the plan sponsored by Admiral William Halsey

The January meeting was held at the home of Mrs Robert Kunkle in Gloversville, with Mrs Harry F Pohlmann, State president, as guest speaker Describing the activities of other auxiliary units, Mrs Pohlmann gave suggestions for further projects and asked for aid for the Physicians' Home

For the February meeting, at the home of Mrs Arthur Wilsey, Gloversville, election of officers and

a revision of the constitution was planned

Greene County

District Councillor Mrs Albert Vander Veer, Albany, spoke on "Legislation" at the meeting of the Green County Woman's Auxiliary, held February 24 at the Catskill Country Club, Catskill

Kings County

Dr Milton J Senn, child psychiatrist, Cornell University Medical School, spoke at the January meeting of the Kings County Auxiliary, held following a buffet lucheon

Gentlemen

This is to notify you that the Board of Regents at a meeting held November 21, 1947,

VOTED, That the determination of the Medical Committee on Grievances, in the matter of the application for the revocation of the medical license heretofore granted to Boris Schleifer, Brooklyn, be accepted and sustained, that, in compliance with the recommendation of said committee, medical license No 18479, issued under date of June 26, 1924, to said Boris Schleifer, permitting him to practice medicine in the State of New York, be revoked, annulled and canceled, and that his registration or registrations as a physician, wherever they may appear, be ordered annulled and canceled of record, and that the Commissioner of Education be empowered and directed to execute, for and on behalf of the Board of Regents, all orders necessary to accept the determination of said Committee on Grievances and to carry out the terms of this vote

Dr Schleifer was registered for the years 1947-1948 from 2001 Strauss Street, Brooklyn, New York The order of the Commissioner was served on Dr Schleifer on December 3, 1947, and his medical heense is revoked as of that date

JACOB L LOCHNER, JR., M D , Secretary NY State Board of Medical Examiners January 6 1948

Woman's Auxiliary

[Continued from page 548]

On February 29, a benefit cocktail party for the Physicians' Home was held, with Mrs D A Ajello, Mrs Vincent Teseriero, and Mrs Richard Walsh acting as hostesses

Celebrating the thirteenth birthday of the Auxillary, a luncheon will be held March 9 at the Gramercy Park Hotel, New York City, in honor of Mrs John L Bauer, founder and first president of the group, who will receive a scroll signed by the charter members, and the title of Honorary President for life Guests who have been invited include Mrs Harry F Pohlmann, Mrs Luther Kice, and Mrs Edgar M Neptune, State officials, Mrs Daniel Swan, Queens County, Mrs Myron Hafer, Suffolk County, and Mrs William G Miller, Nassau County

On April 13, the annual meeting and election of officers will be held Mrs Charles E Scofield is

president-elect

Onondaga County

Featuring, in the Christmas spirit, plans for giving summer camperships, the Opendaga County

Auxiliary, of which Mrs John J Buettner, Syracuse, is president, held its annual holiday lucheon in December in Syracuse Carrying out their annual custom, 80 members brought gifts and money to be distributed by the Christmas Bureau, a clearing-

house for giving to needy families

Guests at the meeting were Mrs Harry F
Pohlmann, State president, and Mr Paul K.
Weinandy, director of Huntington Club Settlement House, who thanked the group for the 7 two-week camperships the Auxiliary gave last year

Queens County

The first 1948 executive board meeting of the Queens County Auxiliary was held January 20 at the home of the new president, Mrs Daniel J Swan The guest speaker, Dr Alfred Angrist, president of the Queens County Medical Society, urged the group to continue its support of the Queens County

Medical Library
Mrs Adrian Donnelly, Flushing, membership
chairman, has announced that the 15th anniversary of the Auxiliary will be celebrated at a tea on March

16 to which all doctors' wives are invited.

guard against kidney damage

In Sulfadiazine with Sodium Lactate-MRT the physician may be sure that the principle dangers of sulfon amide therapy—crystalluria and urolithiasis—are absolutely minimized

Sulfadiazine with Sodium Lactate-MRT raises the pH of the urine to increase the solubility of the excreted sulfonamide and its conjugates Prevention of crystal formation is insured.

Pleasant taste assures maximum patient cooperation in both adults and children

One teaspoonful (5 cc.) of Sulfadiarine with Sodium Lactate-MRT contains 7.7 grains (0.5 cm.) of sulfadiarine—the amount contained in the 0.5 cm. tablet plus sodium lactate in a full 3 to 1 ratio

Minutes of the Council

[Continued from page 540]

orthopedic opinion was against the usage, feeling that the machines were of no particular value. The manufacturers contended that the dosage was not excessive, and there was adequate protection because the employees have been trained in their use. The lawyers countered with the widespread use of dental x-ray machines but were told that in dental x-ray one assumes that there is sufficient indication to warrant its use but not so in the fitting of shoes. The dangers to physicians and patients as a result of exposure to x-rays in an uncontrolled manner was stressed by the medical representatives.

"Dr Brondum felt that such use of fluoroscopic machines may lead to the promiscuous use of these machines for fingers, lungs, etc, and he spoke of the long-term dangers to the employees who are using large amounts of x-ray and radium in industry, and of the problem of disposal in hospitals using large

amounts of radioactive materials He offered the following motion, which was approved

"It is suggested that the Public Health Committee consider the installation of a Subcommittee on Radiologic Safety, whose function it would be to give advice, to correct such abuses of radioactive materials, and to act as an educational group to the medical profession as to the dangers to which the public are being subjected ""

Dr Andresen thought we should have a similar

Dr Andresen thought we should have a similar subcommittee of our State Public Health and Education Committee

After discussion, it was voted to refer this report to the Public Health and Education Committee subject to the judgment of Dr Mitchell as to its disposition, and whether or not to have a special subcommittee for consideration of problems relating to radioactivity and atomic energy

If You Are Reading a Paper at the 1948 Annual Meeting

the New York State Journal of MEDICINE will appreciate your following the suggestions listed below in the preparation of your manuscripts Since the Annual Meeting papers are submitted to the Journal for publication, your cooperation in heeding these suggestions will save correspondence, avoid the return of scientific papers for revisions, minimize the work of preparation for the printer, and save the high costs of corrections made on the galley proofs

Size of Articles -It is earnestly desired that scientific articles shall not exceed 6 Journal pages Longer articles tend to lower reader at the outside An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e g, twelve manuscript pages will make five Journal pages

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins. They should be prepared with great care so as to be typographically correct All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin This is imperative for rapid and accurate composition by the printers

Titles —The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated

Subheadings —Subheadings should be inserted by the author at appropriate intervals

References —It is the unfailing practice of the New York State Journal of Medicine to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference —A list, consecutively numbered, of these references should follow at the end of the manuscript. (Note that spelling in list is some as in manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed , Philadelphia, Lea & Febiger, 1927, vol 5, p 57

Periodicals—author's surname followed by initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

Note The Journal does not include titles of articles

Case Reports —Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables —While tables are very useful on lantern slides in the reading of papers, they fail of this pur-pose to a large extent in the printed page—For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than $12 \times$ 16 mches, and must be made with jet black India mk on white paper Do not use typewriter for letterink on white paper Do not use typewriter for tettering. The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch. If finer ruled paper is used, the major division lines have the description of the state should be drawn in with black ink, omitting the finer In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable Mail rolled or flat, never fold after reduction Photographs should be very distinct and show clear black and white contrasts They must be on glossy white paper Avoid round and oval photographs. Whenever possible "crop" photographs, i e, mark portion that can be excluded when reproduced

Crop marks should be on margin of photographs Do not run pencil lines through photographs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

Experience is the Best Teacher

It's true in medicine-

John William Ballantyne

(1861 1923)

proved it in obstetrics

BALLANTYNE, in his early studies of anatomical and pathological conditions found in the new born, sensed the value of routine prenatal care in obstetrics. As a pioneer for prenatal care he was the first to establish a clinic for the expectant mother World wide acceptance of Ballantyne's concepts quickly followed his successful experiences in prenatal supervision

Experience is the best teacher in choosing a cigarette, too!

MORE PEOPLE ARE SMOKING CAMELS THAN EVER BEFORE!

Yes, experience is the best teacher in choosing a cigarette. Millions of smokers who have tried and compared different brands have found that Camels suit them best. As a result, more and more people are smoking Camels as the 'choice of experience."

Try Camels. See if your own taste doesn't appreciate the rich, full flavor of Camels See if your own throat doesn't welcome Camel's cool mildness.

Let your own experience tell you why more people are smoking Camels than ever before.

According to a Nationwide surrey:

More Doctors Smoke CAMELS than any other cigarette

When 113.597 dectors from court to court in arrest field of medicine where asked he should be should be

PRECISION BUILT by Expert Craftsmen

The knee-joint crosssection shows that Hanger Artificial Limbs are not complicated mechanisms,

not loosely-fitted pieces, but a few expertly-machined parts carefully assembled by experts. The simple construction making possible the efficient operation of Hanger Limbs is the result of long study and research. It is dependent on precision-made parts properly assembled. Hanger craftsmen are carefully selected and trained for this important work. Each Hanger Limb therefore conforms to specifications developed by years of experience.

ONLY BELLERGAL PROVIDES ALL THREE

- 1. SYMPATHETIC INHIBITION with ergotamine tartrate
- 2. PARASYMPATHETIC INHIBITION with Bellafoline.
- 3. CENTRAL SEDATION with phenobarbital.

Originality • Elegance • Perfection

FOR FUNCTIONAL DISORDERS

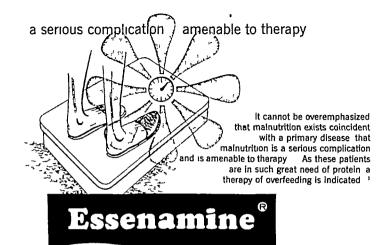

Patients with psychosomatic disorders suffer somatic distress just as much as those with organic disease

For these patients **Bellergal** provides an effective combination of drugs acting on both divisions of the autonomic nervous system as well as on the central nervous system

Use **Bellergal** in the treatment of gastrointestinal neuroses and other functional disorders

Bellergal*

SANDOZ PHARMACEUTICALS Division of SANDOZ CHEMICAL WORKS, INC. 68-72 CHARLTON STREET, NEW YORK 14, N Y

Palatable Easily Assimilated Protein Concentrate

for Oral Use

Success with Essenamine—as the principal ingredient of a high protein diet—is probably due to four factors

- 1 High concentration of proteins
- 2 High content of essential amino acids that is high biologic value
 - 3 Lack of any pronounced taste so that it can be incorporated in large quantities in other foods that have a pleasant taste
- 4 Limited solubility (which) apparently minimized the concentration of amino acids in the small intestine at any one time so that the sense of fulness was postponed and the tendency to diarrhea did not occur?

Essenamine is supplied in 7½ and 14 oz wide mouth jars

Attractive Essenamine Recipe Book sent on request.

Specify number of copies wanted.

Increasing recommendation for

gold therapy
in active rheumatoid
arthritis

TO QUOTE FROM RECENT AUTHORITATIVE SOURCES:

" we have not found any therapy other than gold therapy which will consistently and in a high percentage of cases change the course of the disease."

"Gold therapy at present seems to be the only drug which shows promise of checking the activity of rheumatoid arthritis,"

REDUCED TOXICITY

"The high incidence of reactions attributable to the formerly employed larger doses has been largely obviated by the use of more conservative doses" Moreover "therapeutic results are quite as good with smaller doses."

GOLD SODIUM THIOSULFATE

with SODIUM THIOSULFATE and BENZYL ALCOHOL 2% (Searle) Supplied in 5 cc. (50 mg.) serum type ampuls, packages of 6, 25 and 100

CAUTION
Gold Sodium Thiosattate
must be used with extreme
carton, especially in the
presence of luberculosis
and diseases of the
forer and kidneys.

DISTINCTIVE

ESTINYL* (ethinyl estradiol) is distinctive among oral estrogens

Ethinyl estradiol is a derivative of the true follicular hormone, alpha-estradiol It is more potent, milligram for milligram, than any other oral estrogen, natural or synthetic, in clinical use today

It induces that therapeutically important "sense of well being" characteristic of the natural estrogens. Its cost is low, making it available to all women

It offers the convenience of estrogen therapy by mouth, and provides relief with a rapidity almost equal to parenteral hormone treatment

ESTINYI

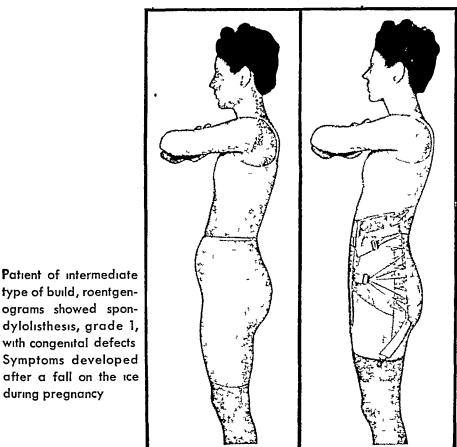

(ethinyl estradiol)

DOSAGE: One ESTINYL Tablet of 0.05 mg daily In severe cases two to three tablets may be prescribed daily and desage reduced as symptoms are alleviated.

ESTINYL (ethinyl estradiol) Tablets of 0 05 mg (pink) and 0 02 mg. (buff) in bottles of 100 250 and 1,000 ESTINYL Liquid, 0.03 mg. per 4 cc., in bottles of 4 and 16 oz.

Scherung CORPORATION BLOOMFIELD N J

Aid in conservative treatment when the fifth lumbar vertebra slips on the sacrum

Same patient after application of support Patient reported relief from pain which was confined to the back and called attention to the ease and comfort in the wearing of the support

type of build, roentgenograms showed spondylolisthesis, grade 1, with congenital defects Symptoms developed after a fall on the ice during pregnancy

advantages of the CAMP lumbosacral support

THE WELL BONED BACK—Curves in and under the gluteal muscles, relieving the tension of these muscles on their attachments

Wide shaped piece of material at top (fastening in front) holds the support still more closely about the lumbar spine

... THE SLIDE LACING ADJUSTMENT — Assists in steadying the pelvic girdle.

It also allows for reinforcing with aluminum steels or Camp Spinal Brace

The elastic releases make for comfort.

We Share with You the Care of Your Patient

Here at the Spa, the care of your patient conforms to a medical guidance which you, yourself, have initiated

Capable physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Surrounded by modern facilities for his treatment, your patient receives the benefit of your continuing medical direction in the care of circulatory and rheumatic disorders of a chronic nature

In peace and quiet, a sick person achieves the mental and physical relaxation that gives full scope to the restorative powers of the Spa's famed waters

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative cure at the Spa, you, too, will return to your practice refreshed—revitalized—ready for the busy days that he ahead

For professional publications of the Spa, and physician's sample carton of bottled waters, with their analyses, write W S McClellan, M D, Medical Director, Saratoga Spa, 155 Saratoga Springs, New York

Listed by the Committee on American Health Resorts of the American Medical Association

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

Introducing a NEW ganglionic blocking agent for peripheral vascular disease

ETAMON CHLORIDE

EBECTING A BARBIER against vasoconstrictor impulses ETAMON CHLORIDE permits an increased blood supply to affected limbs. By temporarily blocking the transmission of efferent impulses through autonomic ganglia, the sympathetic stimuli causing vessel spasm are interrupted. Thus, reduced blood flow due to abnormal reduction in caliber of peripheral vessels is combated.

ETAMON CHLORIDE is indicated in the treatment of

Thromboangiitis obliterans (Buerger's disease)

Peripheral arteriosclerosis obliterans

Thrombophlebitis—relief of associated vasospasm

Causalgia or reflex sympathetic dystrophy

Functional vascular disorders; Raynaud's phenomenon, acrocyanosis, livedo reticularis

S A DIACNOSTIC AID

Peripheral vascular disease—selection of cases for sympathectomy

Administration: Intravenously or intramuscularly The uses and dosage of ETAMON are dependent upon the physiologic rather than the chronologic age of the patient. Descriptive literature on request.

Packaging: ETAMON CHLORIDE (tetraethylammonium chloride, P D & Co.) is supplied in 20-cc. multiple-dose STERI VIALS® (rubber-diaphragm-capped vials) each cc. of solution containing 0.1 Gm of ETAMON CHLORIDE

S C A W

"...there are no standards which apply to all foods;

...there are no standards which apply to all individuals."

F L ADAIR J A M A 128:344, 1945

To help meet the differing nutritional needs seen from day-to-day, and from patient-to-patient, the following mixed-vitamin preparations are recommended

For the sick patient

THERAPEUTIC FORMULA SQUIBB

VITAMIN CAPSULES

because "of patients hospitalized for all reasons, two-thirds are afflicted with malnutrition", and because "it is necessary to repair or rebuild these inroads in the nutritive system", if the patient is to be restored to health and strength

Squibb Therapeutic Formula provides truly therapeutic dosages of all the vitamins known to be essential for human nutrition

Or, also for the sick

BASIC FORMULA SQUIBB

VITAMIN TABLETS

because "severe deficiencies of the water-soluble vitamins are much more common than those of the fat-soluble group

Squibb Basic Formula provides the four critical water-soluble vitamins in *therapeutic dosages* — for cases in which treatment is not to be unduly prolonged and the fat-soluble vitamins may not be indicated

For the well patient

SPECIAL FORMULA SQUIBB

VITAMIN CAPSULES

because "one attack of nutritional disease seems to predispose to recurrences. Consequently, rehabilitation insists upon follow-up studies of the patient to insure his continued wellbeing's

Squibb Special Formula provides maintenance dosages of the known essential vitamins

For therapy in certain macrocytic anemias, so frequently associated with mixed vitamin deficiencies, Squibb Therapeutic Formula, modified with folic acid, is now available. When prescribing folic acid, specify—Squibb Therapeutic Formula Modified.

NOW...a New, Effective ANTIHISTAMINIC of Low Toxicity

Clinical studies have established Neo Antergan Maleate (brand of pyranis amine maleate) as an efficient antihis taminic drug of relatively low toxicity, effective in preventing or relieving symptoms in a high percentage of patients with certain allergic manifestations

Neo Antergan has proved to be most effective in the following conditions URTICARIA HAY FEVER ALLERGIC DRUG REACTIONS VASOMOTOR RHINITIS PRURITUS ATOPIC DERMATTIS AND ANGIONEUROTIC EDEMA

Beneficial results are obtained also in bronchial asthma and eczema, but in a lower percentage of cases Certain cases of migraine, presumably those due to histamine or a histaminelike substance, and some cases of abdominal pain thought to be caused by smooth muscle spasm induced by allergic phenomena, also may be expected to respond in varying degree to treatment with Neo Antergan The action of Neo Antergan is palliative, not curative.

Undesirable reactions are generally mild and transient, although moderately severe side effects have been observed in a relatively small percentage of cases It is rarely necessary to discontinue treatment with Neo Antergan because of toxic reactions

SOLUSALVE

The extensive usage of Hycloromanet under the most adverse conditions—the battle fronts of World War II—has proven it to be a most effective fungicidal agent

The combined day-night treatment—VODUST (Hycloromane with India talc) for daytime use and VODISAN (Hycloromane in Solusalve) for nighttime use—exerts a continuous fungistatic and bacteriostatic action and is safe, non-irritating and noninjurious to the skin.

Your Job— And Ours:

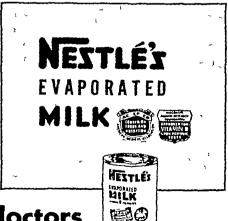

To Fortify Baby's Health

Babies who enjoy the benefit of your professional supervision have added assurance of sound growth and extra protection from infant ills. Proper nutrition, of course, plays a basic role in baby's healthy development, and in this field the use of Nestlé's Evaporated Milk provides the full value of whole cow's milk, plus something extra—pure Vitamin D3

Nestlé's Has the "Know-How" to Produce a Good Product

- For over 80 years, Nestle's milk products have been best known, most used for babies 'round the world
- Nestle's was the first evaporated milk fortified with 400 USP units of genuine Vitamin D₃ per pint
- Nestle's accepts milk only from carefully inspected herds. As further assurance of quality, rigid con trols check Nestlé's Milk every step of the way. We even take the plant apart every day and wash it!

No wonder so many doctors recommend NEXTLE's Milk by

in common urmary tract infections

Mandelamme* therapy affords notably successful results in a high percentage of common urinary tract infections Carroll and Allen † in their recent carefully analyzed study of 200 un selected cases, obtained prompt and effective responses in 74 per cent of the patients.

Mandelamine therapy offers 6 advantages.

- 1. No gastrie upset;
- 2. No fluid regulation,
- 3. No dietary restrictions;
- No supplementary acidification (except when urea-splitting organisms are present)
- 5. Wide range of antibacterial action,
- 6. Simplicity of administration.

MANDELAMINE

Brand of Hexydaline
(Malmenin Mendida)

SUPPLIED: Enteris-coated tablets of 0.25 Gm. (33) grains) each, in packages of 130 tablets senitaped, and in bottles of 500 and 1,000.

The word MANDELAMINE is a registered trademark of Nepera Chemical Co., Inc.

Consistently Zero!

CLINICAL ADVANTAGE IN FEEDING THE PREMATURE

Because Similac, like breast milk, has a consistently zero curd tension, it can be fed in a concentrated high-caloric formula without fear of increased curd tension and lengthened digestive period. Hence, premature infants unable to take a normal volume of food may safely be fed a concentrated Similac formula supplying as much as double the caloric value (per ounce) of the normal dilution. The use of a concentrated formula often avoids serious loss of weight and inaution in the premature infant, and permits a more rapid return to normal weight gain.

M & R DIETETIC LABORATORIES, INC . COLUMBUS 16, OHIO

SIMILAC

Similar to breast milk

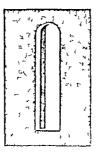

A powdered modified milk product especially prepared for infant feeding made from tuberculin tested cow s milk (caseln modified) from which part of the butter fat has been removed and to which has been added lactose coconnut oil cocon butter corn oil and olive oil Each quart of normal dilution Similao contains approximately 400 U.S.P units of Vitamin D and 2500 U.S.P units of Vitamin A as a result of the addition of fish liver oil concentrates

SEDATION BY SUPPOSITORY

FOR
Asthmatic
Geriatric
Psychotic
Patients

ARBEC

Aminophylline Barbiturate

Compound

SUPPOSITORIES Available in packages of 12 For many patients, injectable medication is unsuit able yet oral sedatives may produce gastric upset or be too slow in taking effect. In such cases, sedation by suppository will often prove the most satisfactory means of treatment. It is also useful as a supplement to other forms of sedative therapy.

The sodium pentobarbital quickly reheves tension and nervousness, and the sodium phenobarbital prolongs the action to assure a restful night of sleep The aminophylline alleviates spasm resulting in a greater effectiveness of the barbiturates even in asthmatic patients. The benzocaine contributes an adequate local anesthetic effect.

DOSE: Adults, and suppository rectally (inserted above the aphineter) at lectime.

Painless, 24-hour penicillin therapy

Therapeutically effective penicillin blood levels for more than twenty-four hours plus virtual elimination of pain at the site of injection are now possible with 'Duracillin, in Oil' (Procaine Penicillin-G in Oil, Lilly) At the end of a twenty-four-hour period, the average blood level produced by 'Duracillin, in Oil,' 15 more than three times that produced by the Romansky formula The anesthetic effect of procaine and the absence of beeswax from the formula of 'Duracillin in Oil,' minimize local discomfort

Directions Administration Shake the vial vigorously to assure uniform suspension, withdraw and administer the dose intramuscularly with a 20-gauge, 1 1/2-inch needle Although the upper outer quadrant of the buttocks is the preferred site of injection, the deltoid or triceps muscles also may be used

Dosage

For adults, use the same dosage as that recommended for oil-wax preparations For infants, 0 2 cc (60,000 units), children up to ten years, 05 cc (150,000 units), and children over ten years, 1 cc (300,000 units)

How Supplied 'Duracillin, in Oil,' 300,000 units per cc., is supplied in 10-cc. rubber-stoppered ampoules (No 465) Refrigeration is not necessary Available at all retail drug stores

Cancer Diagnosis

The public has been exposed to extensive propaganda on the subject of the early diagnosis of malignancy as the essential item in the reduction of a disease which is the dread of mankind Millions of dollars are collected annually to support a campaign for research and detection The National government also has supplemented such research with huge sums No doubt, mass efforts to arouse an appreciation of the attendant dangers to life of a malignant process may be necessary and perhaps desirable, but the resultant cancer-phobia which has developed is an unfortunate accompaniment. Women in particular are affected because so much attention has been centered on their special organs. Unfortunately, the subjective symptoms which bring them to a physician may be those of a far-advanced stage of the disease, and, hence, more radical measures may be necessary than if the process had been diagnosed in its earlier phases

Numerous investigators have given their time and thought to methods for detecting cancers of the uterus and the cervix in their incipiency Papanicolauo, in the belief that such cancers give rise to exfoliation,

developed a procedure for collecting the cellular debus, and by special stains the components could then be identified However, as stated in a first report, in 1941, the interpretation of the smear required "the services of a careful and discriminating cytologist—few persons can be depended on for this work at the present time," Although these investigators admitted that they failed to detect the characteristic ma lignant cells in a small number of cases of demonstrated cancer, others who have in vestigated and studied the method have experienced less favorable results and have hesitated to recommend operative measures unless the cellular diagnosis was confirmed by a biopsy specimen. 2 3

Naturally, in our democratic medical field, when any doctor proposes something new or novel, the proposal is subjected to the acid test of confirmation by other investigators. But before the results of the latter are published, the "special" or "free lance" writers associated with some of our popular magazines pick up the original sugestion before it is fully proved and develop it into a lund, and often exaggerated,

article for consumption by avid readers For instance, a certain Clive Howard, writing for the Woman's Home Companion, refers to the cystologic test for cancer of the uterus as a method, "inexpensive, painless, and at least 97 per cent accurate If put into general use, it may almost wipe out this form of cancer" 5

The subject is well-discussed in a recent editorial which appeared in the Journal of the American Medical Association (January 31, 1947) In this editorial, attention is called to a critical article by two Philadelphia investigators, Scheffey and Rakoff, who found that in a study of 500 consecutive cases, including 63 proved cancers, positive smears were obtained in 70 per cent, in other words, 30 per cent were missed ⁵

It must be admitted that no one method

of diagnosis or even of treatment can be considered 100 per cent perfect and entirely satisfactory, but it is evident that this particular procedure, as in other cases, has its limitations. We do not have in mind any desire to decry the discoveries of Papanicolauo and the others who have developed a probably valuable diagnostic procedure. It is the exaggeration which is deplorable, particularly when it develops as a "message of hope" to possibly afflicted women. All in all, the indiscriminate employment of the test, and that without competent interpretation, may do more harm than good

Problems in Artificial Insemination

Artificial insemination as applied to human beings poses serious questions of law which should be understood by all physicians. One such question has been decided in a New York court, namely, the status and rights of the child and of the husband when other than the husband's semen was employed in the fertilization of the mother. As reported, the decision is quoted in part

Justice Greenberg said in his ruling from the bench "The Court has assumed for the purpose of its disposition that the plaintiff in this case was artificially inseminated with the consent of the defendant and that the child is not of the blood of the defendant. This child is not illegitimate"

Mrs —— had sought to prevent her husband from visiting her child after she had won a separation from him last October on the ground that the baby was the result of artificial insemination through another man

Since physicians will be queried by their patients in instances where such procedures are contemplated, it is highly important that they keep themselves informed of the questions of law involved. As the result of propaganda, inseminations with a donor's semen are no longer infrequent. Perhaps we may assume that the maternal instinct among women cannot be satisfied in any other way, although this assumption perhaps cannot be justified by the accepted rules of civilized conduct and the marriage rite. To quote further from the decision of the eminent jurist

Justice Greenberg said he expressed no opinion "on the propriety of procreation by the medium of artificial insemination," pointing out the court was not concerned with such matters. Nor was he passing on the legal consequences, in so far as property rights are concerned, in a case where the wife has been artificially inseminated with the husband's consent. He said that the propriety of procreation through artificial insemination "is in the field of sociology, morals or religion"

¹ New York Times (Jan. 14) 1948, p 27

We repeat, the public derives its information on medical matters largely from daily newspapers, magazines, the radio, and by word of mouth Not always, unfortunately, but often, the people will check suchinformation with their family physician To encourage this practice it is incumbent upon all physicians who have, of course, access to their professional sources of information, to read these carefully

The editors of the JOURNAL attempt to bring to the notice of all members of the Society significant news relating to as many aspects of medicine as possible in the hope that well informed doctors in the innumerable communities of the State can thereby function, in their individual contacts with their patients, as reliable sources of information on topics which have frequently been suggested to them for inquiry by what they have read in the sources mentioned above. All this may seem trite, perhaps, but the development of modern technics in medicine has, as in this instance, a very important and far reaching impact on society, extending beyond the technics themselves

Another contribution to this subject is an article by B Fain Tucker, J D, commented upon in the New York Herald Tribune, from which we quote as follows

The New York Supreme Court held legitimate a child produced by artificial insemination with the consent and knowledge of the husband, in the second case on record involving this modern medical procedure. An article by Miss B Fain Tucker, of the Illinos Bar, published in the spring 1947, issue of The Women Lawyers Journal, reported that the whole body of law on the subject consists of one Canadian case, Oxford vs. Oxford, 49 Ontario Law Reports (1921)

In the Ontario case the wife frigid at the time of marriage sued her husband for alimony alleging that after a temporary separation he had refused to receive her as a wife The husband countered with a charge of adultery, alleging that his wife had given birth to a child by another man. The wife admitted the birth of the child but declared the pregnancy had resulted from artificial insemination.

The Supreme Court of Ontario did not believe her story but stated that if the in-

New York Herald Tribune (Jan. 18) 1948.

semination had been "artificial," as alleged, the wife had been guilty of adultery

The contention by the wife's lawyer that it was not adultery for a married woman to produce a child by artificial insemination secmed to the Ontario judge "a monstrous conclusion."

That was in 1921—before the practice had become more than a medical curiosity. There are now, it was testified has week, 20,000 "test-tube" children in the United States This can hardly be a statistical figure. The actual number, perhaps larger, perhaps smaller, is not known since neither physicians nor the couples involved publish the facts

More complicated legal questions may arise, the article in *The Women Lawyers Journal* made clear Some of these might involve the physician himself Court action might, for instance, hinge on such issues as the following

Did the doctor obtain the written consent of both husband and wife to the procedure, after making sure the husband was not fertile and fully explaining to the couple the social and legal complications of the contemplated step? Did he make sure that the donor was physically and mentally fit to father a child of the wife?

In a later editorial we expect to comment further on the controversial subject of artificial insemination. The often laudatory propaganda conveyed to the public through various media should not be accepted with out due thought being given to the compli cating factors which may attend this procedure, especially from a heterologous donor It is not merely the success of a technic which must be considered, it is the aftermath which is to be borne in mind not limited to legal difficulties, there are other consequences of perhaps greater significance and importance Moreover, we might well question the decision of the honor able justice that "this child is not illegitimate."

If not, we should revise, necessarily, our conception of illegitimacy. The question is not an academic one. With the growing recourse to the production of the "test-tube baby," are we to set aside all our preconceived notions of propriety and decency? Can we not overcome these so-called "psychologic demands" of women by some other means?

Moreover, a rather pertinent question arises in this connection. Assume that the husband is pronounced fertile and the wife sterile. This reverses the picture and the extreme view could be taken that the husband's desire for progeny likewise might be satisfied through extraneous sources.

Should not he be accorded an equal privilege? We pose this question and not in a spirit of facetiousness. We await an answer, and we direct the question particularly to those women who feel that they should be given a right which presumably is withheld from their married partner.

Current Editorial Comment

Important Information for Doctors Physicians of New York State are hereby warned through the courtesy of the inspection service of the Post Office Department that the old "Spanish Swindle" has been revived and that new sucker lists containing the names of numerous doctors of the State are being used

The "Spanish Swindle" consists of a letter emanating from Mexico and addressed to the putative physician-sucker. A sample letter, furnished us by the Post Office Department, is reproduced herewith for your

information

Mexico City, Mexico December 16, 1947

Mr Jonathan A Doe St Edward, Nebraska USA

Dear Sir

A person who knows you and who has spoken very highly about you has made me trust you a very delicate matter of which depends the entire future of my dear daughter, as well as my very existence

I am in prison, sentenced for bankruptcy, and I wish to know if you are willing to help me to save the sum of \$375,000 00 U S Cy (Three Hundred and Seventy Five Thousand Dollars) which I have in bank bills hidden in a secret compartment of a trunk that is now deposited in a Custom house in the United States

As soon as I send you undentable evidence, it is necessary for you to come here and pay the expenses incurred in connection with my process so the embargo on my suitcases can be lifted, one of which suitcases contains a baggage check that was given to me at the time of checking my trunk for North America and which trunk

contains the sum above said To compensate you for all your troubles, I will give you the THIRD PART OF SAID SUM

Due to serious reasons which you will know later, please reply via AIR-MAIL. I beg you to treat this matter with the utmost reserve and discretion. Fearing that this letter might have gone astray and not reach your hands, I will not sign my name until I hear from you, and then I will entrust you with all my secret. For the time being I am only signing "M".

Due to the fact that I am in charge of the prison school, I can write you like this and entirely at liberty

I cannot receive your reply directly in this prison, so in case you accept my proposition, please air-mail your letter to a person of my entire trust who will deliver it to me safely and rapidly. This is his name and address

Sr Jose Cueto Calle de Donceles #40 Mexico City, Mexico

We warn all physicians who receive such a letter or any variant of it to take it immediately to the nearest post office and turn it over to the Postmaster Do not answer, the letter Under no circumstances send any money

Get the letter immediately to your Postmaster or send it to Mr J W Hartwell, Office of Inspector, Post Office Department, Albany, New York It is not yet known, we are advised, how widespread the swindle is Several physicians in the Buffalo area have received and sent to the Postal Inspection Service such letters

All who read this are requested to pass the

information on to other doctors

MANAGEMENT OF GASTRIC HEMORRHAGE

ALBERT F R ANDRESEN, M.D., Brooklyn, New York

(From the Long Island College of Medicine)

IN treating a patient with a gastric hemor-rhage, it is well to recognize the patient as an individual, requiring individual care Yet while there is danger in treating all patients according to some stereotyped routine procedure, it is also very important to recognize that there are certain fundamental principles involved which govern every case. Before treating the case as one of gastric or duodenal hemorrhage, it is essential that other causes of hematemesis and melena have been ruled out Blood from the mouth nose, or throat, swallowed while the patient is asleep and vomited on awaking may simulate gastric hemorrhago. Bleeding esophageal lesions, especially varices, are often confused, and even small intestinal ulcerative lesions may produce both hematemesis and melena. Blood dyscrasias jaundice, vicarious menstruation, severe toxemia and even malingering must be ruled out Bleed ing from the stomach or duodenum may not be due to peptic ulcer, but to severe gastritis, neoplasms, syphilis, rupture of a sclerotic artery purpura, or allergy

Symptomology and Diagnosis

A small amount of surface bleeding occurs with any ulcer, but gross bleeding recognized by vomiting of bright red, liquid, clotted or partly digested blood, may vary in quantity. If not vomited, blood passing through the digestive canal becomes black, and even as small a quantity as 60 cc. will produce a small tarry stool. A tarry stool is one which is not only black in color but sticky and tarry in consistency. Frequently patients will not notice blood in vomitus or may ascribe the red color to recently ingested tomatoes or beets, and even more frequently a tarry stool will not be observed, being described simply as loose.

If the amount of blood lost has been under 300 cc. there may be few, if any general symptoms accompanying it. With more severe hemorrhages, however, the general symptoms have often been ascribed to a "heart attack," or the vomiting and diarrhea to a "ptomaine poison-

ing" with severe toxemin. In most cases dizziness weakness to the point of fainting, chilliness and cold sweat occur accompanied by nausea and the vomiting of blood, followed sooner or later by the passage of a tarry stool

Symptoms of shock vary with the amount and duration of the hemorrhage and may become quite alarming, being accompanied in severe cases by the symptoms of anoxia, with air hunger as the most startling phenomenon. A day or two after the hemorrhage, pallor becomes more or less marked, and the patient feels generally weak and tired. A history of previous ulcer symptoms is important when obtained, but, not infrequently, hemorrhage is the first sign of an ulcer. History of previous hemorrhage may be obtained in 30 per cent of cases. In the absence of ulcer symptoms careful study is indicated to rule out some of the other sources of bleeding.

Physical examination is important but must be conducted with extreme caution in order to prevent recurrent bleeding. The eye grounds may show arteriosclerone or renal changes, the mouth, nose, and throat should be checked for bleeding points, the chest for possible bleeding lesions, and the heart for possible decompensation, causing congestion. In the abdomen the presence of tumors or an enlarged liver and spleen must be ruled out, and rectal and pelvic examinations should be made to discover possible lesions.

Endoscopic examinations, more liable to excite bleeding should be deferred until later when esophagoscopy may be necessary proctoscopy dearable Gastroscopy, performed after roent-genologic study, may at times disclose small erosions not otherwise recognizable.

Fractional gastric analysis, using histamine as an excitant of gastric secretion, had best be deferred until ten days after active bleeding has apparently ceased. If no bleeding is demonstrated by this method complete roentgenologic study should be instituted in order that the lesion causing the bleeding be recognized as soon as possible.

Blood counts will show an increasing anemia for the first few days as blood volume is increased by absorption of fluid from the tissues Blood urea

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Sention on Surgery May 8, 1948.

nitrogen is apt to rise to from 30 to 50 mg per 100 cc during absorption of the products of digestion of blood and often proves to be a valuable indication of continued bleeding, as it should begin to go down to normal within three or four days. A leukocytosis may be a danger signal, suggesting possible perforation, a severe infection, or a necrotizing neoplasm

Blood pressure readings also may be valuable indications of continued bleeding. Occasionally dropping as low as 60 and 70 mm systolic, or in previously hypertensive patients to 120 or 130 mm systolic, with low pulse pressure, it usually ceases to go down when bleeding stops and starts to climb a few days later

Indications for Treatment

Treatment is the most important desideratum when a gastric hemorrhage has occurred and should be started at once. The indications for treatment, applicable to bleeding from an ulcer, can be applied to bleeding from any other source, although it is worthwhile to rule out other causes whenever possible, so that, if present, suitable specific treatment can be applied to them. This would include the tying off or cauterization of bleeding vessels and the use of coagulants where indicated. In bleeding from ulcer the indications for treatment will be discussed in turn.

The bleeding results from a vessel, either cut across transversely or eaten out laterally, or, more rarely, may result from general surface bleeding due to congestion, to granulation of the ulcer base, or to surrounding erosions obvious that any increase in the quantity or pressure of blood in the bleeding vessel may prevent organization of a clot and cause recurrent bleeding The alternate tonic contractions and atonic periods, incident to hunger, would also tend to aggravate or reinstitute bleeding The gastric juice tends to attack the vessel and clot, allowing free bleeding Any irritants taken into the stomach, as well as the ingestion of ice, by causing hyperemia, would also have a similar effect. It is, therefore, important (1) To keep the patient at rest, if necessary aided by mild sedation, (2) To avoid too large a fluid intake, either orally or parenterally, (3) To keep in the stomach at all times a food substance (gelatin) which shall be smooth and coagulant and which should combine readily with gastric juice, (4) To avoid stimu-

The bleeding will then cease spontaneously unless the bleeding vessel is held in a mass of horny induration at the site of an old chronic (or perforated) ulcer—Such cases usually have been considered fatal in nearly every instance whether or not surgery was instituted, since operation usually necessitated an extensive procedure be-

cause of the friability of the tissues A treatment used successfully in several such cases is described below

Shock, a prominent symptom in most cases, is a conservative mechanism to produce the desired rest, hypotension, and lowered blood volume and should be treated conservatively by rest, by moderate warmth to the extremities, by psychologic care, and by sedation only as indicated Parenteral injection of fluids, even of blood, should be avoided if possible, and stimulants are usually unnecessary

Anova, as manifested by air hunger, falling blood pressure, and rapid thready pulse, calls for careful observation and, if not spontaneously checked, should be treated by small transfusions, 150 to 200 cc, just enough to overcome alarming symptoms. Transfusions of 500 cc or more often tend to aggravate the hemorrhage and may result in death

When 2 or 3 small transfusions fail to check the downward course, or if the patient is in extremis, continuous transfusions by the drip method, over a period of thirty to forty hours, using 6 to 8 L of blood, has been successfully used by me in 3 cases, all of whom are well today after five or six years

Anemia, which may be quite extreme, is usually overcome spontaneously, an increase of 15 or 20 per cent in hemoglobin and erythrocyte count taking place within two weeks. However, persistent anemia, such as often results from exhaustion of hematopoietic substances in the body as a result of repeated massive transfusions, with resultant hemorrhages, may require transfusions and hematinics after the first ten days

Complications must be taken care of as they occur In pylone stenosis, the treatment for hemorrhage is conservative, although operation may be necessary later In perforation, immediate operation, of course, is indicated

In closing, I will reproduce the "Routine for Gastric Hemorrhage Cases" which with occasional modification has been the standard for the gastro-intestinal service at the Long Island College Hospital for many years

The suggested diet, consisting of gelatin added to a high caloric liquid diet or, in cases where patients are allergic to milk or are at first nauseated by it, with fruit juices and glucose, will be first described, followed by the routine suggestions for care and medication

Routine in Gastric Hemorrhage Cases

- Order gastric hemorrhage diet
- 2 Treat shock by rest, warmth to extremities, and sedatives, if required.
- 3 Quiet apprehension. Reassure the patient Do not isolate

4 Do not take a detailed admission history nor make a complete physical examination Do no more than rule out complications or bleeding from causes other than ulcer

 Order blood coagulation tests coagulation and bleeding time, prothrombin time, vitamin K determination, and platelet count. If coagulation is

impaired, prescribe congulants

6 Type and match blood for transfusion. No transfusion to be used in first ten days except for evidence of severe anoxia. Then try 1 or 2 transfusions of 150 to 200 co of citrated blood. If not successful, prepare for continuous drip transfusion to be used until bleeding stops or at least for thirty-six hours (may require 6 to 8 L of blood).

7 Chart blood pressure every two hours at first blood urea nitrogen every two days at least

8. Test all stools for occult blood until this disappears

- 9 Start mineral oil 1/2 ounce, every night after second night. Retention oil enema on fourth night and thereafter as required.
- 10 Do fractional gastric analysis on about the twelfth day in uncomplicated cases
- 11 Start x rays on about the fourteenth day if bleeding has stopped

12 No gastroecopy until after x ray

- The following treatments and conditions should be studiously avoided
- 1 Ice Externally, increases shock. Internally, stimulates gastric circulation.
- 2 Parenternal fluids generally increase blood volume and pressure and cause more bleeding Small transfusions may be required in severe anoxemia. (See Routine.)
- 3 Stimulants (digitalis, adrenalin, etc.) Tend to increase bleeding Only used in emergency
- 4. Alkalis Stimulate secretion. Irritate bleeding area
- 5 Excitement or worry Increase shock, and reaction may increase bleeding
- 6 Examinations manipulations, or treatments Only if absolutely necessary, especially in first few days.

GABIRIC HEMOBRHAGE DIET

Gelatin-Milk Feeding.—Milk, cream and dex tross are mixed together and kept in the refrigerator Gelatin, at the rate of 50 Gm. per liter of the mix ture (Table 1) or approximately 75 Gm per day, kept in a paper cup at the bedside, is to be added at each feeding as follows

A rounded teaspoonful is to be dissolved in 1 or 2 ounces of warmed milk mrature and this is added to remaining cold mixture, making a cool palatable drink. If the petient profers it, the drink may be warmed A little flavoring (tea, vanilla, cocca) may be added at time of feeding if desired

Routins —For the first four days after the hemor rhage, feed 6 ounces of muture every two hours nothing else by mouth. If saleep the patient should not be disturbed for three or four hours

On the fourth, fifth and sixth days add to 3 or 4 of the feedings one of the following 1 egg soft boiled posched, or raw cercal, 3 ounces custard, jello or

TABLE 1 -FORMULA FOR GELATIN MILE FREDINGS

Food	Amount	Carbo- hydrate	Protein	Pat	Calorim
Gelatin Dextrose Cream	50 Gm. 60 Gm.	60 Gm.	45 Gm.		180 240
(20 per cent) Milk	100 ea. 900 ec.	3 Gm. 30 Gm.	3 Gm. 27 Gm.	18 Gm. 27 Gm.	180 850
		99 Gm.	78 Gm.	45 G m.	1 150 per L.

ice cream, 3 ounces, and allow water in 3 ounce quantities between feedings

On the seventh and eighth days, add 2 of above foods to each feeding

On the ninth day, order ulcer diet.

Gelatin-Water Feeding—Water dextrose, and orange juice are mixed together and kept in the refrigerator Gelatin, kept in a paper cup at the bedside, is to be dissolved in a part of the warmed mix ture (Table 2) as in the case of the milk mixture, or merely stirred into the mixture at the bedside.

This regimen is for patients who cannot tolerate the milk-gelatin feedings or who are allergic to milk.

TABLE 2.—FORMULA FOR GELATIF-WATER PERDINGS

Food Gelatin Dextrose	Amount 50 Gm. 90 Gm.	Carbo- hydrate 90 Gm.	Protein 45 Gm.	Calories 180 360
Juice of 3 oranges Water	to 1,000 es.	30 Gm.		120
		120 Gm.	45 Gm.	660 per L.

Routine —For the first two days after the hemornings, feed 4 ounces of the mixture every one and a half hours, the patient not to be disturbed more often than every three hours if salesp

After the second day if the patient is not really allergic to milk, the gelatin-milk routine should be followed. If the patient is allergic to milk, proceed

as follows

On the third and fourth days give 6 ounces at a feeding, every two hours, adding a teaspoonful of a protein diaysate or amino add preparation to each feeding. If the patient tolerates it well, add egg cereal, jello, or stewed fruit to 3 or 4 feedings per day (as in gelatin-milk routine)

On the auth, seventh and eighth days add 2 of

above foods to each feeding.

On the ninth day order ulcer diet, with no milk or milk products.

Vitamin C, 0.5 to 10 Gm per day, should be ordered with either routine diet.

It will be seen from a study of the above routine that in the case of the gelatin-milk feedings, a patient taking 9 or 10 feedings per day will be consuming nearly 2 000 calones in twenty-four hours with about 100 Gm. of protein. In the case of the gelatin-water feedings only 1 000 calories will be taken, with only about 60 Gm. of protein represented by the gelatin alone, or more if the patient can take a protein mixture.

In cases of pyloric stenous associated with hemorrhage I have followed the routine above in every detail, but with gentle aspiration of gastric residue once, or rarely twice, in twenty-four hours in order to prevent overdistention of the stomach. In every case the patient was benefited, whether the stenosis was relieved during the course of the treatment or whether it persisted in spite of it. In the latter cases gastric tone had been partly restored by the small feedings, making subsequent operation more successful. When the stenosis subsided, having been due only to inflammatory edema and induration about the ulcer, the ulcer due could usually be started on the tenth day or soon thereafter, preferably after an x-ray check-up

ULCER DIET

Our regular ulcer diet is started after the preliminary feedings of the gelatin mixtures and is kept up usually for six weeks thereafter when additions can be made to it gradually

The regimen is as follows

Breakfast

Milk 8 ounces

Cereal 5 ounces, with sugar and milk or cream Egg 1, soft boiled or peached

Bread or toast with butter, 1 or 2 slices Fruit juice 4 ounces (at end of meal)

Midmorning

Milk 8 ounces, always with crackers, bread and butter, or cake or

8 ounces of milk-gelatin mixture

Luncheon

Milk 8 ounces

Baked or mashed potato or plain spaghetti Egg 1, soft boiled or poached, or cream cheese Bread and butter, 1 or 2 slices

Pudding, custard, gelatin, ice cream, or stewed fruit

Midafternoon

Same as midmorning

Supper

Same as breakfast or luncheon

At bedtime and at two and one-half-hour intervals in night if awake feedings same as between meals

General

Cream and glucose may be added to feedings if patient is under normal weight

Olive oil 1/2 ounce, 3 times a day, before meals

Water ad lib

Salt not restricted

Vitamins added as required

Mineral oil if required, 1/2 ounce at bedtime

It must be remembered, above all, that each patient must be treated as an individual, and modifications of the suggested procedure may be necessary, especially in the presence of complications

PRIMARY RESECTION FOR CANCER OF THE LOWER BOWEL

HARRY E BACON, MD, FACS, and ROBERT J ROWE, MD, Philadelphia, Pennsylvania

R EFINEMENTS in surgical technic, coordinated treatment prior to, during, and following operation, with coincident improvement in anesthedia, have placed the management of the lower bowel malignancy on a plane of unprecedented security

Our discussion deals with a group of 560 pa tients with malignancy of the sigmoid, rectum and anus (Table 1)

TABLE 1 - DISTRIBUTION OF MALIGNANCY

Location	Number	Percentage
Sirmold	74	12 8
Rectosigmoid	169	29 8
Rectum	203	54 9
Anus	303 14	2 5
_		
Total	560	100

The histologic type of tumor was reported as shown in Table 2

TABLE 2.—DISTRIBUTION OF HISTOLOGIC TUMOS

Adenocarcinoma	54398 8 per cent
Epithelioma Bouamous Bassi	9
Fibrosareoma.	3
Leiomyonareoma Neurogenio sarcoma	
Total	560

The moderne of node metastass in a group of 67 cases was 36.2 per cent According to location, the incidence is shown in Table 3

TABLE 3.-INCIDENCE OF METABLES IN 67 PATIENTS

Location	Number of Cases	Node Metastassa, Per Cent
Sigmoid Rectorigmoid Rectum Anal Canal	13 14	60 63 3 44 1
Squamous Basal	4—87 1 0 0	50

In a group of 146 cases in which the removed specimen of bowel was sectioned scrally at 2, and 6 cm below the growth, invasion was observed in only 1 instance at the 6 cm level Consistent with these findings, the conclusion may be made that the sphincter musculature may be preserved, providing the lower margin of the cancerous growth is at least 6 cm. distant from the anal margin. In this series the incidence of venous invasion was 129 per cent.

Cancer of the lower bowel does not cast its ominous shadows by any pathognomonic or characteristic symptoms. The average period it ime between the onset of symptoms and the examination was nine and seven tenths months

examination was nine and seven tenths months

Presented, by lavitation, at the 141st Annual Meeting
of the Medical Society of the State of New York, Buffalo,
Section on Surgery May 9 1947

It is of interest to note that bleeding was cited in 470 patients (856 per cent) Seventeen patients suffered 1 or more hemorrhages, and in 3 cases hospitalization for transfusion of blood was found necessary

Change in bowel habit is a symptom-complex to be highly respected. Increasing constipation and the increasing need for laxatives was cited in 310 patients (53 7 per cent) Diarrhea, which is poorly representative, was described in 178 (317 per cent) The "false urge" to empty the bowel with the expulsion of flatus is significant and was noted by 212 patients (37.8 per cent) Incompleteness of evacuation was mentioned by 235 (41.9 per cent) Early morning diarrhea was complained of by 95 patients (16 9 per cent), while the passage of pencil-shaped stools was cited in 27 (4.8 per cent) Sensory disturbances referable to the bladder, prostate, or urethra were mentioned by 46 (8.2 per cent) sigmoidal lesions, where abdominal discomfort and distress tend to dominate the clinical picture. variants of pain occurred in 55 per cent which is comparable with the report of Rosser, namely, 61 per cent. In our group of patients the cancerous growth was palpated in 77 5 per cent and visualised sigmoidoscopically in 89 6 per cent

It may be of interest to mention that our associate, Dr George Broad, reviewed 161 consecutive case records of patients, subjected to abdommoperineal resection or excision, in which the extirpated bowel specimen was carefully examined *Recent specimens in this group were inspected by Dr Alexander Hering with the magnifying lens. Of the 161 resected specimens of bowel, 51 patients, or 31 6 per cent, showed adenomatous polyps in addition to the primary cancer, and of the 51, 10, or 19 6 per cent, were malignant.

The technical management of lesions of the rectum and agmoid ceases to be a moot question, as a result of the histologic investigations of Westhues, Fischer, Dukes, Coller, and David 18-14

Our approach to the problem has been to individualize each patient and to select the procedure to which he or she is best fitted. In this series of 560 patients, 520 were operated upon, giving an operability rate of 90.2 per cent, 467 were resected—a resectability rate of 80 1 per cent, with a mortality from resection of 5 5 per cent (26 deaths) It may be mentioned that we have performed radical resection in 145 patients by various technics without a single death. Our experience with low anastomosis "resectosigmoldectomy" has been almost nil,

and primary anastomosis of the sigmoid for cancer over a Furniss, Clute, or Wangensteen Clamp has numbered only 28 from which there were 2 deaths, a mortality of 7 1 per cent

While many methods have been employed for lesions of the rectum and rectosigmoid, we have found that the establishment of an abdominal colostomy and sacrifice of the sphincter muscles is an unnecessary evil in a large percentage of To the present time we have selected and performed the technic, "abdominoperineal proctosigmoidectomy," in 317 patients, from which there were 15 deaths, a mortality rate of 47 per cent

It may be mentioned that to determine the precise location of the lesion in the bowel, the records of 180 patients were studied (Table 4)

TABLE 4 -LOCATION OF LESION IN 180 PATIENTS

Sigmoid	23		
Rectosigmoid Rectum (exclusive	5333	8 per cent	80 3 per cent total
of lower 3 cm.) Anal canal (includ-	73—46	5 per cent	So s per cent total
ing lower 3 cm. of rectum)	31—19	7 per cent	
Total	180		

Assuming that those lesions in the sigmoid are resected solely by an abdominal approach, and those in the lowest 3 cm of the rectum and the 3 cm of the anal canal are resected by a method necessitating removal of the sphincters, there remains 80 3 per cent in which the sphincters may be preserved

It should be mentioned that this single criterion has been the only means of accepting or refusing proctosigmoidectomies As evidence that this group of 317 has included extended resections under unfavorable circumstances in some instances is shown in Table 5

In previous articles, we have discussed pertinent questions such as, "does preservation of the sphincter musculature compromise radicability?" and "does proctosigmoidectomy compromise radicability?" We have also attempted an unbiased evaluation of the complications and segulae pertinent to proctosigmoidectomy the development of this method our trials have been many, but with the cooperation of all, including the departments of anatomy, chemistry, and physiology, to say nothing of our resident staff and assistants, past and present, the results There is not. have been extremely gratifying and there should never be, one operative technic Because of the many to serve for all patients methods available, there are a few to which every surgeon should have recourse At no time, however, have we in our department entertained the faintest thought that we might some day return to the Miles type of resection for each and every patient

In previous articles, reference has been made to the low rate of morbidity following proctosigmoidectomy, for in a consecutive series of 120 cases, the average time the patient was permitted out of bed was six and six-tenths days, with discharge from the hospital in thirteen and fourtenths days 1-6 Ordinarily, patients return to work six or ten weeks after this type of resection The incidence of sexual impotence in the male is recorded as 8 3 per cent, compared to 95 per cent following the Miles operation

Our incidence of five-year cures, computed after the method of Newman of the British Ministry of Health, is 526 per cent which is based on those resected for palliation as well as for cure 7 For those patients in grade A classification according to mural penetration, the five-year survival rate is calculated in our series as 933 per cent

DIFFERENTIAL DIAGNOSIS OF ABDOMINAL TUMORS BY THE ROENTGEN METHOD

SAMUEL BROWN, M.D., Cincinnati Ohio (From the Jewish and General Hospitals)

IT IS well known that the abdomen is the most furtiful source of tumor formation. Early diagnosis is imperative if we hope to be successful in eradicating tumors from the body before invasion or metastasis sets in. The roent-gen method has greatly improved the chances of recognizing them much earlier than was ever possible by the clinical and physical findings alone.

In general, tumors originate from both within and without the gastroenteric tract. The latter group will receive chief attention in the present discussion. It may be added here that the word tumor is used in its larger sense and refers to any enlargement without reference to its exact nature.

The application of the roentgen method in the diagnosis of extragastroenteric tumors has been used since its inception, and a considerable literature has accumulated ¹⁻¹ My approach to this subject is distinguished by the fact that an attempt is made to establish a scientific basis for a diagnosis.

The abdomen contains a number of organs and attructures, occupying definite places which bear a constant relationship to each other and leave no empty space in the cavity. Thus, according to the unalterable law of nature that two bodies cannot occupy the same place, the enlargement of an organ or the presence of a new mass within the abdominal cavity will bring about the displacement or compression or both of an adjoining structure.

An analysis of the abdominal structures reveals that, according to the degree of stability, the organs are, relatively speaking either stationary such as the liver, spleen, kidneys pan creas, and gallbladder, or freely movable, such as the stomach and bowels

Regional and topographic anatomy (surgical anatomy) shows that the organs in the abdominal cavity do not lie in the same plane nor does a single organ occupy the same plane through its entire extent. It is evident, then that in order to obtain a true idea of the exact position, shape, and sire of any abdominal organ and its relation ship to other organs the abdomen must be subjected to a three-dimensional study

Heretofore, at least until recently, the roent

Presented, by invitation at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo Section on Radiology May 8, 1947 gen study of the abdomen consisted of making an anteroposterior reentgenogram which represented a two-dimensional projection, registering an accumulation of superimposed shadows of three-dimensional abdominal organs. Such a view will show alterations of the organs only in the longitudinal and lateral directions. It is evident that in order to obtain information of any changes in the anteroposterior direction a lateral projection is absolutely essential. Thus, each projection complements the other and, taken together, enable one to obtain a true three-dimensional study of each organ, and any deviation from the normal may be recognized readily

The application of the three-dimensional study of the abdominal organs reveals that in the presence of an enlarged organ or mass in the neighborhood of the stomach and bowels or both, alterations in the position, shape, or con tour may take place in the latter structures has been noted that these changes do not take place in a haphasard manner, but, in general follow certain directions, depending upon the organ which is involved and upon the position of the body as a whole Thus by certain distinguishing characteristics, it is often possible to determine with a high degree of accuracy the location and origin of the extragastroenteric tumor In general, it was found that tumors arising in the upper abdominal cavity displace the stomach and bowels downwards, whereas tumors which arise in the lower abdominal cavity cause an upward displacement. Tumors arrang in the right side displace the stomach and bowels to the left and cause displacement to the right when they arise on the left side Tumors arising medially displace the stomach to the left and the duodenum to the right. Tumors arising behind the stomach and duodenum disblace the latter forward and backward when the tumors arise in front of the stomach.

The following routine is carried out in the roentgen study of the abdomen

- 1 Fluoroscopic inspection of the chest with special reference to the position and mobility of the diaphragm. This structure is often found to be elevated in part or in whole as a result of an intra-abdominal tumor.
- 2 A plain anteroposterior projection of the abdomen is considered to be absolutely essential, for it may reveal important information as to the presence of an abdominal tumor

3 In the 4 standard horizontal positions, dorsal, ventral, right and left lateral, a roentgen study of the gastroenteric tract is made, not so much for its own sake but in reference to its topographic relationship to the neighboring organs

A brief review will be presented describing the usual location of the stomach and bowels in

the several standard positions

In the dorsal and ventral positions the stomach and duodenum lie in the left upper and middle zones, either transversely or vertically or anywhere between these 2 extremes, depending upon the habitus of the individual and the position of the body as a whole. Thus, in the sthenic type of individual the transverse position prevails, while in the asthemic the vertical position is the rule. The jejunum usually occupies the upper left side and the ileum the lower right side of the abdomen. The colon is located at the periphery with its transverse portion below the greater curvature of the stomach.

The liver is located in the right upper and middle zones, and its left lobe overlaps a good part of the stomach. The gallbladder and the extrahepatic biliary ducts he to the right of the pylorus and duodenum. The right kidney lies to the right of the spine behind the liver and descending duodenum. The pancreas extends from the duodenal loop across the spine to the spleen behind the stomach. The hepatic flexure follows along the lower margin of the liver.

The spleen is located posteriorly in the left upper zone and the left kidney below and medially. The splenic flexure of the colon is usually located below the spleen, but at times it reaches the under surface of the diaphragm.

In the right lateral decubitus position the fundus and cardiac portions of the stomach are located anteriorly with the anterior wall of the stomach almost parallel to the abdominal wall, while the posterior wall is parallel to the spine The left lobe of the liver, although in front of the stomach, produces very little compression upon the anterior wall under normal conditions In obese individuals a thick layer of fat may be present, but the normal parallelism is not upset The same applies to the posterior wall of the stomach in its relation to the spine, the distance being greater in the sthenic than in the asthenic In order to avoid misinterpretation ındıvıdual the particular habitus of the individual should always be kept in mind before a diagnosis of a retroperitoneal tumor is made

In the right lateral projection the pylorus lies between the cardiac portion of the stomach and spine with the duodenal bulb sitting on top of it. From here the course of the duodenum is backward, and at the superior angle it bends downward, paralleling the spine in front of the

right kidney and bending upward toward the left side at the inferior angle in front of the spine, below the body of the pancreas it joins the jejunum. Thus, in the lateral position the duodenum is presented in its true perspective, describing a loop within which the head of the pancreas is enclosed. The distance between the descending duodenum and spine varies, depending upon the habitus of the individual, being greater in the stheme than the astheme individual. In the latter the duodenum very often overlaps the spine.

The relationship which exists between the duodenum and the surrounding structures, namely, the stomach, pancreas, gallbladder, liver, extrahepatic biliary ducts, right kidney and colon, is quite intricate, and a knowledge of this relationship, as it is presented by the roentgen method, is quite essential in order to enable one to diagnose tumors of these structures

The superior angle of the duodenum is surrounded by the neck of the gallbladder on the right side, by the cystic and hepatic ducts above, and by the common bile duct on the left side. This tubular structure resembles a horseshoe whose open ends are directed downwards toward the head of the pancreas and gallbladder, respectively, forming an almost closed ring which practically encircles the superior angle of the Furthermore, it is re-enforced by the solid structures of the liver above, the pancreas below, and kidney behind That makes the duodenum what it is, the most fixed segment of the small bowel It is, therefore, to be expected that an enlargement of any of the neighboring structures will be reflected in the position. shape, and contour of the flexible walls of the duodenum

In the left lateral projection the direction of the stomach is, from above, downward and forward, and the degree of inclination depends upon the habitus of the individual, being almost at right angles to the spine in the sthemic individual, parallel to the spine in the asthemic individual, or anywhere between these two extremes. Again, before deciding whether there is a displacement as a result of a tumor, the habitus of the individual must be taken into consideration.

In the great majority of cases the following deductions were found to be correct

1 Displacement of the stomach and duodenum to the left and backward indicates a large liver Displacement of the stomach and duodenum to the left and forward indicates a large kidney Displacement of the stomach and duodenum to the left but neither forward nor backward indicates a large gallbladder

- 2 Displacement of the stomach and duodenum to the right and forward is due either to a large spleen, kidney, or pancreas In case of a large spleen or pancreas, the splenne flaxure is usually displaced downward which is generally not the case with tumors of the kidney If the stomach and duodenum are displaced backward, it is due to onlargement of the left lobe of the liver
- 3. Displacement or lack of displacement of the stomach and duodenum in opposite directions in the ventral position, but with forward displacement in the lateral position, indicates a retroperitoneal tumor, either pancreatic or glandular Backward displacement indicates a liver tumor
- 4. Enlargement and compression of the segment of the duodenal loop, both in the frontal and lateral projections, indicate a tumor of the head of the pancreas Enlargement of the loop in the frontal position, but with narrowing in the lateral position, may be due to a superimposed tumor from the transverse colon
- 5 Pressure defects upon the contour of the duodenum indicate a large gallbladder when the bulb is compressed Pressure defect upon the superior angle indicates dilatation of the extrahepatic billary ducts due either to stones or, more often, to tumors When the pressure defects are associated with paindice, this usually indicates the presence of the obstructive type, which is, of course, of great importance in the differential diagnosis of the nonobstructive type.

More than one abdominal tumor may affect the stomach and duodenium in different directions which at first may appear to be confusing but upon a careful analysis of the alteration which takes place in the various positions of the body one may arrive at a correct interpretation.

Conclusion

The roentgen study of the gastroenteric tract and its relationship to the neighboring struc

tures, as revealed in the above outline, has enabled us to arrive at an accurate diagnosis of extragastroenteric tumors with a high degree of accuracy

Discussion

Leo Larkin, M.D., Ithacz.—We have all been cognizant of many of those effects on the duodenum of tumors arising outside the gastrontestinal tract. I doubt whether many of us have appreciated, however the large amount of information the apeaker has been able to correlate by having a thorough knowledge of the anatomic relationship of both the intra and extraportioneal organs of the gastrointestinal tract, and by combining with this knowledge the application of good judgment and common sense in interpreting the indirect changes brought about by abnormal variations in these structures.

Dr Brown has demonstrated beyond question the great value in revealing pressure defects in the duodenum, particularly, which would be completely overlooked without the use of the right lateral decubitus position. In spite of his provious publications on the subject I think many of us have been lax in making full use of this suggested position.

In retrospect I am sure I have missed several opportunities to make a more accurate diagnosts by not using the right lateral decubitus position routinely Probably, the greatest value we could all derive from this presentation would be to adopt the use of this position in all studies of the upper gastrointestinal tract.

Today particularly, when there are so many physicians who feel they are quite competent to make their own interpretations of ordinary lesions of the gastrointestinal tract, it becomes necessary for us, as radiologists, to be able to recognize these more obscure lesions which as Dr Brown has demonstrated can be done

THE SCHERING AWARD FOR 1948 ANNOUNCED

The interesting and vitally important subject of The Role of Hormones in the Maintenance of Pregnancy" is the basis for the Schering Award for 1948

For the three best manuscripts submitted by undergraduate students of American and Canadian medical schools on such a designated phase of endocrinology, the Schering Award annually offers cash prisos of \$500 \$300 and \$200

Through his efforts in preparing a manuscript for the competition, the medical student acquires useful information in various important fields of endocrinoloxy. The Schering Award is sponsored by the Schering Corporation of Bloomfield New Jersey.

CLINICAL EXPERIENCE WITH NITROGEN MUSTARD

W W FALOON, MD, and L W GORHAM, MD, Albany, New York

(From the Department of Medicine, Albany Hospital)

As A result of wartime research, the battle against neoplastic disease has received a new weapon, a group of drugs now known as the nitrogen mustards—Following a large amount of, as yet, unpublished work on the chemical and biologic effects of these drugs, they were released in 1946 for further clinical investigation—The preliminary trials and reports on these compounds were accomplished by Gilman and Philips, Rhoads, Goodman, Wintrobe and their coworkers, and Jacobson and his associates 1-4 At present, the work is being coordinated by the Committee on Growth of the National Research Council 5

Following World War I, there were a few reports describing the effects of mustard gas (sulfur mustards) on the hemopoietic and gastrointestinal systems $^{6-10}$ This work was extended experimentally during the recent war in preparation for defense against poison gas. This led to extensive study of mustard gas, bis(β -chloroethyl)sulfide, and its nitrogen analogues, bisand tris(β -chloroethyl)amines. The latter have become the agents of choice in this group

Briefly, these compounds can be characterized as contact vesicants and cytotoxic substances. The degree of susceptibility of cells to their action is related, in general, to the degree of proliferative activity. The action which these mustard compounds accomplish on cells can be likened to no other known chemical agent but in many ways resembles that of x-ray

The basic formula and fundamental reaction of the (\$\beta\$-chloroethyl) amines are shown in Figures 1 and 2 Essentially, the reaction is the phenomenon of intramolecular cyclization in a polar solvent, shown in Figure 2, to form a cyclic

"onium" cation which yields the activity of the compounds. The great reactivity of the onium cation imparts the varied actions to this group. It reacts readily with amons and various unchanged nucleophilic molecules. The nitrogen mustards are stable in strong acids which make possible their isolation in the form of hydrochlorides. However, the sulfur mustards assume the sulfonium form more readily, and its reactivity is so great that its isolation in sufficient amounts is difficult. This is merely a practical difference in obtaining the 2 types of compounds, and their physiologic actions do not differ significantly.

REACTIONS of METHYL bis (& CHLOROETHYL)
AMINE IN DILUTE AQUEOUS ALKALINE SOLUTION

$$CH_{3}-N \xrightarrow{CH_{2} CH_{2} CI} \xrightarrow{CH_{3}-N-CH_{2}CH_{2}+CI} \xrightarrow{CH_{2} CH_{2}+CI} \xrightarrow{CH_{2} CH_{2}+CI} \xrightarrow{CH_{2} CH_{2}+CI} \xrightarrow{CH_{2} CH_{2}+CI} \xrightarrow{CH_{2} CH_{2}+CI} \xrightarrow{CH_{2} CH_{2}+CI} \xrightarrow{CH_{2} CH_{2} CH_{2}+CI} \xrightarrow{H^{+}+CH_{3}-N} \xrightarrow{CH_{2} CH_{2} CH_{2} CH_{2}} \xrightarrow{CH_{2} CH_{2} CH_{2} CH_{2}} \xrightarrow{CH_{2} CH_{2} CH_{2} CH_{2}} \xrightarrow{CH_{2} CH_{2} CH_{2} CH_{2}} \xrightarrow{CH_{2} CH_{2} CH$$

A variety of alkyl groups can be attached to the nitrogen atom of the nitrogen mustard compound and therein lies the value of the drug, as in the sulfonamides, the possible chemical combinations are many, and the future will doubtless see them explored It is now known that the onium cation of the nitrogen compounds, ethylenimonium, reacts with a number of compounds of biologic importance Among these are amino acids, thiamin, phosphates, various enzymes, and proteins, such as hemoglobin, insulin, and albumin In vitro studies have shown that the mustards reduce the oxygen consumption of tissues and depress the aerobic and anaerobic glycolysis of glucose Not all the enzyme systems studied in vitro have been shown to be affected equally in vivo, however, but among those enzymes affected are hexokinase, phosphokinase, and peptidase in the serum, skin, and lung. The basic mechanism is probably through some reaction with a vital cellular constituent, but the specific chemical lesion has not been found.

The cytotoxic effects of the mustards are most marked on the lymphatic, hemopoietic, and gastrointestinal systems. The seventy of this response is in direct relationship to the dose ad ministered Among the demonstrable pathologic changes are vacuolization and nuclear swelling of the epithelial cells of the gastrointestinal tract, lymphatic fragmentation and atrophy, and a disappearance of mitotic activity Lethal doses produce death by circulatory collapse as a result of the nausea, vomiting, diarrhea, and electrolyte less which occur Bone marrow and blood studies following nitrogen mustard ad ministration have revealed production of an aplastic anemia picture with leukopenia and thrombocytopenia. Regenerating tissue shows a reduced mitotic rate and the mitotic arrest appears to be confined to the resting phase of the mitotic cycle. Chromosomal changes which are transmitted through generations in a manner similar to that produced by x ray have also been demonstrated. It should be mentioned however, that abnormalities of cell structure and function occur which are not attributable to primary nuclear intoxication For a more complete review of the basic characteristics of the mustard compounds one is referred to the paper of Gilman and Philips 1

Reported Clinical Use

In 1946, 2 reports of the clinical use of nitrogen mustard appeared which discussed the results of treatment on 126 cases of neopleatic disease 14 The work thus far has been con fined largely, to its use in Hodgkin's disease, lym phosarcoma, leukemia, and poly cythemia vera, al though scattered cases of melanosarcoma, reticuloendothelious, carcinoma of the breast, carcinoma of the cervix, giant follicle lymphoma, sympathoblastoma multiple myeloma, and undiagnosed tumors have been treated These miscellaneous diseases were, except for sympathoblastoma unaffected in the cases reported Temporary improvement was noted in 2 patients with sympathoblastoms. A recent communication from the National Research Council reports transient reliaf of symptoms in 21 of 30 cases with inoper able carcinoma of the lung. It is to be remembered that, in the cases reported the dosage varied widely and improvement in these statistics may occur with further experience. At present, however it seems that the best results are to be expected in the neoplastic diseases of the lym phatic and hemopoletic organs

Among the changes noted by the investigators

in these early series of cases were decrease in lymph nodes, sploen, and liver sue, disappearance of fever and malaise, gain in appetite and weight, and occurrence of a sense of general well-being

Albany Hospital Experience

In November of 1946, a supply of methyl bis(s-chloroethyl)amine hydrochloride was made available to the Albany Hospital It is our purpose to present at this time our experience with the use of this drug in a series of 15 patients treated in the six months since that date. These are summarized in Figure 3.*

Methods and Material -All patients except 1 received intravenous injections on four consec utive days of 01 mg of methyl-bis(s-chloroethyl)amine hydrochlonde per Kg of body weight In order to reduce the severity of the immediate toxic symptoms of nausea and vomiting nearly all patients received the injections after an overnight fast. Three grains (0.2 Gm.) of sodium amytal were given by mouth an hour before treatment Because of marked vomiting following the first two injections, in 1 patient the treatment was discontinued for one day, and the course was then completed Because of the known vesicant property of the drug at was prepared and administered with care in order to avoid contact with the skin the person administering it wearing rubber gloves. The injection was made through the tubing of a rapidly flowing intravenous solution of normal saline in order to avoid subcutaneous leakage of the medication Because of rapid loss of activity after the pow dered drug is put into solution, the procedure is carried out within five minutes after dissolving the nitrogen mustard

All patients were followed with complete blood counts at least twice weekly for the three weeks following injection and examinations were per-

The authors wish to express their gratitude to the following for permission to study cases under their care: Dr. Richard T. Besbe, Dr. James F. Rooney. Dr. Frank Maxon, Dr. Joseph Robinson, and Dr. Kalmon Rosenblatt.

This is part of a study authorized by the Committee on Growth of the National Research Council, New York City Dr G. P Ithouds is chairman of the committee. The supply of nitrogen mustard was kindly furnished us by Merck and Company Inc., Rahway New Jersey The authors wish to express their gratitude to the follow-

formed at least once a week Most of these patients were hospitalized for fourteen to twentyone days in order to follow them closely. It is
our practice now, however, to discharge the
patients, if hematologic studies can be obtained
at home or in the outpatient department, and
providing adequate follow-up is possible outside
the hospital. After the critical initial threeweek period, patients have been seen at one- or
two-month intervals.

Thus far, 15 patients with Hodgkin's disease, polycythemia vera, lymphosarcoma, and leukemia have received a total of 19 courses of nitrogen mustard treatment. The follow-up on these patients at the time of this report varies from three weeks to six and a half months.

Toxic Effects — The immediate effects of the drug occurred within one to six hours after in-These effects consisted of nausea, vomiting, and anorexia in 11 patients symptoms were less marked after the first day, and frequently, subsequent injections caused only Anorexia alone was observed in 2 patients, diarrhea in 2 patients, and no reaction in 2 others One patient noted headache follow-It is of interest to remark that ing injections those showing no reaction were probably the 2 None of these most severely ill in the series toxic symptoms persisted after the course of injections was completed Thrombophlebitis at the site of injection developed in only 1 case

Perhaps the most serious toxic effect of the drug was the hematologic change produced Except in patients who received blood transfusions, the hemoglobin and erythrocyte determinations showed a transient decrease. This was most marked within the first three weeks except in cases of polycythemia vera where the maximum

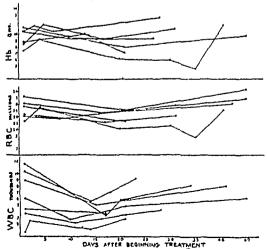

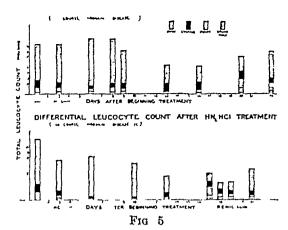

Fig 4

drop usually occurred after the first month and persisted longer than in the other diseases Leukocyte counts showed a significant decrease in all but 1 case This phenomenon manifested itself in an initial lymphopenia, followed by a neutropenia within two to six days Recovery of the blood picture was noted as beginning in the third or fourth week, and in patients who showed a good response to therapy, recovery was usually complete in eight weeks Some typical changes, showing the composite of the blood pictures in 6 cases of Hodgkin's disease, are presented in Figure 4 One patient received 2 courses of treatment and his leukocyte counts are included in this chart Figures 5 and 6 show

DIFFERENTIAL LEUCOCYTE COUNT AFTER HN HCI TREATMENT (POLYCYTHEM A VERA PT)

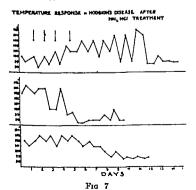

the changes in differential count following therapy in 1 case each of Hodgkin's disease and polycythemia vera In Figure 5 the changes occurring in both the first and second courses are shown On the eighteenth day after the second course, the patient developed stomatitis, and penicillin was administered until the twentyfirst day with subsequent clearing of the lesions The polycythemia vera shows the most severe drop in leukocytes recorded in this series, going from 20,000 on admission to 500 white blood cells on the fifteenth day after therapy had begun In spite of this, no untoward complications en-It is of interest to note also that therapy was undertaken on 1 patient with an initial blood count of 650 with excellent clinical response and an actual improvement in the leukocyte picture

The leukopenia in 2 patients of this series was complicated by mouth lesions resembling Vincent's angina, treatment with penicillin and oridizing mouth washes was required Excellent reponse was obtained in both these patients under such therapy. One other patient received penicillin prophylactically when his leukocytes dropped to 2.000

In all patients followed with platelet counts, a significant decrease was noted, paralleling the hemoglobin change. Other investigators mention purpura as a complication of this drug induced thrombocytopenia, but such has not been noted in our series. 3.4

Hodgkin's Disease.-Six patients Results. with Hodgkin's disease have been treated with responses in all after the initial course. Remisgions have been induced lasting from one to five months. Three of these had had previous x ray therapy, and one had been classed as unsuitable for further therapy by that method sponse in these cases has been marked by reduction in the are of lymph nodes, spleen, and liver and a remarkable return of temperature to normal. Typical cases are shown in Figure 7 Weight gams of 5 to 20 pounds (2 4 to 9 Kg) and remarkable improvements in appetite have been noted One patient, whose clinical picture was that of Hodgkin's disease but in whom a positive biopsy was not obtained, was relieved of persistent abdominal pain, following a course of nitrogen mustard

Two cases have had recurrence of symptoms and response to re-treatment. A third patient illustrates the limitations of this drug This was a 42-year-old man with a fifteen year history of lymphadenopathy, proved mne years before admission to be Hodgkin's disease by lnopsy X-ray therapy had given good remissions until

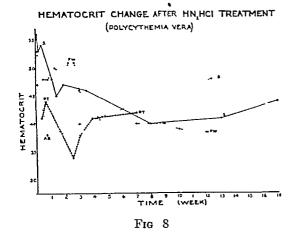

September, 1946 At that time he noted weight loss, weakness fever, and anorexia. The x ray department of this hospital felt that he would not respond to further therapy On November 4, 1946, he was given his first course of nitrogen mustard injections and was transfused twice His symptoms subsided, and a 20-pound weight gain was recorded In January, 1947, a recurrence of symptoms followed, and after a tenweek remission he was re-treated. A seven week interval of relief took place, and exacerba tion at this time prompted a trial of x ray therapy Little or no improvement was obtained and in April, 1947, a third course of nitrogen mustard treatment was given. This did not produce a response, and he expired ax weeks

It is suggested by our findings in this case, and substantiated by the published case reports that nitrogan mustard will induce a response in Hodgkin's disease patients who are x ray refractory or in whom such thorapy is deemed inadvisable. At the same time, however, it may be inferred that response to nitrogen mustard will gradually become less and less on repeated treatment in the same patient.

Polycythemia Vera — Four patients with polycythemia vers were treated with responses of three to five months' duration. One of these patients was diagnosed as a possible example of the transition from polycythemia to early myelogenous leukemia because of the appearance of a 20.000 leukocyte count and myeloblasts seen on blood smears. The hematocrit changes in these patients are shown in Figure 8. All of these patients were relieved of symptoms, such as headache, vertigo, and paresthemas of the extremities One patient with pain over the spleen which extended to a point just above the nubis obtained marked relief from pain, and the size of the spleen was reduced to an area within 6 cm. of the costal margin. Reduction of splenomegaly was a constant finding in these cases.

The degree of improvement in the climeal condition of patients with polycythemia treated here is in accord with that obtained in the 5 cases thus far reported in the literature 4 Al though the response in these patients is slightly slower than in the other diseases in our series, it appears that the duration of the romissions may be longer, some reported to have lasted up to fifteen months.

Lymphosarcoma.—Three patients with lymphosarcoma have been treated with nitrogon mustard with a follow up of three weeks, three and a half months, and six and a half months, respectively These cases have shown remarkable reduction in lymphadenopathy and in 2 cases weight gain has been recorded. The first pa-

tient in the Albany Hospital series is included in this group, having entered with a three-month history of painful swelling in the right axilla. This had become worse until, on admission, there was edema and swelling of the entire right arm, and the patient was unable to move the extremity without pain. The nodes were noticeably smaller within six days, within six weeks all adenopathy and edema had disappeared, and the patient felt able to return to work. This remission still continued six and a half months later with a total weight gain of 18 pounds

It appears from our cases and those reported that the response of lymphosarcoma to methylbus (\$\beta\$-chloroethyl) amine is very similar to that produced by roentgen therapy. A true companson cannot be made as yet, but it is to be remembered that in the localized form of this and similar tumors, radiation therapy can be concentrated on the involved areas

Leukemia —We have undertaken treatment on 2 cases of leukemia in our series, both of them being chronic myelogenous leukemia in elderly women in the advanced stages of their disease One patient had had previous x-ray therapy and had received over two hundred transfusions at weekly intervals Therapy was undertaken on this patient as a last resort No apparent effect was obtained, and she died twenty-five days after the course was begun Autopsy showed no changes in the leukemic state attributable to the nitrogen mustard therapy The course of the second patient was steadily downhill and was remarkable only in the transient improvement in the white blood cell series shown in the fourth week when the myelocytes dropped to 3 per cent from a previous 20 per Autopsy was not obtained on this patient

Our brief and discouraging experience with leukemia has conformed to that of the previously mentioned authors, and it is doubtful whether nitrogen mustard has any advantage over other known methods of therapy for this disease These 2 patients were treated early in our series, and we have been hesitant to treat further cases

Summary and Conclusions

The chemical and biologic actions of the mustard compounds have been reviewed. Following the reports of other investigators, working with the nitrogen mustards in patients with neoplastic disease, 15 patients have received 19 courses of treatment in the Albany Hospital since November, 1946. The results of this series of cases have been reported and our clinical experience reviewed.

On the basis of the physical, symptomatic, and hematologic changes observed in these patients, we feel that the use of the nitrogen mustards in Hodgkin's disease, polycythemia vera, and lymphosarcoma will frequently induce temporary remissions. Our experience, confirming that of other workers, does not allow a similar view of the leukemias treated with this substance, namely, methyl-bis(\$\beta\$-chloroethyl)amine Further follow-up on this work must be done before final conclusions can be reached

The toric effects of the drugs make them potentially dangerous, and it should be emphasized that they must be used with care, both in handling and in the follow-up of their effects on the hematologic picture

The greatest value of the nitrogen mustard compounds lies in the potentialities which they possess by virtue of their chemical structure. We view with optimism the possibility of obtaining less toxic and more effective compounds in the future as a result of changes in chemical formula. At least one chemical approach to the problem of neoplastic disease appears to have been opened as a result of the investigation which has been carried out and is now being continued.

ON ORIGINAL WORK IN PLASTIC SURGERY IN NEW YORK STATE

ELIOTT B HAQUE M.D Buffalo New York

THERE can be few intelligent laymen, mediwho have not some preconceived opinion of what
constitutes plastic surgery Before the recent
war, well bruited were the wares of those who
lifted the wixened face, electrocuted the undesired hair. During the war, while articles written
for laymen told faneiful tales of the restoration to
normal of destroyed faces reconstructive surgery,
always an important element of military medicine, made real headway in the hands of reconstructive surgeons, Major Arthur E Sherman,
of East Orange, Commander Samuel M. Dupertus, of Pittsburgh, and Major Gerard Devoe, of
New York City, to mention a few

If by plastic surgery you mean reconstructive surgery, you imply that general surgeons restrict themselves to extirpation, unless you are willing to admit that most surgeons practice plastic sur gery and that many plastic surgeons limit their work to certain regions. The latter is nearer the truth. Pelvic reconstructions remain the prov ince of the general and gynecologic surgeons The orthopedic surgeon constructs as well as amputates Today, as through the centuries the ophthalmic surgeon exercises ingenuity and maintains interest in the essentially plastic surgery of the extraocular muscles correcting a num ber of varieties of strabismus Besides in shortening and lengthening these muscles, he has developed technics for their transplantation has devised major procedures for the reconstruc tion of the eyelids, structures which have two important surfaces and which are not immobile The movement of the upper eyelid can be well compared, as it opens and recesses itself into the orbit, to the roller top of a deak. The technics of ophthalmic surgeons, in the correction of ptosis utilizing by transplantation the superior rectus and levator muscles which pull into the orbit produce an effect more naturally functional than the method commonly employed by general plastic surgeons, who link the lid, as though it were a curtain, to the muscle structure of the forehead. It is not necessary to labor the point when it comes to the problem of corneal transplantation, of who is best qualified to undertake this variety of plastic surgery

In this general connection it is notable that before our era of rather intense specialization surgeons who were interested particularly in the operative cure of cataract and of strabismus were usually prime movers in orbital and general tissue reconstruction. Moreover, those who call themselves plastic surgeons undertake cases where, as in advanced malignant tumors of the head, the surgery is entirely extirpative, since much reconstruction is not practicable.

Does the history of plastic surgery in this country confirm the European inference that reconstructive surgery is naturally the contribution of regional surgeons interested in restorative problems? A century ago Warren in Boston Mutter in Philadelphia, Post in New York City and Frank Hastings Hamilton in Buffalo were the leading exponents of plastic surgery on this side of the Atlantic. Most of these doctors were particularly interested in surgery of the eye and surrounding structures, two of them Post and Hamilton, each published in the 1840's treatises on the surgical correction of strabismus Of them, Hamilton exerted perhaps the most extended influence, certainly he contributed more in the way of original technics

The settlement of western New York State by the white race dates only from 1788 In 1814, Buffalo was burned In 1830, the population of Buffalo was less than 9,000 that of Rochester less than 10 000, that of Syracuse about 2,000, and the population of Albany was nearly 25,000

In western New York State, I find no record of plastic surgery prior to Frank Hamilton and substantially no record of any plastic surgery being performed by anyone else prior to the Civil War (In 1855, Dr H A. Potter of Geneva, New York, removed an upper jaw that is, the maxilla and surrounding tissue because of the presence of a tumor, apparently a carcinoma originating in the antrum) On the basis of published case reports, Dr Hamilton was undertaking more reconstructive surgery than anyone else in the state and about as much as any sur geon in the country During this period surgical interest in plastic technics mounted sharply is clear that there was then a new realization of the various great possibilities of surgical reconstruction

Dieffenbach who published his maugnural dissertation on this topic in 1822 his classic monograph in 1829 and his Operative Surgery dealing with reconstruction technics in 1845, was widely read Velpeau's Operative Surgery translated by an American P S Townsend, under the supervision of Valentine Mott, presented a large amount of material much of it of recent origin.

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Section on History of Medicina, May 8, 1947

in this field. The translator published the large section dealing with plastic surgery in the first volume because "it will be generally considered of higher interest. Than any other part of the work it contains nearly all the latest discoveries and processes in that most important branch of the art which has not inaptly been called *New Surgery*, since it has sprung up, or rather, made such astounding advances within the last ten years only, that it may be almost said

618

So keen was the interest in this subject, that an American Appendix of 175 pages was appended to this volume, dealing with new technics in plastic reconstructions developed in this country during the decade.

to date its very birth and existence within that

short period of time"

It is, by the way, quite clear that the great expansion in applying the principles of plastic surgery during the middle third of the nineteenth century was not due to the discovery of surgical anesthesia mainly. Dr. Hamilton was ultraconservative in his views regarding the safety and general use of anesthesia, and most of his operations during this time, when he made a number of original technical contributions to the field of plastic surgery, were done without anesthesia of any sort.

The career of Dr Hamilton fully annotates the early history of plastic surgery in western New York. Dr Frank Hastings Hamilton, one of the founders of the New York Medical Association, was born September 10, 1813, and died August 11, His father was a farmer and owner of a line of stages which ran between Bennington and Brattleboro, Vermont, across the mountains 1816, his parents moved to Schenectady, where he studied at the Lancasterian School and later at the Schenectady Academy He entered Union College and was admitted to the sophomore class in 1827, when he was only fourteen years old then entered his name as a student of medicine in the office of Dr John George Morgan, at that time physician to the State Prison at Auburn, and, therefore, permitted to use the bodies of dead convicts for dissection. During the winter of 1831-1832, Hamilton attended a course of lectures at the College of Physicans and Surgeons of the western district of the State of New York at Fairfield, Herkimer County The class numbered 201, of whom four graduated, for at that time comparatively few graduated from medical Most of the prospective surgeons were examined by county censors, a few by state censors, thus attaining a license to practice In 1833, Dr Hamilton received a license to practice medicine and surgery from the Cayuga County Medical Society and opened an office in Auburn Dr Hamilton took the degree in medicine at the University of Pennsylvania He returned to Auburn and commenced teaching by delivering a private course upon anatomy and surgery

Four years later, Dr Morgan, his preceptor, relinquished his teaching in Auburn for the professorship of surgery at the Geneva Medical Dr Hamilton was appointed in his place at the Western College of Physicians and Surgeons of Western New York. The announcement was made in the annual bulletin of the college as follows "Since the close of the last session, the vacancy in the professorship of surgery has been filled by the appointment of Frank Hastings Hamilton, M D, of Auburn, a gentleman every way qualified to discharge the duties of Dr Hamilton over a period of years has been distinguished as an able and eloquent teacher of anatomy and surgery He comes to the institution with the highest testimonials in his favor as a lecturer, and the trustees are happy to say that his appointment has been made in accordance with the unanimous wish of the other members of the faculty The trustees, therefore, feel confident that the duties of the important chair of surgery will continue to be ably discharged and the same unity and harmony, for which the faculty of the institution has so long been distinguished, will remain unimpaired"

At the time of the first appointment to a professorship of surgery, Dr Hamilton was twenty-six The Boston Medical and Surgical Journal, referring to his appointment at that time, said in part, "He is a persevering, industrious student and, therefore, will succeed anywhere. Men of his power and activity, to say nothing of genius, are very much needed in more than half the medical schools in the union Everything goes by management in these degenerate times. To one person fitted by nature for the station of a lecturer on science—in too many scientific institutions—there are ten stupid-headed drags, who neither elevate themselves nor advance the cause of useful knowledge. It is strange that those who have the care and keeping of the honor of medical seminaries do not open their eyes to the monstrous and glaring iniquity of putting cousins, nephews, and almost aunts into chairs which it is not possible for them to sustain with dignity or profit to the world, yet all this is done, to the disgrace of the age while those most competent are left to grope through life in obscurity tion of Dr Hamilton is one of those deviations from the common policy of our medical schools which actually excites our encouragement"

In the following year, Dr Hamilton was made professor of surgery in Geneva Medical College Later in the same year he moved to Rochester, New York, where he practiced until March, 1844 He traveled for seven months in Europe The following year he moved to Buffalo, where he abortly met Dr Austin Flint, Sr, and a lifelong friendship developed

He was immediately appointed surgeon to the Buffalo Hospital of the Sisters of Charity position he held until he moved to Brooklyn in 1859, and his published case reports from his teaching clinic at this hospital, in the Buffalo Medical Journal contain many references to developments original with him in the field of plastic surgery In 1846, Dr Flint and Dr Hamilton, together with Dr James P White founded the medical department of the Univernity of Buffalo Dr Hamilton became its professor of surgery From 1846 to 1858, he retained this position at the University Hardly had he been settled in a new home in Brooklyn, in 1859 than he was appointed the first professor of sur gery at the Long Island College Hospital the outbreak of the Civil War he entered the army as a volunteer regimental surgeon Rather rapidly his responsibility was increased by successive appointments, culminating in that of medical inspector of the United States Army with the then high rank, for a medical man, of licutenantcolonel During the war he became professor of military surgery in the Bellevue Hospital Medical College, where in 1868, he was made professor of the principles and practice of surgery and surgical pathology

It may be said that Dr Hamilton was a master of the extirpative and reconstructive surgery of his day He was particularly interested in the extraction of cataracts, while he was in Buffalo and then, as well as later, in the technics of amputations, in which his work, including the exact choice of site, became authoritative. His interest in tissuo restoration was broader than merely surgical he theorised extensively on the mechanism of the formation of provisional callus he published on the art of obtaining primary union in incised wounds His publications in the field of restorative surgery include a curious account of the regrowth of an entire phalanx after its surgical extraction, an extensive early work on the surgical correction of strabismus, an original technic for blepharoplasty, reports of the correction of ectropion of both upper and lower eyelids by implantation of the pedicle flap, and reports of the surgical creation of new noses, new cheeks, the correction of hare-lip and cleft palate, the correction of tonguetie and of ptosis of the upper eyelid

I find that it was Hamilton who evolved the principle of attaching skin to periosteum in order to secure permanent placement of skin where there is a tendency toward retraction. I need not tell you that this principle is of great practical importance and accounts for the success of the

late Dr John Wheeler's procedure for the reestablishment of conjunctival formers Dr Hamilton is to be credited with also the first suggestion for grafting skin from distant sites to cover the surface of chronic ulcers, and there is some merit in his claim for priority in the actual carrying out of this suggestion, although his claim was disputed by a Dr Watson in an amusing, minor chapter in the annals of medical controversy

During the decade preceding the present one by a century, Dr. Hamilton operated upon all the varieties of cases mentioned above and as well for varus, in which he cut the tendo achilles entaract, glaucoma, pterygium, essentially a plastic procedure, naevus and other tumors of the skin, hare-lip, sarcoma of the choroid with exten sion into the orbit, and malignant tumors of the lins.

Upon one patient afflicted with multiple deformities of the face, he performed blepharoplasty cheloplasty and rhinoplasty First, he corrected the ectropion of the upper hd, mainly by freeing the conjunctiva and tarsal plate, and by excising a portion of what appeared to him to be redundant tarsus. Today, we would condemn this procedure on the ground that it is not reasonable to excise tasue to correct a lesion consisting essentially of inadequacy of tissue amount.

Next, he made a similar attempt upon the lower lid. He immediately recognized his failure, which he ascribed, perhaps narvely, to 'complete inelasticity of the integument below (the lid margin?). He did better when he used a pedicle flap from the temple.

The deformity about the angle of the mouth he corrected by what appears, in a rather vague description to have consisted of undermining and sliding of skin and mucosa

'These operations having been completed, the patient went home to re-establish his health which had suffered some from his confinement and the constant irritations of successive operations'

After the patient's convalescence, Dr Hamil ton restored the right side of the nose by a sliding Then, because he was unwilling to further deform the face by securing tissue from it and although he had previously performed rhinoplasty only by the Indian method of forehead flaps, he now resorted to an original variant of the Venetian method He transposed skin from the hand, having as he wrote "previously tested the courage and endurance of the patient " His brief description of the operation breathes a simplicity nostalgic for a day when life was less complex "On March 29 I dissected from the ball of the thumb of the right hand a piece of integument of a quadrilateral form two inches in length by one and a half in breadth, its longest diameter extend ing from within outwards and its base or point of attachment resting over the radial border of the metacarpal bone of the index finger The palmar portion of this flap was at this time covered with a heavy cuticle The wound was closed as nearly as possible with adhesive plasters, the flap was turned back, dressed with simple cerate, enveloped in cotton, the whole being secured by a few light turns of the roller In six days, about onefourth of the flap had sloughed, the sloughing being arrested by yeast poultices At the end of two weeks, the flap, by sloughing and contraction, had diminished to about half its original size was, however, three times its original thickness and vascular, the thick cuticle had fallen off and left a soft, pliant skin, and edges were cicatrized"

On April 12, a cap with straps, was placed on the patient's head, the flap and the nose were made raw, and by means of a sling to which the straps from the cap were attached, his arm and hand were brought up, and the skin secured to the nose by five small sutures. A pillow was slung under the armpit, against which the elbow rested. Two students now remained in constant attendance, being relieved every four to six hours by others. The patient was kept in this position seventy-two hours, when, union having taken place, the flap was separated from the hand. Of that which remained attached to the face, a small portion sloughed, but sufficient remained to partially complete the ala

Finally, the left ala not complete, Dr Hamilton performed an operation for which he claimed entire originality This operation was possible because a burn had destroyed the roots of most of the hairs within the nostril and also had left the mucous membrane and the subjacent tissue much thickened He raised, by careful dissection, a thick plate covered with mucous membrane from within the nostril, leaving a pedicle downward and at the part of the opening of the nostril which is nearest the external commissure of the mouth. this plate he brought out and attached to the apex of the nose and to the lower border of the attenuated ala The success of this particular procedure "exceeded his expectations"

In the operation for hare-lip prior to Hamilton's time, controversy centered on when to operate and on the choice of instruments. The hoary battle of the kmfe (scalpel to you, Dr. Kildare) and the scissors was raging even then. It was Richter who finally had said, "Every surgeon may and can select the instrument he thinks the most convenient, both have been used with equally good results"

There had existed a prejudice against operating on children with hare-lip before they were two years old Heister had opposed this prejudice, his comments in this regard provide a circumstantial commentary on the surgical milieu of the century preceding Hamilton

"It has been an opinion of the ancients that it is not safe to perform the operation for a hare-lip upon infants before they are two years old, or even till they are four or five, according to Garengeot The contrary of which is taught by experience, from whence we are furnished with instances of infants happily cured of a hare-lip. when they have not been above five or six or even three months old, if they are well in other respects and the operation rightly performed parents are seldom willing to defer the operation so long, and I have seen them so uneasy on this account that they would rather employ an itinerant quack in the operation than postpone it for any time, nor indeed have these mountebanks It is disagreeable to parents often miscarried in general that their children should appear with such a blemish, and it is often of bad consequence to the mother in succeeding pregnancies to have such objects in their presence, by which means the deformity is propagated in the family therefore, I would advise expert surgeons not to be afraid of performing this operation too early, especially when the fissure is but small also a necessary circumstance in infants, to keep them from sleeping a considerable time before the operation, and afterwards to give them an anodyne that they may sleep the better and he still the longer after the operation without moving the lips by crying It should also be observed rather to let the infant lie with its face downward during the operation that the blood may not run down its throat, and set it a coughing though the hemorrhage is often pretty plentiful in performing this operation in young infants, yet no danger can be well expected from thence, for it rather prevents inflamation, and generally ceases after applying the bandage and dressing to the lip"

Although Dr Mutter in Philadelphia and Dr Mason Warren in Boston then held that the operation upon hare-lip should be carried out as early in life as possible, Dr Hamilton believed that the very young infant was more predisposed to postoperative infection and preferred the period during the second year immediately following or preceding dentition. If it was not done during the first few years of life, he found it necessary to wait until there was enough adult understanding to permit the operation to be performed without anesthesia.

In 1858, Hamilton extirpated the entire parotidgland That the parotid had previously been removed had been disputed hitherto, and that it was removed, in this case, for the first time, was confirmed by microscopic examination of the tissue by Dr Austin Flint, Jr It was in this year

that Dr. Hamilton defended with his pen the claim previously advanced by Oliver Wendell Holmes regarding the contagiousness of puerperal The recent teaching of Dr Meigs on child-bed fever and the lecture of Professor Hodge of Philadelphia had reopened the discussion, which Dr Holmes had met by the re publication of his essay

In view of the fact that this material has been prepared for the Historical Session of the Annual Meeting it is, perhaps properly, somewhat discursive Much of it treats of details of the medical career of Dr Frank Hastings Hamilton, who practiced in western New York State the facts presented it is clear that reconstructive surgery was developed in the main by regional surgeons rather than by men who limited their interest to plastic surgery, and that there are sufficient reasons to warrant the conclusion that a good deal of plastic surgery will stay in the hands of surgeons limiting their interest to par ticular regions. It is certain that there are com petent general, as well as regional, plastic surgeons. it is almost equally certain that the work will remain in the hands of those competent

454 Franklin Street

RECORDING MEMBERSHIP AND FELLOWSHIP IN THE NEW DIRECTORY

The information cards received from physicians who have listed their data for the new eighteenth edition of the American Medical Directory, indicate increasingly that many are not aware of the differ ence between Membership' and 'Fellowship' in the American Medical Association.

Here are the official definitions

Every Member in good standing in the con-stituent medical association of the state in which he is engaged in practice whose name is officially reported to the Secretary of the American Medical Association for enrollment becomes automatically a Member of the American Medical Association and is not called on, as such, to pay any dues or to contribute financially to the Association. Members of the American Medical Association

are eligible to apply for Fellowship
To qualify as a FELLOW, a MEMBER in good standing is required to make formal application for Fellowship to pay Fellowship dues and to subscribe for the Journal. Applications must be approved by the Judicial Council. Fellowship dues and subscription to the Journal are both included in the one annual payment of \$12 which is the cost of the Journal to subscribers who are not Fellowa

Members of constituent state medical associa tions pay dues to those bodies, but as Members they pay nothing to the American Medical Association. Fellows pay dues and subscription to the Journal in the sum of \$12 a year which has nothing to do with county or state dues.

According to an amendment to the Bylaws of the American Medical Association, no physician may be officially recorded as a Member of the American Medical Association except on the basis of membership in one constituent state medical association and that one the association of the state in which the physician concerned maintains legal residence and engages in the practice of medicine.

Each Fellow receives a Fellowship Card from the Association annually as payment of his dues is recorded, which card is presented for admission to the Annual Meetings of the Association

Physicians who are eligible for Fellowship should make formal application immediately so that they may attend the Chicago Session and so that a record of their Fellowship may be received in time to include the Fellowship symbol in their data listed in the new American Medical Directory - J A.M A., February 7 1948

MOST DEATHS IN 1947 CAUSED BY HEART AILMENTS AND CANCER

Heart allments and cancer caused 72 per cent of the deaths among Americans last year, according to a recent study of 1,000 000 policy holders of the Mutual Life Insurance Company of New York.

Diseases of the heart and circulatory system were responsible for 57 per cent of the deaths in all age groups and 62 per cent in persons 60 years old and over the study showed. Mortality from cancer was 15 per cent in all age groups. Other causes of death, in order were accidents

kidney disease, influenza and pneumonia, suicide and tuberculosis.

NERVE BLOCK THERAPY FOR PAIN OF LARYNGEAL TUBERCULOSIS

E M PAPPER, MD, and E A ROVENSTINE, MD, New York City

(From the Department of Anesthesia, Bellevue Hospital)

Larryngeal tuberculosis, although comparatively infrequent in clinical practice, may present a most difficult problem in therapy to the phthisiologist, particularly when the disease is far advanced. It is the purpose of this communication to outline the value of superior larryngeal nerve block in the management of some of the distressing symptoms of this lesion. No attempt will be made to discuss the phases of care which are properly the concern of the larryngologist and the internist

Special attention is directed to the patients whose existences are miserable because of severe dysphagia and exquisite pain associated with swallowing or phonation. Occasionally this may be complicated by pain referred to the ear Although many authorities state the prognosis is not necessarily poor, the patients observed here were, for the most part, critically ill, and nerve block was performed as a palliative procedure for the relief of symptoms.

The therapeutic rationale for superior laryngeal nerve block is based upon the innervation of the larynx, its normal physiologic activity, and the changes effected by the lesions of tuberculosis

The superior laryngeal nerves are bilateral They are branches of the vaga and the chief sensory nerves of the larynx, although motor components are present The mucosa of the larynx and epiglottis are supplied by these nerves and transmit afferent impulses which are interpreted as irritation or pain in disease of the Among the many functions of the larvnx larynx are those of assistance in deglutition, phonation, cough, and expectoration It can be seen, therefore, that a lesion of the larynx, such as tuberculosis, may cause considerable pain almost constantly because of the frequency with which the larynx is called upon to perform one or more of the functions listed, and that the pain may be avoided by neurolysis of the superior laryngeal nerves It is apparent also that this procedure is directed toward symptomatic relief and does not necessarily alter the course of the disease

The superior laryngeal nerve is accessible tonerve block above the point of its passage into the larynx through the thyrohyoid membrane, between the great cornu of the hyoid bone and the superior cornu of the thyroid cartilage (Fig 1)

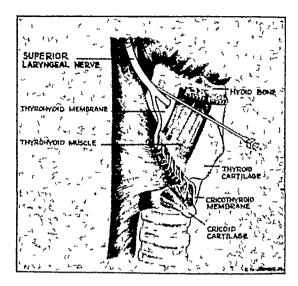

Fig 1 Diagrammatic drawing to illustrate the position and course of the superior laryngeal nerve at the site of nerve block with needle in place

In performing nerve block the patient is placed in the supine position and a skin wheal is raised in the midline just above the thyroid notch (Fig 2) A 5-cm needle is then introduced through the wheal and advanced toward the cornu of the hyoid bone—Injection is completed just below the hyoid cornu with 2 cc of 2 per cent procaine,

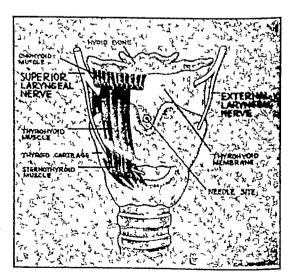

Fig 2 The drawing indicates the location of the skin wheal in relation to the thyroid cartilage

followed by 2 cc of absolute alcohol at least ten minutes later The opposite side is anesthetized in similar fashion through the same skin wheal Successful completion of the procedure results in immediate pain relief which persists for variable periods of time, ranging from weeks to months.

Bilateral superior larvngeal block has been per formed recently upon 15 patients with laryngeal tuberculosis at Bellevue Hospital, for the relief of severe, intractable pain during cough, deglutition, or phonation. All patients had ex tensive pulmonary tuberculosis, which was con sidered hopeless for cure, and all died within twelve months of the onset of serious laryngeal involvement. Eleven of these patients were less than 40 years of age, with the majority in the fourth decade of life. The larvngeal lesions in all instances were far advanced patients were subjected to nerve block once and 2 patients were injected on two separate occaaiona

Excellent pain relief was obtained for 10 pa tients, all of whom remained comfortable for at least six weeks. Three patients had only a fair result in that symptoms were gradiented incompletely for the same period of time, and complete failure occurred in the treatment of the remaining 2 patients. The 2 patients subjected to a second nerve block gained relief from both procedures.

In no instance was the lesion improved but the procedure was definitely of value for most of the patients in the comfort they experienced with freedom from the agonizing pains of the disease It is suggested that superior laryngeal nerve block with procaine and absolute alcohol is a merciful addition to the management of patients with painful larvneeal tuberculosis

Summary

The mechanism of pain in laryngeal tuberculosis is discussed, and superior laryngeal nerve block is recommended for therapy

ANNOUNCEMENT

From the Council Committee on Public Health and Education of the Medical Society of the State of New York

Statement Regarding Proposed Pediatric Consultation Services

The Medical Society of the State of New York and the New York State Department of Health agree on the principle that adequate pediatric consultation services should be available to general practitioners. Such pediatric consultation services are primarily a technic of graduate education which will in the long run improve the quality of medical care to all the children of the State. As such it is of concern to the

two organizations issuing this statement.

Private practitioners should be encouraged to make greater use of pediatric consultation services. For patients who cannot obtain the needed consulta tion services, including indicated laboratory and x-ray examinations, such services ahould be made available to general practitioners through the instru mentality of the public health program on a regional basis radiating from a pediatric center Inasmuch as technics for providing such services have not been developed in detail, it is proposed that a pediatric consultation program be instituted in a single region of the State on an experimental basis. The Buffalo region has been chosen for this demonstration.

In the development of pediatric consultation services, major emphasis should be placed upon consulta nons for groups of patients in such locations that the needed laboratory and x-ray examinations may be readily provided The referring physician is rereadily provided The referring physician is re-quired and other physicians are encouraged to at-tend the group consultation. In connection with such group consultations teaching conferences and other educational devices should be arranged for the ounce consulant. In view of the varying dreum-stances in each case the referring physician must be the individual to determine if pediatric consultation service including indicated laboratory and x ray examinations, is otherwise available to his patient.

Individual consultations by pediatricians have been provided to a limited extent as part of the publie health program for many years No change in policy in this regard is proposed.

INTRACTABLE EDEMA

Clinical Therapeutic Implications

Louis Leiter, MD, PhD, New York City (From the Medical Division, Montefiore Hospital)

THIS discussion will evalude from consideration intractable edema due to local peripheral causes, such as recurrent thrombophlebitis with venous and lymphatic obstruction, inflammatory or neoplastic occlusion of lymph channels, arthropathic, paralytic, or other types of immobilization of lower extremities. We turn, therefore, to the more general types of edema, associated with congestive heart failure, renal disease in its various stages, malnutrition, constrictive pericarditis, cirrhosis of the liver, diabetic glomerulosclerosis, undiagnosed myvedema, hypothyroidism, steroid hormone imbalance, and the rare scleredema

The physiologic mechanisms underlying the development of edema have already been ably discussed by Dr Peters, but at the risk of repetition I should like to re-emphasize the major factors favoring edema under clinical conditions 1 These conditions may be grouped for convenience under renal dysfunction, venous and capillary hypertension, low plasma albumin concentration, sodium intake, capillary damage, lymphatic obstruction or stasis, and excess of salt and waterretaining steroid hormones and possibly pitressin, regardless of their chief site of action factors in edema may be variously combined in clinical situations In fact, there is almost never any single factor operating alone in human Frequently, this has been forgotten by those who have championed some one cause of a certain clinical edema or have as vigorously attacked another investigator's point of view What we must never forget is that the sodium intake is the sine qua non for all types of chronic edema, with one exception, to which I shall allude later

One factor favoring edema that has not yet been mentioned is time. This factor is important, because it takes time for edema to become apparent, clinically, even though several of the other major factors may be active. This is the answer to the catch question, "Why does not every patient with shock and a very low renal blood flow and glomerular filtration show edema, if you blame cardiac edema on diminished filtration of sodium?" If you could keep the patient in shock for a few days and

Based on a paper read as part of a symposium on the treatment of intractable edema before the Brooklyn Society of Internal Medicine May 28 1947

feed him hot salted soup instead of hot coffee, I suspect he would develop edema like the cardiac subject Postoperative edemas are a good example of a combination of diminished renal filtration, an excessive intake of sodium (parenterally), and the revealing effect of time

An understanding of the basic physiologic disturbances in the various types of clinical edema leads logically and actually to more Thus, the early use of successful therapy BAL(2,3-dimercaptopropanol) in arsenic or gold dermatitis with edema due to capillary injury results in rapid subsidence of the process. The proper renutrition of an emaciated, edematous, concentration camp inmate gives a gratifying The timely reduction in dosage of result desoxycorticosterone acetate in an overtreated edematous case of Addison's disease may be These are, of course, relatively easy examples, and do not really belong under the heading of intractable edemas

Cardiac Edema

The mechanism of cardiac edema may be outlined as follows

- (a) "Forward failure" sequence
 - 1 Myocardial insufficiency
 - 2 Decreased cardiac output—relative or absolute
 - 3 Decreased blood flow
 - 4 Renal vasoconstriction, chiefly efferent, release of renin
 - 5 Low glomerular filtration
 - 6 Low clearance of sodium
 - 7 Edema and hypervolemia
 - 8 Venous hypertension
 - b) "Backward failure" sequence
 - Myocardial insufficiency
 - 2 Venous hypertension
 - 3 Edema and hypervolemia
 - Passive congestion of organs
- (c) Exercise—aggravates edema formation from both (a) and (b)

Concerning cardiac edema, we have two clinical goals first, improvement of circulation by the usual regime, and second, dietary control of salt (sodium in any form) within the limits of renal excretory capacity on the one hand and the patient's nutrition on the other. If the first succeeds, the second is no problem or at most a minor one, but chronic congestive failure implies

that improvement of the circulation has fallen short of the mark. Hence, one must concentrate on dietary restriction of sodium or accept the alternative of frequent use of mercurials with all the unpleasantness of violent swings in body fluid, electrolytes, tissue turgor, etc., not to mention other reactions. It is almost like waiting for ketosis each time, before instituting a diabetic regime and insulin, while leaving the latter off in the intervals.

When a patient requires a mercurial once a week or oftener, he is uncomfortable, physically, 50 per cent or more of the time, and almost normal life including some work capacity, is virtually excluded. If he fails to respond to 1 or 2 cc, he soon receives 3 4, 6, or 8 cc in some quarters, all this not infrequently, without any serious effort to control salt in the diet. Even in this great medical city, where patients can shop from one cardiac clinic or hospital to another, it is remarkable how many escape any significant instruction in low salt diets simple example, few hospitals bake salt-free bread and it is quite a shopping feat to find saltfree bread outside of hospitals For this reason, at the Montefiore Hospital we have arranged for decompensated cardiac patients to buy salt-free bread at our pharmacy

Our medical fathers and grandfathers would be amused at the contemporary furor over the rediscovery of the effectiveness of the low salt diet in cardiac edema They knew all about it in the years between 1900 and 1920, when the organic mercurial diuretics were not known Long before 1900, the Karrell diet with its 4 or 5 glasses of milk a day and a sait content of only 1 gm , was a very potent antiedema regime, even though woefully deficient in calones, iron, protein, vitamins, and palatability Its use for short periods is still a very practical and highly effective discipline for a chronically water logged individual, but it carries the disadvantage of conveying to the patient the idea that milk is good for him. He cannot understand then why it is eliminated from his later fuller cardiac diet. However, as the palatability of sodium-free milk is improved this restriction may soon be lifted, permitting the more liberal use of the well known nutritional qualities of milk and its prod ucts in the cardine diet

With sait-free bread, sait-free milk, unsaited butter, and a little plain cottage cheese, the chief hazards of the low sait duet are by passed, provided natural unsaited foods are used as meats fruits, and vegetables with only a few exceptions such as bacon ham, beets kale celery, spinach, and sait water fish. Beware of corn flakes, dry cereal, and oleomargarine, and, of course, canned vegetables or their juices. One can easily arrange in palatable and varied diet containing

only 1.5 gm of salt. In case of severe rebellion on the part of an undernourished or anorexe patient, the additional use of 1 Gm. of salt daily from a salt shaker at the table is permitted. The total salt intake of 2.5 Gm would still be less than half of the ordinary so-called salt poor diet used in many institutions. After the first few morcurials, the interval between injections may be increased to two or more weeks, and in many instances, the patient may be restored to sufficient activity to permit occupational rehabilitation. The change in morale of the patient with chronic heart failure is the most gratifying result. For those whose cardiac reserve is too low to permit physical activity the reduction of clinic visits or medical fees and the decrease in the number of emergencies due to acute pulmonary or hepatic congestion is an adequate reward for adherence to a low salt diet.

Obviously, the less severe the degree of congestive failure the more readily will a good response occur. Our chronic cardiac patient at Montefiore Hospital is a tough therapeutic problem but the diet works on him. We insist that every patient have a scale at home so that he can weigh himself daily and keep a record. The patient soon learns what happens if the diet is broken.

Once the salt content of the dict is limited to about 1 or 1.5 Gm a day, it makes little difference whether the patient is also on an acid-ash diet or whether he drinks 1,500 cc. or 5,000 cc of fluid a day. On a larger fluid intake the patient will excrete more urine, but not much more sodium than on the ordinary intake. The fear of fluid—hydrophobia—should definitely be eliminated by demonstration of lack of persistent rise in weight on adding a few glasses of water or other liquids. What we must instill in the patient's mind is natrophobia—fear of sodium in any form.

Suppose that, notwithstanding bed rest, digi talization, low salt diet, and the proper use of ammonium chloride and mercurials, the patient still remains generally miserable and markedly edematous and cyanotic with venous congection and a large liver? Is there anything else that can be done to reduce the edema safely? My colleagues, Drs Cherkasky and Hellman, have applied the ingenious experimental technic of Darrow and Yannet to remove sodium chloride from the body by instilling several liters of 5 per cent glucose intraperitoneally after removing ascitic fluid *4 The glucose solution is allowed to equilibrate with the blood for two and a half to four hours and then is removed carrying with it many grams of sodium chloride. Usually there is good diures in the next forty-eight hours, since the kidneys excrete the water from

which the sodium has been removed by the peritoneal dialysis

It is possible to lower the serum sodium considerably by this technic without harm to the patient, since he has a large excess of extravascular fluid to prevent the circulating plasma volume from falling to shock levels. Incidentally, the relative comfort of the edematous cardiac patient with a low serum sodium and chloride level explodes the myth of the danger of sodium depletion by rigid diets or vigorous mercurial diuresis. The situation is, of course, quite different in a slightly edematous or a non-edematous or dehydrated cardiac patient, especially in hot weather, or in the terminal cachectic state.

Nephrotic Edema

This type of edema is in some ways much more difficult to manage than cardiac edema. Theoretically, the patient should have a high glomerular filtration, because his renal blood flow is not markedly reduced, if at all, in the earlier stages. The glomerular membrane is not fibrosed enough to reduce filtration, and the decrease in plasma proteins should make filtration easier if the blood pressure remains normal. Yet, in spite of all this, the sodium excretion is reduced and the patient's edema may be very stubborn, even on a low salt intake and after the use of mercurial diuretics.

Obviously, other factors must be operative, especially when, without changes in diet, plasma albumin, or diuretic drugs, there occurs a spontaneous diuresis and loss of edema after weeks or months of little change in weight. No one knows what happens in the kidney or elsewhere to bring about this welcome effect, but there is some evidence that the tubules of a nephrotic patient reabsorb sodium to a greater degree than in the normal or the cardiac patient, and that in a so-called spontaneous remission there is a return toward the normal level. We are utterly ignorant of the details of this process

It goes without saying that, like the cardiac patient, and even more so, the nephrotic patient must limit his salt intake severely In addition there is the added burden of restoring lost tissue protein and body weight, of continually replacing the wastage of proteinuria, and, if possible, though as yet unattainable, the task of elevating the plasma albumin well above the so-called edema level in order to increase colloid osmotic pressure and pull extravascular fluid back into the circulation It must be realized that for every gram of plasma protein lost by proteinuria or malnutration, about 30 Gm of tissue protein disappear 5 Because the plasma and tissue proteins form a joint protein pool, according to Whipple and his associates, any attempt to increase plasma proteins by diet, to be successful, must furnish these 30 Gm of tissue protein for every gram increase of plasma protein A simple example will illustrate the therapeutic problem

Suppose a nephrotic patient has a plasma albumin of 18 Gm per 100 cc instead of the normal 48 Gm per 100 cc, in short, a deficit of 3 Gm of albumin per 100 cc of plasma plasma globulin is normal If his plasma volume is 3 L, he will need 30 × 3 or 90 Gm of plasma albumin to restore a normal level However, before this increase can occur from dietary protem, he must provide 30×90 or 2,700 Gm of tissue protein Assuming that body tissue is 25 per cent protein, the patient must build up at least 4×2.700 Gm of actual tissue and muscle or 10,800 Gm, or about 24 pounds of real brawn, This is all based on the assumptions that proteinuria will not increase as the plasma proteins rise, that regeneration of tissue and plasma protein is proceeding normally in the depleted individual, and that the patient can eat enough calories daily to spare enough protein to permit the continual piling up of nitrogen reserves in the protein pool This is quite an assignment in reconversion, and it is no wonder that a few weeks or months of a high protein diet seems to have so little effect on the nephrotic patient's plasma albumin level

Is there not an easier and more direct way? A biologically economic shot in the arm? Prefabricated human salt-free plasma albumin would seem to be the ideal stuff Given intravenously in hypertonic solution in calculated amount, it should immediately increase the plasma albumin concentration, raise the colloid osmotic pressure, and promote removal of edema fluid fortunately, the powerful colloid osmotic pressure of the injected albumin pulls in enough interstitual fluid into the blood to dilute the protein and reduce the expected increase in plasma albumin concentration Also, much of the injected protein runs out into the urine, and the rest disperses into the tissue fluids, where some is used to rebuild tissue protein, and some is metabolized and excreted as nonprotein nitrogen after the administration of large amounts over a period of weeks that some of the desired effect can be achieved in the adult patient 7. This is a very expensive procedure in terms of human blood when you remember that 25 Gm of albumin require at least 500 cc of plasma or 1,000 cc of To inject 50 Gm daily for two weeks a moderate estimate—means a supply of 28 L or 56 pints of blood Since the effect is only temporary at best, it is clear that there is little justification for the use of this therapeutic measure in the nephrotic syndrome except in infants or young children to tide them over

dangerous periods in the disease, and on rare occasions, its use is justified in the severely under nounshed, totally anorexic adult

More practical measures in the adult are a high caloric, high protein, low salt diet with the use of mercurial dureties, if effective, otherwise, or in addition, the use of potassium intrate in adequate design is generally an effective step. A few injections of gum acacia or gelatin over a short period, as practiced at the Mayo Clinic by Keith and his associates, may start the edema moving but this procedure is not recommended for use by the general practitioner. Ordinary plasma or even concentrated plasma is of little or no value in adults because of the high sedium content and its wastefulness.

The great problem is persuading the patient to eat 3,000 calories daily. All the dietetic arts must be utilized, not merely the science alone. Without the extra calories, the extra dietary protein is largely unavailable for rebuilding tissue and plasma protein, because it is utilized for energy. Protein is an expensive fuel. As in the case of liver disease the calories count heavily

Pre uremic Stages of Renal Disease

When edema develops in the late or preuremic stages of renal disease it is often intractable because of the common occurrence of congestive heart failure on a hypertensive or arteriosclerotic basis superimposed on marked reduction of renal function. Mercurial diuretics are no longer useful and are dangerous if pushed beyond a trial dose The therapy of the patient's acidosis, malnutration and dehydration usually requires the administration of parenteral fluids, and only the finest balance between intake and output can prevent further moreage of edema. This is the one pathologic condition in which edema can be increased by water alone change in the composition of the edema fluid is the usual occurrence, depending on the make-up of the miected solution. For example, the sodium and chloride content of the serum and edema fluid may be markedly lowered by ex cessive infusion of glucose in distilled water, thereby increasing edema and diluting the avail able electrolytes or, in case of increased urine flow, washing them out. The kidney can no longer regulate the chemical composition of the body fluids, and all sorts of bixarre artificial patterns may be produced by administering this or that solution

Cirrhosis of the Liver

The treatment of ascites and edema due to cirrhosis of the liver has been revolutionized by the excellent clinical experiments of Patek and Post and other investigators who have substituted the seven-course dinner for the abdom inal trocar. Now, instead of removing from the body several liters of ascitic fluid and its content of precious plasma protein every few weeks. we make every effort to push into the patient s gnatrointestinal tract calories, protein vitamins day after day, week after week, and month after month The results are often grati the patient's re-accumulation of fluid slows up or ceases entirely, and general nutrition and life expectancy are prolonged, even though hemorrhage from esophageal varices may still terminate the course of the disease. The real lesson to be learned from this therapeutic achievement is the importance of good food in the early treatment of chronic fatty or alcoholic livers and various types of hepatitis, toxic or infectious, years before the full-blown cirrhosis has developed With better methods for diagnosing liver disease and with more attention to early clinical signs of malnutration we should be able to take full advantage of the curative effects of optimal diets Whether, in addition special supplements of choline, methionine, or other lipotropic agents or liver extracts will materially improve the results, over those obtained from diet alone, still remains to be shown.

When parenteral feeding is indicated in advanced liver disease or when the oral intake of a full diet is difficult to achieve, it may be of considerable value to give enough salt-free human albumin, 25 to 50 Gm daily intravenously, to restore some tissue protein rapidly to elevate the plasma albumin to promote diurens, and to reduce the formation of ascites and edema 10 While this effect is temporary, it is much more marked than in the nephrotic syndrome because there is no proteinuria, ordinarily, in liver disease The injection of protein hydrolysates while furnishing a source of nitrogen for the daily requirements of protein metabolism, will not usually lead to the building up of badly needed plasma albumin. For this specific purpose there is nothing like prefabricated human albumin, expensive though it may be

Diabetic Glomerulosclerosis

In diabetic glomerulesclerosis we find two kands of edema, at times intermingled In younger individuals and in the earlier or intermediate states of the disease, the edema is of a nephrotic type correlated with marked protein uria and hyposibuminemia. Renal and cardiac function are still relatively good, although hypertension and diabetic retinopathy are usually present. In older subjects the clinical picture is regularly compilicated by congestive heart failure of hypertensive or arteriosclerotic origin and by more or less severe degrees of renal insufficiency

In this group, edema is likely to become as intractable as in any other combination of cardiac and renal failure. The treatment then becomes essentially that of chronic uremia, not a very pleasant task

In the younger diabetic group with nephrotic edema, the same principles of therapy apply as in any other nephrotic edema low salt, adequate protein, high caloric intake, and judicious use of diuretics

In addition, diabetic management is maintained, since, contrary to what some physicians have believed, glycosuria does not lead to removal of edema and sodium from the body unless ketosis is allowed to supervene should be remembered that in some diabetes with considerable peripheral vascular disease and neuropathy or myelopathy, there may be persistent edema of the feet due largely to local neurocirculatory disturbance, aggravated by unrecognized mild congestive heart failure patients may also have some proteinuria due to renal arteriosclerosis, but little or no decrease in plasma albumin Obviously, this edema is not nephrotic and will not respond to dietary measures, apart from restriction of sodium

Other Types of Edematous Conditions

In the persistent edema, caused by constrictive pericarditis, it is obvious that surgical removal of the thickened pericardium is the only measure that promises permanent relief. If this cannot be done, or if this fails to achieve the desired result, the future treatment is essentially the same as for chronic congestive heart failure, excepting for the use of digitalis. However, with an early diagnosis and experienced surgery, only a few of these patients will not respond dramatically.

The edema of myvedema is intractable only so long as the diagnosis has not been made. This can be a surprisingly long time

Scleredema is a mysterious condition, probably the result of an unusual allergic reaction to an acute infection, distressing and disfiguring while it lasts but, fortunately, subsiding spontaneously in most of the reported cases after some months or years ¹¹

We know so little about the mechanism and treatment of steroid hormonal edemas such as occur in pregnancy, in the Cushing syndrome, in certain ovarian disturbances, and in other rarer situations, that it is perhaps just as well that there is no time left to discuss them in detail Whether insufficient inactivation of steroid hormones or pituitrin by a diseased or malfunctioning liver also plays a role in hepatic, cardiac, and nephrotic edema is still a matter of conjecture and not of fact. It is to be hoped that some of these problems will be settled in the near future.

TEAM OF EIGHT DOCTORS TO PUERTO RICO ON MEDICAL MISSION

Eight physicians, including one from New York, left on January 20 for Puerto Rico to participate in a medical mission sponsored by the U.S. Department of Interior in cooperation with the A. M. A.

Three Chicago physicians, all associated with the University of Illinois College of Medicine are in the group Dr Ernest E Irons, Dr John B Youmans, and Dr H N Sanford The others are Dr W L Benedict of the Mayo Clinic, Rochester, Minnesota, Dr G M Saunders of the Washington University School of Medicine, St Louis, Dr E C Person of the Cornell University Medical College, New York, Dr John H Willard and Dr E D Bond, Philadelphia

Miss Edna Newman of the Cook County Hospital School of Nursing, Chicago, will accompany the mission as a representative of the nursing profession

The purpose of the mission will be to investigate the medical services now available for the indigent in Puerto Rico, and to submit recommendations for the improvement of those services

The medical investigators also will visit the Virgin Islands

Dr Youmans, in addition to participating in the mission, will conduct experiments on tropical sprue (a chronic disease which causes emaciation, anemia, and, frequently, death) in Puerto Rico—A.M.A. News, January 23, 1948

RINGWORM OF THE SCALP IN NEW YORK

ROTAL M MONTGOMERY, M.D. JOHN A HEINLEIN, M.D. and Frances E Karpluk, B A New York City

(From the New York Skin and Cancer Unit, Department of Dermatology and Syphilology New York Post Graduate Medical School and Hospital)

THERE have been many recent reports of epidemics of tines capitis throughout the United States.¹⁻⁴ Most observers have found Microsporon audouini to be the most prevalent causative organism, although there have been studies in different localities which have shown other funct to be the causative factors.⁴

For the purpose of comparison and in order to supplement the existing reports, a statistical study of the cases at the New York Skin and Cancer Unit was made with the findings reported here.

During the eight year period of 1940 to 1947, 2,857 cases, of which 2,379 (83.8 per cent) were caused by M audoumi, of timea capitis were treated in this clinic. During 1941 and 1942, there was a gradual increase in the incidence of M audouini infections. A sharp rise of tinea capitis cases occurred in 1943, accompanied by an abrupt relative increase in the percentage of cases caused by M audoumi This high level has been maintained and demonstrates that the epidemic in New York City and the surrounding area has not abated In 1946, 587 cases of ringworm of the scalp were treated, of which M audoum was the causative fungus in 502 or 85.5 per cent. In 1947, 528 cases were treated, 826 per cent of these were caused by M audonini.

Table 1 lists by years the various organisms found and the number of cases caused by each

In addition to the high incidence of M. audou inl, it will be noted that our series includes 3 cases caused by Trichophyton crateriforms and 4 cases from which T sulfureum was isolated Achorion schoenlenn and T violaceum were more prevalent than the other endothrix organisms just mentioned There were 4 cases of eyelash infection during the eight year period all were caused by M audouni.

In I case of tinea capitis, fuseaux-like bodies on the infected hair shaft were noticed. At different visits microscopic examination of a sodium hydrovide preparation of the hair showed these fuseaux-like bodies. This had not been previously observed at the New York Skin and Cancer Unit. Although Benham, Hopper, and Delamater have verbally mentioned observing them, no reference in the literature to the presence of these bodies on direct examination of fungous-infected hairs has been found.

Further examination and study is necessary to determine whether these bodies are in reality fuscaux or whether they may be epithelial cells or other formations which have split off from the cortex of the hair itself (Fig. 1)

Summary

- 1 From 1940 to 1947, inclusive, 2,857 cases of tinea capitis have been studied at the New York Skin and Cancer Unit. Of these, 83.8 per cent were caused by M audouini
- 2 There has been a sharp increase in ring worm of the scalp since 1043, and a substantial relative increase of infections by M. audouini
- 3 Three cases of Trichophyton crateriforme, 4 cases of T sulfuroum infections of the scalp, and 4 cases of M audouin infections of the eyelashes are reported
- 4 Fuscaux like bodies were observed on direct examination of hairs in 1 case of M audourn infection of the scalp

MAYOR O'DWYER URGES STUDENT NURSE RECRUITMENT IN ILLUSTRATED HOSPITAL DEPARTMENT BOOKLET

In its intensive drive to recruit additional graduate nurses and more students for it snursing schools, the Division of Nursing of the Department of Hospitals, on January 19 began the distribution of 20,-000 copies of a 32-page illustrated booklet with a foreword by Mayor William O'Dwyer, urging young people to consider nursing as a career The Mayor's statement follows

No profession today offers fuller opportunities for young people than nursing Salary levels have been raised and the nursing service in our municipal hospitals now enjoys a 40-hour, five-day week. But beyond that I know of no work that is more soul satisfying than the inner reward that comes from ministering to the sick and distressed, for this is truly one of man's nobler callings vast new horizons open to nurses in hospitals, public health, and industry, the need today is The enrollment of student nurses now will mean more graduates to fill the increasing number of job opportunities that present themselves in both the professional and practical nurse fields I sincerely hope this brochure will present a full picture of nurse training to you so that you may choose nursing as a career

Text and pictures outline the work and recreational activities of student nurses in the Department's six professional schools of nursing, as well as for its practical nurse school on Welfare Island, give entrance requirements, opportunities for the graduate and the cultural and educational advantages of New York City as a training center

The 27 municipal hospitals and homes of this city have a total of 2,314 graduate nurse vacancies and a minimum of 600 more students can be trained in the Department's nursing schools Enrollment in the graduate nursing schools has fallen to 396 students in 1947 from a high of 588 students in 1945, the final year of enlistment in the U.S. Cadet Nurse Corps through which nurse training was subsidized by the Federal Government Nationally, student enrollment dropped to about 40,000 in 1947, from 56,567 ın 1945

The nursing booklet may be obtained free by writing to Mary Ellen Manley, R.N., Director, Division of Nursing, Department of Hospitals, 125 Worth Street, New York City 13, or by calling WOrth 2-4440, Extensions 515 or 516

The recruitment campaign is under the supervision of Hazel Houston, R N, of the Nursing Division

UNION INCREASE UNNECESSARY FOR MEDICAL CARE

It is understood that the United Automobile Workers Union is asking a 30 cents per hour increase in pay for its members, 25 cents of which is to cover the higher cost of living and five cents to cover "medical care"

On the basis of a 37-hour work week, this "medical care" fund would total \$96 20 per year for each employee AMA insurance experts are wondering if union employees have overlooked the fact that they can get very good prepaid coverage for them-selves and their families for this amount Several of the very good medical and surgical insurance plans now available cost much less than \$96 20 annually -Secretary's Report, A M A, February 9, 1948

VIRUS MENINGITIS AND INFECTIOUS MONONUCLEOSIS

STEPHEN B PAYN M D . New York City

(From the Lebanon Hospital, Department of Medicine Service of Dr S Gillow)

THERE seems to be hardly anything in com-I mon between virus meningitis and infectious mononucleosis, yet it may sometimes be necessary to make a differential diagnosis between the two conditions.

Virus, or lymphocytic meningitis was first described by Wallgren in 1925 as acute aseptic meningitis 1 It is characterized by an acute onset with headaches, vomiting fever nuchal rigidity and lymphocytic pleocytosis. In this description there is, indeed, very little that would remind one of infectious mononucleosis with its lymphadenopathy, splenomegaly, and characteristic blood findings Sometimes, how ever, infectious mononucleosis may be complicated by meningeal manifestations

The first clear descriptions of neurologic com plications in infectious mononucleosis were given in 1931 by Epstein and Dameshek and by Johansen 12 Since then, a number of other reports have appeared Their similarity to lymphocytic meningities is striking. Referring to this similarity Epstein calls attention to the fact that there are systemic, as well as blood, diseases which show central nervous system involvement 4 He believes that infectious mononicleous may produce cerebral changes, and conversely, that lymphocytic meningities is merely a manifestation of some, as yet unknown, systemic disease Zohman and Silverman point out that many virus diseases are, in some instances, complicated by encephalitis and myelitis, an indication that the virus has acquired neurotropic properties. They assume that the virus of infectious mononucleosis also becomes neurotropic sometimes
